This, then, was the condition of things: The wind was northeast and I was facing south. The leading decoys were a little south of east of the blind, and the tail ones about south. Any birds coming from east, south or west would swing out in front of me and lead up over the decoys, and I ought to shoot at them just as they were passing over the tail decoys. My two guns, loaded and cocked, lay across their rests, muzzles to the left. Behind me was my chair, into which I would crouch if birds appeared. My clothing was yellowish gray, harmonizing well with the surrounding vegetation. The top of the cane which formed the blind was broken off about breast high, so as not to interfere with the shooting.

As we approached the point in the morning we had disturbed a flock of 200 or 300 ducks and a small flock of geese, which had flown away unharmed to other feeding places. These birds we confidently expected would come back a little later, and now we began to watch for them with all our eyes. For a time, however, nothing came, and I studied the actions of the live decoys. These were having a very good time washing themselves, preening their feathers, and occasionally tipping up to feed on the bottom. After a while one and another of them swam up to its "stool" and clambered on it, standing there and arranging its feathers. From time to time the drake would call to the ducks and they would answer him, and when a buzzard or a blackbird passed over the water all three would call earnestly.

COUPLES.

[TO BE CONTINUED.]

A MOOSE HUNT IN NEW BRUNSWICK.

FOR the history and geography of New Brunswick I must refer you to the books, but if you are interested in big-game hunting I think that the following tale (a true one) will interest you:

Three years ago I killed a bull moose way down in Maine, and I thought then that I should not care for any more moose hunting nights for many years to come; for in order to get him I spent many a long, dreary, cold night calling, cramped up in the prow of my birch-bark canoe, which I had entered before sunset and never once leaving it until after sunrise. Toward dawn sometimes it was an open question which I most desired to see: the sun rise and a cup of hot coffee or a bull moose.

But in spite of former hardships and privations the hunting fever came on again this fall, and on Sept. 10 I packed my traps and left for the wilds of New Brunswick to try new hunting grounds and to see if I could not break the record; for I had heard that there were monster moose up in that unknown wilderness.

I left St John, N. B., via the Intercolonial Railroad, which is advertised as "the fast line," in irony I suppose. After several hours' ride I got off at a little station, hired a team and drove twenty miles to the last settler's house, where I hired another team and drove some twenty miles more, still further from civilization, over an execrable road, so dangerous and so rough that I was often reminded of my latter end. At last we came to a river, and were glad at the prospect of a change in our mode of travel, though it did not prove to be any easier. We loaded all of our stuff into a couple of *pirogues* or dugouts, which were 28 and 30ft. long, and spent the better part of two days wading, poling, hauling (and I was about to add swearing, but that would not be true). With a little less water that so-called river would have made a very good road; yet in places it was deep, rocky and rapid enough, as we found out to our sorrow when one of our dugouts got capsized and we were obliged to plunge into the cold stream to save our clothing and provisions as best we could. The river was so full of trout, grilse and salmon that they fairly jostled each other, and I mourned over the fact that it was the close season and that I did not have my fly-rod. At the point where we left the river we pitched a shelter tent and stored some of our provisions, for we had more than we could carry in one trip. When the guide returned to get the things he found that bears had torn down the tent, eaten our pork, and had gone off with a jug of molasses and a stiff hat. After we left the river we made a long, hard day's carry of about ten miles, and pitched our tent at last, just at dark, in a balsam grove in the very heart of that vast, wild and unbroken wilderness, through whose trackless wilds the southwest and northwest branches of that splendid salmon river, the Miramichi, flows. We named our camp Camp Indian Devil, in honor of a mysterious lake by that name which was supposed to be within a few miles of where we were camping. This lake had never been seen by but one sportsman.

Early the next morning Arthur, my guide, and I struck out to look for moose signs and to select a good calling place from which to call moose some night. Unlike Maine, all the moose calling in N. B. is done on the land, and on that account is both more exciting and more dangerous. For if the enraged or wounded brute should charge upon you and you could not drop him before he reached you, it would probably be your last moose hunt, save in the "happy hunting grounds." But if in a canoe, and a moose should charge, you could easily slip away. I doubt if there is an Indian moose caller in the State of Maine who could be hired to call moose at night from the land, even if he were allowed to carry a rifle. My guide called many a night without a rifle. Toward the middle of the afternoon we found fresh tracks headed toward Lake Indian Devil, but as it was getting late and we had to find our way back to camp as best we could, for there was no trail through the woods, we decided to return to camp and to try again the next day to find the lake, and to come prepared for calling and to stay out all night.

The next morning gave every promise of a splendid night. The moon was at its full, and all signs pointed to a bright moonlight night, clear, cold and still, just the night for calling.

After taking a "bite," or "grabbing a root," as they say out in the Rockies, we began to get ready for the tramp and for an all-night call at the lake.

Since I had done a little pardonable bragging about my game hunting out in the Rockies, my guide took it for granted that I could tramp, carry a pack, rough it, and

sleep out nights (or try to) just as well as he could. And of course after what I had said I was obliged to keep up my end. We rolled up our blankets, putting in them some "grub" for a couple of meals and a small tin pail in which to 'bile tea." Arthur slung on his pack, took his axe and started. Putting my pack on one shoulder and slinging my Winchester rifle (.45 90, model '93) on the other, I followed. We struck right out through the woods without any trail in a southwesterly course, following our compass and the sun, all the while keeping our eye peeled for a large, smooth-barked, white birch tree (which were as scarce as moose) from which to make a horn to call with. We succeeded in finding one, though it took us out of our course and used up precious time. After making and trying the horn, we consulted our compass and hastened along as fast as we could, for we wanted to reach the lake a couple of hours before dark in order to select a calling place, study the wind and allow time for our scent to die out. As we were going through some thick underbrush I snagged a big hole in the bottom of my rubber boot, which was hard luck, for we had to cross a wet bog and to ford a stream, and the water felt as if it had just come from a glacier. Changing our course slightly toward the east, we left the woods and came out into a marsh, which grew more and more wet as we proceeded, and the trees smaller. We felt sure from these signs that we must be nearing the long-looked-for lake. It was almost dark and we had no time to spare. "There it is!" said Arthur, pointing through a small clump of pines to the right. I looked and got my first glimpse of Lake Indian Devil. It is a beautiful sheet of water, about one mile long by one-half wide, and in the shape of a pair of spectacles. It is entirely surrounded by heavy timber, except at the narrow neck of land from which we approached it. This neck of land led to or ended in what was really an island, and was marshy and dotted over with pine trees and bunches of hardhack.

We proceeded carefully lest we should scare any game which might be in sight on the shores of the lake. It was now past sundown. The full moon was just rising over the tops of the trees. It was clear, not a cloud in the sky, frosty and almost a dead calm. We were stealing along, speaking only in whispers, keeping out of sight as much as possible, and trying to reach the island, thinking that would be a good place from which to call; for it commanded a pretty good view in two directions, and the wind would be in our favor. We had almost reached the island, when we were startled by a peculiar noise just off to our right. We both stopped and listened. "There it is again!" whispered Arthur; "it's a moose." We realized we could get no further, and it was hardly safe to move; but we managed to creep on our hands and knees just a few feet and crouched behind a little bunch of hardhacks. Just as we got there we heard a tremendous splashing in the lake not over 200yds. off, and we listened almost breathlessly to one of the most ferocious battles between two mad bull moose which was ever fought by those huge and powerful brutes—the largest which roam on this continent. The uproar and confusion made by those two infuriated bull moose—those monarchs of the forest—was something terrific, appalling, never to be forgotten. It was a battle apparently to the death. As the bulls rushed together to lock their great antlers the splashing of the water and clashing of their horns could be heard for miles on that still, moonlight night. Oh, what would I have given to be nearer! At last one was driven off or killed, and all was deathly still again.

We waited a while and gave a low call; no answer. Then A. drew the horn through the hardhacks, making a sound similar to that which the moose makes with his antlers. Evidently the victor thought he heard another or a fresh challenge, for immediately he gave a grunt and started toward us. Then the excitement commenced again. He came straight on, grunting. I dropped on one knee to keep out of sight and to take steady aim. When he got to the edge of the woods, about 150yds. off, he stopped to listen and to peer out into the opening. Then he started off as if to circle us, when A. gave a low call. He turned and came grunting out into the clearing, but too far off for a shot at night. He stood there fully three minutes (I thought it was three hours) and never made a sound or move except to swing his great head from side to side. We expected to see a big one, but this fellow surprised us. He was immense. He really looked bigger than an elephant. It was a grand sight, those great antlers shining in the moonlight. I kept my rifle on him all the time, admiring him, hoping he would come nearer, and yet fearing I might not get him. We were afraid to change our cramped positions in the least, although I had one knee on the ground. That lump would come in our throats and we could hear each other breathe.

The tension of the muscles holding the rifle so long in that position and the excitement of the mind became painful, so that it was a positive relief when the moose moved back into the woods out of sight, and gave us a chance to change our positions a little But he was no sooner out of sight than I wished I had fired and taken my chance. I feared I should not see him again, and we both agreed that he was the biggest fellow in the woods. We could still hear him grunting as he stalked through the timber. Arthur broke a couple of dry sticks and rasped the horn on the bushes.

Immediately the moose gave a loud, savage grunt, and started for us. He was ready now for another fight, for he came faster and grunted louder. A. crouched on the ground and I dropped on one knee again with my rifle to my shoulder, determined to fire this time if he came in sight again. On he came, nearer and nearer, grunting and taking great strides. He was mad clear through, and evidently intended to make a charge upon us this time. The excitement was intense as we waited and listened and watched in the direction from which the bull moose was coming with all our ears and eyes. As he broke out of the woods he looked bigger than ever, perhaps because he was so mad and full of fight

On he came. I was in for it now, and must either get his pelt or he would have mine There was no shelter or tree to climb, and we had but one rifle. When within 50yds. he angled off a little, and fearing he might scent me I fired. He stopped and looked straight at me, as if undecided whether to charge on me or not. As he stood there his great antlers cast his body in a shadow. I fired three times more as quickly as possible. At that he turned and started for the woods. I jumped to my feet, and gave him two more shots before he got out of sight. I felt sure I had given him a death shot, or he wouldn't have stopped in his mad charge, though firing at night at that distance is uncertain. I expected to see him drop every minute, and when he disappeared in the woods I was terribly disappointed. I feared I had lost the biggest moose of the forest.

Soon after I thought I heard him breathing hard, and I whispered to Arthur, "He's my moose." We decided it was best not to try to follow him until daylight, for it would have been impossible in the dark woods, besides it was best to let him lie down and get stiff from his wounds.

We went onto the island, which was heavily timbered, groped our way about at midnight, built a fire, thawed out, "b'iled more tea," rolled up in our blankets and lay down on the ground beneath the big trees, and tried to get a little sleep.

I lay awake a long while watching the shadows in the woods made by the moon, the blue sky and the stars as they peeped down at me through the tall trees. At intervals all through the night the stillness was broken by a beaver striking his tail in the water. It sounded like a clap of thunder. At last I fell asleep thinking of Indian devils and wondering if I should find my moose in the morning. As soon as it was daybreak we started. We soon found the trail—as we supposed—but no blood, which was a bad sign. We followed the trail round onto the other side of the lake, and there in the water about 100ft. from shore lay my moose, a portion of his body and one antler showing out of water. We threw up our hats, shouted and danced, two of the happiest and proudest hunters you ever saw. After we had shook hands and danced again the serious question arose as to how we were to get those great antlers and scalp which were way out there so far from shore and in 4ft. of cold water. We made a raft, and by using it and wading we succeeded in getting our prize to the edge of the lake, where we soon took off his scalp and antlers. We were not mistaken about his great size. I found that I had put three bullets into him, two of which were dead shots. How he managed to go as far as he did was a mystery.

We had a lug, but finally succeeded in landing our prize in camp, where we had another jollification. You ought to have seen the boys' eyes stick out. They one and all agreed that it was not only one of the very largest, but also the finest moose head ever shot in New Brunswick. As I remember the measurements, the antlers had a spread of over 4½ft., width of blades 12 to 13in., and nineteen or twenty points. Both antlers were perfect and well notched. The blades were finely curved. According to New Brunswick custom, since I had killed a bull moose to the call at night, I must sing a song, which I did with great gusto amid shouts of applause. Since both the words and tune were original, I will spare your patience, fearing that I have taxed it too much already.

I also shot another moose and three caribou, but as Kipling or some one else says, that is another story.

Col. C A. Hopkins and E. B. Holmes, Esq., of Brookline, Mass., were with me. My guide was Mr. Arthur Pringle, of Stanley, N. B., who is one of the best moose callers and all-round guides in all New Brunswick.

To the ambitious hunter who seeks fresh and practically unlimited and unknown hunting grounds, big moose and big caribou, I recommend the New Brunswick wilderness, although difficult of access. Hoping you will brave the hardships and be rewarded as I was, I remain yours truly,

E. A. SLACK.

BROOKLINE, Mass., Dec. 1, 1896.

MAINE GAME LAW VAGARIES.

BOSTON, March 6.—One of the most peculiar pieces of game protective legislation asked for at Augusta, Me., this winter is a law to prevent the trapping of foxes. The promulgators of the measure are the lovers of fox hunting with hounds, and there are a great many of them in that State. The measure is reported to have originated with the fox hunters of Lewiston, Auburn and Buckfield. In these cities and that town are some of the finest strains of the foxhound to be found in the country. The lovers of following them declare that under the present practice of trapping foxes are rapidly becoming extinct. One petition from Lewiston and Auburn alone has over 1,000 signers, praying that the trapping of foxes be prohibited by statute. The measure will be bitterly opposed by the farmers outside of the cities, who are also generally poultry raisers. They have always regarded foxes as "varmints" of the worst kind, and have welcomed any method of destruction that promised to lessen their numbers. There are many trappers of foxes, themselves farmers, living in the sparsely settled and mountainous districts. Some of these trappers secure large numbers of foxes every season, disposing of their furs in the spring. There are numerous records of trappers taking forty, fifty, and even up to seventy-five and eighty foxes in a season. The hounders look with displeasure on such trapping, especially when going over the same ground with their dogs and not being able to start a single fox. Hence the bill to prevent trapping. The bill is being urged by the officers of the various fur clubs at Brunswick, Buckfield and other towns.

The guide bill is being more and more opposed. It seems that the guides are really awakening to the features of the measure, and are more and more opposed to it. One sensible guide, writing from Andover, Me., says that he is opposed to having to take out a license, and can see no more reason why he should be obliged to do so than to cut wood or haul logs. He says he is willing to obey the game laws, but is opposed to being registered or to being obliged to make out returns concerning the parties he guides and the sections he visits; says that the recording of the fish caught and the game taken would be giving the "whole thing away" for some other party to run over. He pronounces the whole measure the worst kind of a farce. As for wearing a badge, he says he wants nothing of the kind. If the commissioners insist on his wearing it he will wear it inside his bootleg. As for the guides making out returns, he says that not many of them are capable of doing so. He mentions an instance of a horse trade of his own with a fellow guide, who wrote him a letter. It was as follows: "Der Sur: mi hos ast $10025; yu hav hem fur that." He was able to English the letter; the guide wanted $125 for the horse, but considering this too much he sent $100 and got the animal.

But the guide license bill is really in a bad way, according to the latest reports. It has been before the Committee on Fisheries and Game three times. The last time it comes out shorn of the badge; with the compulsory registration made optional, though the Commission reserves the right to register any guides. It is also deprived of the clause calling for returns. Alas, for Mr. Carlton's great measure, if it must go through the Legislature in this way! The latest reports are that it is again tabled in the House.

Still the legislative cranks never give up. A lawyer, who ought to know better, has just introduced into the Maine House of Representatives a bill which proposes to make bicyclists take out a license in that State, in order to have the same rights as other people on the streets. No bicycle shall enter upon any road or highway without first having been licensed at an annual cost of $1. Ten cents of this money is to go to the town clerk and the balance to be used in repairing the highways and in keeping them in order. Why not make wheelbarrows pay a license fee? Then there are carts and drays; why should they go untaxed?

Another lawyer proposes to stop Sunday fishing. It has long been a peculiar feature of the Maine fish and game regulations that Sunday is a close time on shooting and hunting, but nothing is said about fishing. The lawyer's new bill proposes to make Sunday a close time on all fishing. This bill may pass, but the peculiar feature of it will be that no attention will be paid to it, unless in case of peculiar spite or desire to injure. Commissioner Carlton is also out with the following proposition: "Whoever on the Lord's Day fires or discharges any rifle, shotgun, pistol or other firearm, except as an act of necessity, shall be punished by a fine of $10 and costs of prosecution for each offense."

But the Seventh-Day Adventists are after this measure. They appeared at the hearing with considerable aggression. Two of them—one an elder and the other a layman—appeared with Bibles in their hands and cited holy writ to Mr. Carlton. It is reported that the bright Kennebec lawyer and fish and game commissioner, who is also a student of holy writ himself, found rather more than his match. The crowd which gathered at the hearing is said to have been decidedly entertained. The committee voted to report the bill, but with an amendment that it shall apply to cities and large towns only, lest it should be made illegal to fire a gun in the backwoods of Maine on Sunday.

SPECIAL.

IN UNHAPPY CUBA.

HAVANA, Cuba, Feb. 20.—*Editor Forest and Stream:* It is a long time since I have written a line to FOREST AND STREAM, though my interest in it and the wholesome sports which it advocates and represents has not lessened. It is a long time, too, since I have fired a gun at game of any kind, and the pleasure I now have with rod and gun is one of memory only—a memory associated with a past time, when peace reigned throughout this beautiful and fertile island, and every one sought happiness and prosperity in such ways as best pleased him. But the present unhappy condition of Cuba, where life and property have undergone such wholesale destruction that desolation, grief and fear reign supreme, saddens the heart and destroys any zest for pleasure. Our domestic deer and quail are therefore little hunted now.

For many months there has been such a condition of affairs, one so sad that the inclination for sport with the gun is deadened, and so serious that one could not actually engage in sport even if so inclined. The horrors of war are visible everywhere. In a large part of the island, where once were peace and a flourishing people in a fertile land, there are now sugar and tobacco plantations laid waste and deserted, families scattered or partly lost, costly machinery destroyed or rusting into worthlessness, homes and buildings pillaged and given to the flames, and the cattle driven away or destroyed. And the destruction is constant and goes steadily on. It is now but a large fighting ground, with all the horrors and losses which come from war.

In the great war between the States the center of active warfare was so far removed from the people at large, and confined to such a small area as compared with the whole dominion, that the people witnessed but little of the active horrors of war. Most of them knew of war only as they read of it. Here we know of war as something at our very doors.

So it is that snipe and ducks can come here to rest at the end of their winter migrations with a safety unknown to them in times of peace. The favorite haunts of the migratory birds, hence a favorite shooting ground of those who used the shotgun, have lost their glories in the greater glories and greater griefs of present war.

Our winters are so mild and balmy that those from the States who spent their winter months here must now suffer a loss by being forced to remain at home. The range of the thermometer between November and March is from 70° to 80° Fahr., with an occasional though rare drop to 60°.

In reply to your inquiry concerning license, the following is a summary of the matter:

Our privileges in the legal use of firearms were subject to many restrictions, these requiring the payment of a tax which added materially to the revenues of the Government, and consequently served indirectly to protect the game. There were six classes of license: one for the use of all kinds of arms not otherwise prohibited, one for the use of firearms for the defense of rural property, one for the use of a pistol or revolver for personal defense outside of cities or villages, one for the use of pistol or revolver for personal defense inside of cities or villages, one for the carrying of a fowling piece and to use it, and one for fishing in rivers, lagoons, tanks and pools. Those concerning pistols and revolvers are restricted to the use of Spaniards, while those concerning the carrying of fowling pieces and fishing are free to all, though an honorarium in the form of a piece of gold may add greatly in reducing any possible friction. All licenses may be revoked at any time. The license fee permitting the carrying of a gun is $11 in gold, and for the privilege of shooting quail or deer on sight a second license must be secured at a cost of $11, making a total of $22 for the year. The shooter must secure a written permit of the landowner on whose land he desires to shoot, or must be accompanied by some one who has such permit.

Perhaps there may be a hope that in the near future the guns of war may be put by to rest, and the shotgun, whose use brings health and pleasure, may then again become the favorite weapon.

SPORTSMAN.

"The Great West."

A NOTE from Mr. Frank Henry Howe, a son of the author of the book "The Great West," tells us: "The book had a sale of more than 100,000 copies instead of 40,000. The author was the son of Gen. Hezekiah Howe, who published the first edition of Webster's Dictionary at New Haven, Conn.; and the first introduction to literature of Henry Howe was the carrying of the proof sheets of Webster's Dictionary from his father's printing office to the home of Noah Webster. Henry Howe died at Columbus, Ohio, in 1893, at the age of seventy-eight. In Appleton's 'Biographical Cyclopedia' can be found a sketch of his life; but a more complete sketch, with reminiscences of Henry Howe, can be found in the back part of the first volume of 'Historical Collections of Ohio,' which can be seen in the Chicago Public Library."

CHICAGO AND THE WEST.

The "Black Duck."

In regard to recent mention of the black duck breeding grounds, made in these columns by Mr. W. B Wells, of Chatham, Ontario, and Mr. Thomas Johnson, of Winnipeg, Mr. Geo A. Boardman, of Calais, Me , writes me as below: "In the last FOREST AND STREAM I see your remarks about what is called in the West the black duck. What the shooters in Minnesota call the black duck is our scaup duck (*Fulis marila*), called also here blackhead, also bluebill. Our Eastern black duck is only accidental in the West. I have been several seasons in Minnesota and one of the old duck shooters on the Minnesota bottoms shot one of our real black ducks, the first one he ever saw. I told him the name and got it mounted for him as a curiosity. This scaup duck is very plenty there and is a diving duck, not very good eating, and I have always heard them called in the West black ducks. They are of two sizes, same color, and I can see no difference, only size."

In this part of the West and in Minnesota and other sections I have often heard the bluebill called the "blackhead," "blackie" or "black jack," but never the black duck, which I fancy is locally restricted in this country. We never heard it called the scaup in this part of the West. Mr. Boardman speaks of its "two sizes." I think he will find the smaller duck called also the ringbill, and a clear distinction is made between the two in the shooting of this part of the country. I have never heard the real black duck or dusky duck called by that name in this part of the West, but it is commonly called the "black mallard," more rarely the dusky duck. In Ontario it is called black duck and mallards are called "gray duck."

Speaking of Mr. Boardman's "smaller" bluebills, I think if he had the two together he might see a difference in the marking on the bills between the ringbills and the bluebills. At first look the birds are exactly alike except, as he says, in regard to size. I speak now only from memory, not having the bird at hand for examination.

Mr. John G. Smith, of Algona, Ia., writes as below to add his quota to the black duck fund of information:

"I was very much interested in your 'black duck' article of Feb. 20. In my younger days I killed quite a good many black ducks on the meadows near Boston and on Cape Cod. I had a lot of live decoy ducks, which were quite well trained to call, and I always found the black ducks quite easy to decoy.

"I have seen three black ducks killed in northwest Iowa. In 1872 Hon. Perry Belmont killed one that came to a wheat field with a lot of mallards. When I picked up the ducks I was very much surprised, as I did not think they ever came West. That same fall my brother shot one that was with two mallards near Buffalo Fork, in this county. Some years after my brother and I were coming down the Des Moines River in a boat and he shot one that was with three or four mallards; two of these were drakes and one a duck. Their habits are very much the same as those of a mallard They have the same 'quack,' and their movements are alike. I have never known any to breed here.

"The velvet scoter (*Oidemia fusca*) is often killed in northwestern Iowa. They fly with the canvasbacks. I have never seen over two in a flock of canvasbacks, and think they must be strays. Their flight is a little different from the canvasback, and I have always found them in poor condition. When I am shooting and notice a strange duck in a flock I always try to kill it, and have let many a fine canvasback slip by while trying to shoot the stranger."

The Sixth Sense.

Some very interesting speculations are at times indulged in upon the question of a "sixth sense" in some of the lower animals, more especially the dog. Not a few philosophers say that in mankind this additional faculty is dormant, and will yet be evolved to the dignity of a separate sense. Allied herewith are all the separate questions of mind reading, telepathy, thought propulsion, etc., etc., which are things but barely dreamed of in our philosophy to-day.

The other evening down at the Calumet Heights Club a few of us fell to talking of these things, and the conversation took the form of relating such incidents as came to the mind of those present of evidence of a "sixth sense" in the dog, or some ill understood faculty by which that animal did things which would appear impossible did it rely entirely upon the recognized senses of touch, taste, sight, hearing and smell. One gentleman spoke of the case of a North Side butcher who owned a dog in partnership with a brother. The latter went to Joplin, Mo., and the dog was sent with him. Some weeks afterward the dog disappeared from the Missouri town, and after a time appeared at its accustomed haunts on the North Side in Chicago. He was gaunt and worn, but apparently glad to get back home. No one has ever been able to tell how he got there or how long it took him to make the trip. How he knew which way to travel is the question which bothers his owner.

I recalled the case of a friend of mine, a Mr. W. V. Smith, who lives out on Washington Boulevard, near Fortieth street, this city. Mr. Smith had a dog which did not please him, and he wished to get rid of it, the affection of the creature extending to personalities such as jumping upon a new pair of trousers with his muddy feet, etc., etc. Mr. Smith did not wish to kill the dog, and so resolved upon the less humane idea of turning it loose in the down town streets of the city. The dog had never been down town before, and Mr. Smith took him in on the Wisconsin Central steam cars. He turned him out into the cold world near the Board of Trade, and thought that he had at last solved the question of getting rid of the dog. That night when he went home the same dog greeted him at the front doorstep and planted a pair of muddy but affectionate front feet on Mr. Smith's trousers. I am glad to say that his owner gave it up then and there, and never tried again to lose the dog. The latter lived the remainder of his life in the family and died there of old age not long ago.

Yet another gentleman spoke of a dog which belonged to a member of the Calumet Heights Club, who lived at Blue Island. The latter place is a suburb of Chicago, some fifteen miles out on the Rock Island road. The dog was raised there, and had never been down town. The Calumet Heights Club is on the B. & O road, some thirty miles from Chicago, and perhaps nearly that far in a different direction from Blue Island. One day this gentleman took the dog into the city with him, as he was intending to go on out from the city to the club, and wanted to take the dog down to the club to leave him there for a time. At about dusk he arrived at the club, *via* Chicago, with the dog, and soon was comfortably engaged in having a good time, forgetting for a time that his dog was more of a stranger there than he was himself The dog came to the club house door once or twice before midnight and whined to be let in, but was repulsed and rebuked. Nothing more was heard of him at the time, and in the morning his owner could not find him. He left instructions for the dog to be tied up if found, and was forced to go on home without any word of his missing animal. When he got home to Blue Island he found the dog there ahead of him. There had been no possibility that the dog could know the way either to the city, to the club, or from the club to his home at Blue Island. It was a mystery how he knew which way to go, yet he did know.

Still another gentleman, Mr. L. J. Marks, who took part in the conversation, related a story quite as strange as the above. Mr. Marks said that some years ago he and Mr. Alex Loyd were engaged together one evening in an attempt to do some excavating about an old boat which had been wrecked on the beach about a mile or so from the club house. When they went out to their work they were accompanied by several of the dogs about the club house, among these two dogs belonging to Mr. Sam Booth, one of the club members. They dug away for an hour or so at the boat, which was half buried in the sand, and in the meantime the dogs busied themselves by romping and playing around in the sand. While this was going on it came time for the arrival of the railway train at the club station, which was something like a mile or more across the sand hills from where they were. The men heard the whistle of the engine presently, and in a few moments one said to the other: "It is just about time for the club wagon to be starting over from the station to the house." A moment or so after this all the dogs started off down the beach toward the club house on a stiff run. About a hundred yards or so from the place where the men were working three of the other dogs turned back and came back to the boat, and made no attempt to go on with the other two, which continued on a run to the house. These two dogs were those belonging to Mr. Booth. Before they started for the house they had both stopped, thrown up their heads and looked off over the hills toward the wagon road, which it was, of course, impossible for them to see in any part from that spot, and which was over a mile distant. Then, as though they had received word or heard a direct call, they started on the run and left their companions, who seemed to understand all about it. When they so started off Alex Loyd remarked quietly, "Don't you see, Sam Booth's on that train, and he's coming over in the wagon now." And this indeed proved to be the truth. Yet there was not any regularity whatever in Mr. Booth's visits to the club, and he never came oftener than once a week. No one knew he was coming that evening. Both Mr. Marks and Mr. Loyd agreed that the dogs must have smelled him and recognized the scent; or if that were impossible, that they must have known of his presence by some faculty unknown or unrecognized by man.

When Mr. Loyd and Mr. Marks made known their facts as above at the club house, there was some discussion over the matter, and all agreed that it would have been out of the question for the dogs to scent any human or other being at that distance. "I don't know about that," said the club keeper, who lives at the club the year round and who has charge of the dogs left there by members of the club. "I'm ready," he continued, "to believe even more than that. You know that we are not so very far from the city here, and once in a while some of the tougher elements of the city wander down in this direction. It is not unknown that a prize fight now and then is held in this wild country, near Whiting, Millers or some of these little way stations out of the ken of the city or county authorities. I remember that not long ago one morning all the dogs about this club house ran down on the beach, and all headed up the beach, standing there and barking like mad for two or three hours, their hair standing up on their backs and every motion showing them to be much excited over something, though they did not make any effort to leave their place or to run off after anything. I learned on the following day that a party of these prize-fighting toughs had come down by boat and had landed on the beach for their little entertainment early in the morning. This was at a point between four and five miles away; yet I know that those dogs smelled the men or knew about their being there through some channel of information other than that of scent. Of course it sounds unlikely, but these are just the facts."

This sort of thing sounds a bit uncanny to our ears now. To the ears of folk following us a distance of a century or so in time they may not seem so strange. A few centuries ago they burned dogs as witches sometimes because they did not understand dogs. We do not yet understand all about them, though we have ceased to burn them for what we do not understand.

Wisconsin Game.

Feb 13.—Mr. Val Raeth, business manager of the *Wisconsin Vorwärts*, of Milwaukee, Wis., has a long article in the columns of the Milwaukee *Sentinel* this week upon the subject of game protection in Wisconsin. Mr. Raeth thinks that the growing demand upon the State game requires immediate action if the game of the State is to be preserved in any considerable quantity. He is in favor of a State and non-resident license, laid for the purpose of raising a warden fund, all wardens to be paid salaries. He is not in favor of selling any game at all. In many of his positions he is sound, as for instance in his views as to the amount of game any one person should be allowed to kill or take from the State; but in his notion about spring shooting he takes up the fallacious tenet now prevalent in Wisconsin, that Wisconsin ought not to forbid spring shooting until Illinois does. This interstate watchfulness and jealousy is quite different from the idea of uniform game laws between the States, and is far less worthy. In the matter of non-resident hunting, more especially for deer, Mr. Raeth quotes FOREST AND STREAM as to numbers of deer hunters who visited the State last fall, and is of the opinion that between 5,000 and 6,000 deer hunters were out in Wisconsin the past season after deer, "and their number would have been increased to 7,000 had our Supreme Court not spoiled the game." He complains that non-resident hunters do not observe the State laws, but openly violate them, especially in the matter of using dogs, which is forbidden by the law. Mr. Raeth goes on to say the following words of warning and advice, words which non-resident hunters might do very well to heed, for it is to the interest of the non-resident hunter as well as the local hunter that the game be preserved, if both expect to hunt for it upon the same ground:

"During the last few years Wisconsin has been the most attractive territory for all kinds of hunters, because the States of Michigan and Minnesota and others demand of every non-resident hunter a license fee of $25. In case Wisconsin fails to do the same thing, most of the hunters of this country will abuse our ill-advised liberality, and within a few years game will be extinct in this State. The same would be the case with the fish in our lakes.

"Several Supreme Court decisions affirm that fish and game are 'common property,' therefore the State is duty bound to fix by law the share each one of us may have of these gifts of nature to mankind. At any event, no one has any right to pursue hunting as a business, and under no circumstances should the State any longer allow game to be considered an article of merchandise. If the 'market-hunter' cannot sell his game, he will be compelled to give up his murderous vocation, and if the Illinois fisherman (?) can only take 20lbs. of fish with him he will not rob our lakes of 445lbs. of fish at one fishing.

"If the privilege of hunting any kind of game in this State can only be secured by obtaining a permit from the State, and if shipment and sale is regulated as above suggested, it will only take a few years before the forests, swamps and lakes of Wisconsin will again be alive with fish.

"It is to be hoped that our legislators will enact a law in harmony with the above suggestions, in order to secure real protection for both game and fish."

"The Last of the Trappers."

A Chicago daily reporter found a good story the other day in the presence in Chicago of two trappers from Montana, near the Flathead country, who had managed to lose the trail in Chicago and wound up in the police court. These men were natives of New York, and were on the way back home for a visit. They either told the reporter, or he imagined it, that they were the last trappers in the West, and as such were entitled to respect. The story ended thus: "And then the last trappers of the West moved on toward the New York farm which the old man had left in 1845." This is sad. We have had the "Last of the Buffalo" a good deal. Are we now to have the "Last of the Trappers?"

Destruction of Illinois Birds.

In the report of the A. O. U. committee on protection of North American birds, published in January of this year, Mr. Ruthven Deane, member of the committee for Illinois and a well-known ornithologist of this city, makes mention of the fashion of decorating feminine headwear with plumage. He finds a great many such decorations made of chicken feathers dyed, but learns that egret plumes are much in demand. He does not think our song birds are suffering at the hands of the milliners, and goes on to say:

"Really the only destruction that is now going on among our native birds is evidently among the herons and egrets, and, while this has been on the increase for the present fashion of this spring (1896), the general opinion is that it will die out, not to return to the extent that has heretofore prevailed.

"I have recently been using my influence upon a number of ignorant country boys, who have annually made a great depredation among the herons in what is known as 'Crane Heaven,' on the Kankakee River, in Indiana, and, while my influence was only on a moral basis, several promised to desist from any wanton destruction this year. Two gunners would visit the heronry once or twice during the summer and slaughter from sixty to eighty great blue herons in a day, leaving them where they fell on the ground."

In a later communication Mr. Deane writes as follows:

"Fashion in feather ornamentation has not materially changed since I wrote you in detail in the spring. We occasionally see the heads or wings of some of our native species worn in their natural color, yet the tame pigeon and egret head the list in this section of the country.

"I wrote you before that I had endeavored to use influence in the protection of a certain 'Crane Heaven' on the Kankakee River in Indiana. During two trips in the past two weeks in that region I find, quite to my satisfaction, that no raids were made on the heronry last spring and summer, as had yearly been the custom of the native boys, and, I am sorry to say, some so-called sportsmen. My appeal may have done some good, but the fact that a bad fire played havoc in the woods near the heronry made the approach much more difficult. The location where the night herons bred, a long stretch of low 'pucker brush' bordering the marsh, was wiped out by fire, but the birds evidently found another favorable site, for they are much more abundant now than I have seen them in years."

Mongolian Pheasants.

Mr. H. F. Bosworth, of Milwaukee, is just back from an extended visit in New York and the East, and while in Chicago on his way home called several times at this office, though much to my regret I was out and did not meet him. I should have liked to ask how his big hatchery of Mongolian pheasants is doing this year. Mr. Bosworth, as has been mentioned in these columns, is the largest breeder of these birds in the West, and his interesting experiments have really passed the stage of experiment and reached the point of success long ago. I infer that the birds are doing well, as he still advertises the eggs for sale. Mr. Bosworth deserves much commendation for the plucky way in which he stuck to the work of establishing these birds in Wisconsin, in spite of backsets of a most discouraging nature.

ST. PAUL, Minn , March 2.—Weather at St. Paul moderate, but 2ft. of snow. Work of game wardens on illegal venison handling has been very effective this season. Moose abundant in upper Minnesota now, and when the law is off in 1898 there will still be enough to make sport sure. A local shoe store here shows what I have long ago schemed out, a rubber-soled moccasin, or a trapper's low rubber shoe with buckskin top sewed to it. This combines softness and waterproof quality and should make good snowshoe wear. At Montreal, Can., good snowshoes sell at $2 a pair; in Chicago and St. Paul we pay $5 and $6 for same quality. At Montreal the snowshoe and toboggan fad is falling off so one cannot buy a blanket coat in the whole city. Ten banks failed in St. Paul and Minneapolis in two weeks during the height of the hard times, and the depression is such that few persons are spending money in sport. Every other man in the twin cities wears a fur coat, yet fur dealers had a hard time this winter and one or two heavy firms assigned. Two genuine Indian painted buffalo robes, property of Maj. McLaughlin, Indian trader, are shown in Kennedy Bros.' windows at St. Paul. Ice fishing on Lake Minnetonka is illegal. Large numbers of crappies were sometimes taken in this way. A pike weighing 20lbs. 8oz. was taken by a lady in Minnetonka last fall. This is all the news I have time to know.

E. HOUGH.

1205 BOYCE BUILDING, Chicago.

GOLDEN PLOVER DAYS.

ROCHESTER, N. Y., March 3.—*Editor Forest and Stream:* Your reproduction of Audubon's pictures of birds is not the least of innumerable favors which you have done that part of the public that loves animated nature and field sports. As a member of that body, I wish to testify my gratitude for the rare pleasure which your enterprise has enabled me to enjoy in contemplating the work of the great naturalist.

The bird represented in the last picture published—the American golden plover—has long had a singular interest for me, and as I gaze on the counterfeit presentment which your artist has so admirably reproduced it awakens recollections that extend over many years, and beyond the Atlantic; for I have a distinct remembrance of seeing plover in a bag of game that was shot in Ireland a good many years before I was old enough to sight a gun—and I began young. The County Wexford (Ireland) was, and may be still for aught I know, a favorite place for the golden plover, and I absorbed some mighty interesting stories of sport with the birds on its fertile fields.

I exulted with the sportsman who told me of picking up thirty-six gray plover after getting in both barrels at the "plump" of a flock, and I sympathized with him as he related the incidents of an evening when, carrying a single-barreled duck gun (made by Anglin, of Wexford), he stalked an immense flock of plover on a meadow by means of a punt and a ditch that ran through the field, only to have the cap miss fire when the gun was aimed at 10,000 of the birds.

There was good sport to be had with plover up in this quarter of the State in my day, and although I have not seen a flock of the birds for a long time, the music of their plaintive call has not altogether faded from memory, and I would walk a mile or two—or wheel ten miles—any day to see a flock whirl by in its graceful gyrations. It is not for the purpose of earning the reputation of an "old inhabitant" that I recall the autumn day, so far back that that part of this city now covered with houses was a nursery, when with my "cutty gun"—a single-barrel—I lay in wait toward sundown for an expected flight of plover, and when a fine flock went over me had my gun miss. I used G. D. caps. A man who was beside me got in both barrels at easy range, and as the birds divided at the shot I thought that he had brought down the whole flock. Strangely enough, he did not touch one of them. It has been a mystery to me ever since, for they were nicely bunched as he fired. It was not far from that field that one day, as I was going out in an early snowstorm, a plover got up from beside a roadway ditch and I brought it down with a long shot. It was very fat, and why it had remained here so late was a puzzle to me.

I have heard from men who lived here when Rochester was but little more than a village that plover came every fall in countless numbers, and I can well believe it, for I saw them in pretty fair numbers myself. At a comparatively recent period large numbers of the migrating birds have been heard going over the city, and were either attracted and confused by the lights or were present in thousands, for their whistling could be heard for hours.

Thus it is that your picture of Audubon's plover brings to mind many an incident that long had slept, and many of them are not unpleasant to re-awaken. MUN.

PENNSYLVANIA'S PROPOSED LAWS.

STEVENSVILLE, Pa.—*Editor Forest and Stream:* I desire through the press to express a few thoughts in regard to the proposed Pennsylvania game laws soon to be brought before our legislators, with the hope of eliciting opinions from other sportsmen throughout the State before the bill comes up for final action. Every good question has two sides, and while one side of the game law question has been thoroughly discussed, the other and equally as important side has been totally ignored.

Now while some features of the new law are in the right direction, and as such are to be commended, others are so much at variance with the thoughts and opinions, and so curtail the rights and privileges of our citizens, as to savor strongly of old English laws and class legislation, and as such would not command the respect and obedience of many of our people.

I am neither a market hunter nor a game dealer, and in my humble way have done my full share toward game and fish introduction and protection; but I don't want to enjoy a right nor a privilege under our laws that is not as fully accorded to the poorest and humblest in our Commonwealth. In the interest of common sense and fair play, what difference can it make in game protection whether the legally captured grouse, quail or woodcock is exchanged for tea, coffee or sugar, and by transportation goes on the table at Delmonico's to tickle the palate of a gastronomer; or finds its way through somewhat different channels into the shooting coat of the millionaire sportsman, to be served to his friends as proof of his own prowess? In either case the game supply is lessened to just the amount of the game taken; and whether it is taken by the pot-hunter and the yaller dog, or the well-dressed sportsman and the silken-haired setter, the injury to the game supply is the same.

A bill similar to the one now under consideration was introduced into our Legislature about a year ago, but after passing both branches was vetoed by our worthy Governor (much to his credit), who showed the courage of his convictions in the face of the most powerful organizations and opposition in the State.

That our present game laws need revision I do not deny. Summer woodcock shooting and September squirrel shooting should never have found a place on our statute books. Repeal them and add bounties on all vermin, whether furred or feathered; call for an appropriation sufficient to pay for the introduction and protection of a few new hardy species; let the State appoint suitable game wardens to see that the laws are not violated, and in spite of all legitimate shooting during our present open season game will more than hold its own against its enemy, man. In the "rural districts," where the game is reared and fostered, where the farmer's boy jealously guards the secluded fence corner or the brier-tangled thicket, where the wary grouse secretes her treasures; or the orchard, or the wide-open meadow, where the quail sends forth his cheery greeting to his patient spouse on her well-filled nest; or the rocky hillside interspersed with sumacs and alders, where the stupid cony rears her shivering young, the proposed law would be a dead letter, or if observed at all it would be through fear and not through respect for the law itself. What boy, with the sense of fairness for which every boy (and especially the American boy) is noted, would patiently guard and wait from the early spring, or the long midsummer, till the merry days of brown October, for the game to grow from feeble childhood to vigorous manhood, only to find its way into the game pocket of some well-dressed, well-dogged, well-gunned, wealthy sportsman? The grouse, the quail, the rabbit, means to him (when the season is fairly open) so many dimes for powder and shot, for pens, paper, pencils, stamps, and a hundred little things that are luxuries to the poor, and are of much greater value to him and more highly prized than the game that he cannot afford to eat and is not permitted to exchange, even for the necessaries of life. Would he save and protect for others that which he could not himself enjoy?

Would you, my fine city sportsman and misguided game protectionist? If not, can you ask more from the boy than you expect from the man? Further still, I deny the right of the State to say what disposition I shall make of that of which I am legally possessed, providing such disposition does not conflict, nor interfere, nor in any way infringe on the rights of others.

Make the open season as short as you please, make the penalties for violations of the laws as heavy as you please, but grant to every one under the State laws the same equal rights and privileges that they enjoy under the Constitution. W. W. MCCAIN.

DECOY STORIES.—II.

Editor Forest and Stream:

In a recent issue of FOREST AND STREAM a correspondent gives an interesting account of the pugnacity of an eagle in attempting to carry off a wooden decoy.

Last November our party of five enthusiastic duck shooters were encamped on Lake Nipissing. The weather had been simply detestable. It was rather mild and it rained every day, and a most impenetrable fog hung low down over the water, with not enough wind to move it. The ducks were not moving, and there were many vacant spaces on the sides of our house-boat which we had fondly anticipated to fresco with bunches of mallards and black ducks. When the fog would lift enough we could see a small bunch of bluebills out in the open water. They kept up a tantalizing acquaintance with us, but from constant shooting and disturbance gave all points and suspicious-looking "contraptions" a very wide berth when provoked to flight. This of course brought out various stratagems and devices to circumvent the wily Blue Williams. Two of the party, Harry K. and Will J., with infinite pains and trouble had constructed a good blind right out in the channel, where they smoked and impatiently watched their flock of decoys. That evening around the supper table at the usual experience meeting, and one of the very pleasantest features of our outings, Harry K. told us that, while watching the decoys during the afternoon, he heard a rushing sound, and upon looking up quickly he saw a large hawk descend from the sky with almost incredible swiftness and fasten his claws into a solid cedar decoy and lift it a clear 3 or 4ft. from the water, when he suddenly dropped it and flew away.

The next day and at the same place they noticed three widgeon drop in among their decoys and suddenly disappear under the water, when like a flash the same hawk dashed down and again grabbed a decoy, lifted it clear of the water and dropped it, then seize another, drop it, and make a dash at a third, and again flew away. This particular hawk evidently could count up to three, as he made three determined efforts to secure a meal.

The next day my brother and myself had gone about a mile distant from the locality of the previous day's encounter, and had got snugly hidden in a grass blind, waiting very patiently for a bunch of black ducks that we had raised to return, when we suddenly heard loud cries of alarm and distress above and opposite our decoys. Looking up quickly, we saw a great awkward blue heron coming toward us like the wind, with a large hawk right on top, worrying the agony out of him. We both sprang to our feet, which seemed to add to the poor crane's fright, for he dropped into the tall grass with an awful squawk. His tormentor paused a moment in surprise. My brother, who had been as intensely interested as myself, quickly caught the pirate with a charge of No. 5 chilled shot and ended the marauder's career. A local taxidermist set the bird up in good shape, and as he now looks down on me from his perch over my desk with those vindictive yellow eyes of his, I find myself wondering at the total of his record of game killed during his life. This specimen looks more like a falcon than the ordinary hen hawk, which at first we supposed it was.

Hawks were unusually plentiful last fall, an occurrence which several of your contributors have noticed.

KOSHEE.

GRAVENHURST, Ont.

Elk in Jackson's Hole.

MEMPHIS, Tenn.—I send you a clipping from a Boise City, Idaho, paper of February date in regard to the elk in Jackson's Hole, thinking that such news would do your many readers good, and also showing how important it is to incorporate or include Jackson's Hole in the limits of the Park. I have been out there and know that much of the Park game is killed in Jackson's Hole. The game invariably winters in Jackson's Hole, as this place is more protected from the blizzards and winds than the Park proper.

ALFRED B. WINGFIELD.

The report says: "Thirty thousand elk are wintering in the Jackson's Hole country of Wyoming, according to the estimate of the game warden, who says that in one herd which he saw there were 15,000 of them, stretching over a distance of six miles. The sight, he said, surpassed anything he had ever seen, and utterly amazed him. The elks' trail over the snow was like flint ice, he said, so hard had the snow been packed down. The animals are seen by thousands any morning, moving along the Snake River from the Great Swamp to the Gros Ventres hills, and at night the wails of the calves straying from their mothers may be heard."

"Lancaster's Art of Shooting."

THIS work has been advertised as for sale by the Forest and Stream Publishing Co. The consignment of books sent for us from England was shipped on the steamship Cambria, which was disabled and towed into port in the Azores last Saturday. Until further notice we shall be unable to supply the book.

BROWNIE'S REVENGE.

ONE afternoon in the golden fall,
Dame nature's fête for great or small,
In the land where sportsmen's hearts accord,
Of "sky-tinted water," *l'Etoile du Nord*,
Where woods take holiday attire,
And glorious thoughts thrill youth and sire,
A sportsman, worthy of the name
By gentle magic of his fame,
Was tramping the lowlands up and down;
"Brownie" they called him, all clad in brown.

Now 'mid beacon fires and colors blending
Of sumac, branch and vine, ne'er ending,
Through reeds and rushes of brownish red,
And nut-brown cattails with nodding head,
With dogs in rapid course he keeps in view,
As faithful their circling way pursue;
Watchful and cautious he threads his way,
With eagle eye for winged prey.
And stealthy now, by brambly thatch perchance,
The canines of royal blood advance;
Sharp cracks the nitro, left and right,
As swift from cover bursts in flight
A pair, cut down both quick and neat,
At once retrieved and at his feet;
Now he strokes the brown plumage of scolopax,
Admired by the eyes of retriever Max;
While, nervous and restless, pointer Don
Anxiously awaits the word "Hie on."

Then lies the way by slough and pool,
'Neath bending willows and shadows cool;
Where beauteous landscape doth surround,
On moss-grown log a seat is found,
Where oft his majesty the grouse
In muffled thunder calls his spouse;
A place to puff the fragrant weed,
In quiet, peaceful rest indeed.
Now on by trail through sedge and grass,
Toward wild rice fields and a famous pass;
And here in the open did Brownie spy
A stranger sportsman passing by;
"What luck," cries the stranger, curious no doubt,
For the other's game pockets were bulging out;
And the voice, as it echoed o'er the silent marsh,
To Brownie's ears sounded coarse and harsh;
And giving the fellow a second glance,
He guessed at once what he'd met by chance;
Then *-sotto voce*—"Think I know that jay,
He's none of my kind, but I'll meet him half way.'

For Brownie was a type of sportsman true,
Never talked of himself, as some you hear do;
And to boast of things his, and the score and the kind
Of game he had bagged, never entered his mind;
A natural woodsman and first-class shot,
He hunted for sport, and not for the pot;
In touch with nature's every whim,
And the autumn bird warbling its parting hymn,
When marsh and meadow take somber hue,
And days seem short and far too few;
Never sold a head of game in his life,
Gave the most to his friends and the rest to his wife.
He was rotund and jolly and full of fun,
And carried a sixteen featherweight gun.

In quiet voice he now replied,
Assuming tone quite dignified,
And his conjecture found quite true,
As distance shortened between the two;
For the hunter whom now he stood before
Was of the genus "pot," with a big eight-bore;
And Brownie, though not of a critical kind,
Sometimes abruptly spoke out his mind;
Although with the other not inclined to discuss,
He referred to the eight as a big blunderbuss,
And made other remarks that might have lent
Further material for argument;
For he had no use for one who would stoop
To kill all he could at "one fell swoop."

Now the stranger was not in a pleasant mood;
Neither in tune or accord with the solitude
Of marsh and meadow, and the fragrant scents,
Or the turtle dove cooing on yonder fence;
Neither light nor beauty, joy nor song,
Had charmed the way as he passed along.
To kill for meat was his heart's desire,
And nothing else could his soul inspire;
And the first thing this fellow proceeded to do
Was to tell of the bags he had made, not a few,
And the kills he had made with his wonderful gun:
'Twas the greastest "shootin' iron" under the sun.

Just then up the marsh there appeared in sight
A lone pair of teal coming in for the night;
Swift they come, down wind with bullet-like speed,
Heading on for a favorite place to feed;
Bang! bang! roared the eight as the pair whistled by;
Crack! crack! the sixteen. Brownie neat "wiped his eye,"
And as Brownie's dog Max went the blue wings to retrieve
He said to the other: "One would scarcely believe
That a little sixteen's up to that kind of biz."
Then he turned and strode off, with a grin on his phiz.

WAPAHASA.

Quail Shooting at Karnak.

KARNAK, Egypt, Feb. 1.—Day before yesterday with my *guide de la chasse* and a number of boys I went after quail, which are just begining to appear.

I flushed fifteen single birds, bagged six and shot down thirteen. Compared with our birds, they are easy. They flip up like rails from the corn grass. I hunted in half-grown wheat.

In a couple of weeks they will be very plenty in the lentil fields, and it is said that a fair shot can bag a hundred birds.

The way in which these birds fly would make an American quail blush to the roots of its feathers. RAMON.

Georgia Quail and Turkeys.

THOMASVILLE, Ga.—The Mitchell House here has a preserve of 10,000 acres especially set apart for the use of its guests, and nearly every day some of the guests bring in good bunches of quail. One shooter bagged five turkeys at a shot last week. SAYVILLE.

Ignorance of the Law.

Editor Forest and Stream:

While in the eyes of the law "ignorance of the law excuses no man," still I am positive that there are many violators of the game laws who would be rigid observers of the same were they not ignorant of them. The other day two young fellows from the city passed my house, and each carried a shotgun. Out of both side pockets of the coat of one of the young fellows hung the tails of a number of gray squirrels. The law on squirrels went into effect on Jan. 1, yet these young men made no secret of the success of their day's shooting. Stopped and questioned as to the locality where they had shot the squirrels, they proudly said that they had shot them in Warner's woods, a famous place for squirrels. When asked if they did not know they had broken the law and were liable to arrest, they answered that they supposed there was no law on squirrels. That the two young fellows who had the squirrels were honest and respectable could be instantly seen by glancing into their faces. I know a young man who saw two Italians passing through the village of Westville last November. One was a jolly, good-natured son of Italy, yet was showing openly a handkerchief half filled with small trout which he had netted in the Gaylor brook. Now, that Italian was unconscious that he had broken the law, otherwise he would never have laid himself liable to arrest by displaying the trout to every person he met.

Why would it not be a good thing if bills were passed by the legislatures authorizing their fish and game commissioners to see to it that every road leading out of the cities into the country be posted at regular intervals with framed copies of the fish and game laws?

As our country contains so many people who speak other than the English language, each notice should be printed in two or three different languages, so that the foreigners as well as the natives could be enlightened.

Besides the laws, each notice should contain a brief lecture telling why the fish and game should be protected, and pointing out the benefits to be gained by the people at large through such protection. Such an argument would open the eyes of many who never stop to think that it is possible for the game to entirely disappear should there be no restriction whatever placed on the killing of game and fish.

WILLIAM H. AVIS.

CONNECTICUT, Feb. 24.

His View of It.

Editor Forest and Stream:

I noticed an article or two in a FOREST AND STREAM I picked up headed something like this, "Who Owns the Game the Guide Kills?" "To Whom Does it Belong?" I read one of the articles, in which the writer says the guide claimed all the game he (the guide) killed. He could not have been much of a guide or he would have claimed all the game, the guns, dogs and camp outfit while he was about it. Any self-respecting guide ought to have everything. I am surprised that that guide did not take the gentleman's watch and clothing and hold him up for his bank account. I don't think that guide understands his business. A guide has no object in taking a gentleman on a hunt except to make all he can out of it. He may agree to go for $1.50 a day, or say $3 a day at the most—the money is no object. The guide's object is to get the man out and hold him up for all he is worth.

There are guides, though, who don't do business that way. They charge for their services a fair price, and not only expect to do, but do everything possible to make a gentleman's trip a success in every way. They never think of claiming anything they kill. They suppose that if they sell their time and services to a gentleman, anything they do, anything they kill (if the employer wants them to shoot at all), belongs to the party who hires them. They know or suppose they are out for his pleasure, not their own; that he hires them to show him the game he wants, not only the game, but anything of interest, from a flower or insect to a mountain or glacier. Such a guide's business is to please his patrons; he treats them as gentlemen and expects to be treated likewise. His efforts, time and best endeavor given, for the time he is paid for, to make the trip satisfactory in every way. If by chance it is not, he feels disappointed, usually more so than the person who hires him. He would not think of claiming any game he killed. In fact, come to think about it, I never heard of such a thing or read of it before I saw it in your paper. Is the gentleman who complained sure he had a guide with him?

G.

Yellowstone Park Game.

A CORRESPONDENT, writing under date of Feb. 24, from Gardiner, Mont., on the edge of the Yellowstone Park, reports: There have been several hundred elk just across the Yellowstone River from town, also about a thousand on Crevasse. Several were killed, but the State game warden came up and made an arrest, which put a stop to the hunting, and the elk are not molested any more. McCartney's field, which is just opposite Gardiner in the Park limits, has from seventy-five to one hundred antelope in it every day, and one could almost at any time stand in Sargent's store and shoot one. They are very tame. The sheep are in the cañon again this year, and elk are scattered all around. I hear that there are more elk in Jackson's Hole this winter than usual.

California Notes.

MURPHY, Calaveras County, Cal., Feb. 20.—I got a letter the other day from a friend who lives in the southern part of this State. In it he says: "We have just had a little rabbit drive out my way. About fifty guns were out and we got 500 of the long-eared pests." Pretty good.

Our quail season has just closed. Although this country has been very closely shot over during the last few years there is yet some good shooting to be had. We have two kinds of quail here—mountain and valley. The mountain quail live in the higher mountains most of the year and only come down here in winter. Our altitude is only 2,000ft. The valley quail are more numerous here during the autumn months than at any other time during the year. Five dozen to two guns is our best day's record.

There are a few ruffed grouse in the mountains north of here. But few are killed, however, as they are wary birds and know just where to hide in the thick timber. Some of this timber is over 300ft. in height.

Very few deer have been killed around here this winter. There has been but little snow in the mountains and as a result the deer were not forced to come down to feed. A favorite way of hunting with our sportsmen is to wait until the hills are covered deep with snow and then go for deer in the deep sheltered valleys where there is seldom much snow. A party of three in this way got twelve deer in a two days' hunt last winter.

The wild pigeons which were once so plentiful in this country are now almost extinct Ten years ago a good shot could bag a hundred in a day, while now you are lucky to see a dozen in a season.

We have some very good dove shooting here in the autumn months. Now our game is limited to jack rabbits and gray squirrels, and some good sport we have with them too. Two years ago over 1,000 gray squirrels were killed around this town.

WALROD.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

MEN I HAVE FISHED WITH.

XXXV.—Pete.

IT took Pete a long time to learn that small, "no account" fish were as desirable as those which were large enough to eat, but what they were put into kegs of alcohol for he never did understand. The postmaster at Tangipahoa had recommended him as a darky boy who knew all the fishing places in the vicinity, and I engaged him to help Charles Bell and myself collect the fishes of that part of Louisiana whose waters flow into Lake Ponchartrain. He was a strong boy, quite dark, and was active when he wished to be, and he enjoyed the work.

This was in June, 1875. Prof. Spencer F. Baird was then the United States Fish Commissioner as well as the head of the Smithsonian Institution, and in his order he said: "After you deliver the shad fry in the river at such place as you may select, I want you to collect the fishes of the rivers and pools, keeping an eye out for trout."

"Trout in southern Louisiana, Professor?"

"Yes. So many letters have been received from citizens claiming trout are native there, and asking for more, that, while we have doubts on the subject, we can't deny their statements; and I want you to see if you can find a fish there which you will call a trout, and if so preserve it with great care." Then with a variety of fishing tackle fit for trout, bass or pike, Bell and I started on what not only promised to be, but was a most delightful trip.

Coming down on the railway, before we reached Tickfaw, the fact that we had live fish in the baggage car was known throughout the train, and visitors came to look. In conversation with a gentleman on the subject of trout, he said: "Trout are plenty in all these streams, sir, yet from what you say you seem to doubt it. I was raised in the North and have caught trout in Vermont, Canada and New York, and I know a trout when I see it." That should have been conclusive, but the sluggish streams filled with pond lilies did not look trouty. I've taken trout in waters where pond lilies grew, but always in the colder parts of the pond; and here we were in Louisiana. "Yes-sah," said Pete, "datta's a trout, sho 'nuff," as I landed a black bass of the big-mouth persuasion, and the old settler who was "raised" in the North declared it to be the same kind of a fish that he had taken in boyhood in the streams of Vermont. On returning to Washington I reported to Prof. Baird that I had fished diligently and had taken many fish which I called black bass, but which all the people about Tangipahoa called trout, and furthermore I had not seen a fish which I would call a trout. The Professor merely said, "I thought it would turn out so."

On this trip we did not see a small-mouth black bass, and the largest big-mouth we took weighed 8lbs. on the grocer's scales. Here let me get away from the story to ask why, in writing of the two black basses, we all agree to say "small mouth," while some of us use "big mouth" and others "large mouth" for the other fellow? There are always two sides to a subject, and a white native said to me: "I don't see what right you've got to come an' tell me that our trout are bass. They've always been 'trout' here, an' we've got as good a right to name 'em as yo' have." That was a clincher.

Tangipahoa could not only give us better accommodations in the matter of food and lodgings, but was nearer the Tangipahoa and Natalbany rivers than any other, and was therefore the place to make headquarters, and we captured Pete. The little village had perhaps 300 inhabitants, of assorted complexions, and we were genuine curiosities to them. There was no newspaper there; but the grapevine telegraph, which runs over the back fences in all country settlements, soon informed the people that two Northern men were there on all kinds of missions.

Pete may have been sixteen years old, but he felt several inches above his normal height when he started on our first trip with a bodyguard of half a dozen boys of all the shades between ebony and light molasses cakes. Pete in front with the air of a drum major, the boys behind carrying nets and pails, while Bell and I tried to live up to the dignity of traveling with an escort.

As we walked down the railway track Bell remarked: "We have done well in getting Pete. He may not do much, but he has a host of volunteers for us, and the Government gets the whole gang for Pete's half dollar a day. I don't know, though, but we could have got Pete for a quarter a day, and perhaps he would serve, like the volunteers, for the honor, if he was only put at the head of them."

"What you say is probably true, Charles, but we must not grind the faces of the poor, and the people of America would not bless us if we saved them that little sum. Again, if Pete served us without pay we would have as little control over him as he would have over his assistants."

"That's so; but I was only moralizing over the love of authority that many men have and which is exemplified in this negro boy. Yesterday he was only a common boy like the rest; you have given him position, and see how he has assumed an importance among his fellows and how they look up to him. You must admit that it is a true reflection of human nature, drawn in charcoal."

We had passed several pools beside the railway where excavations had been made to throw up the roadbed in this very flat country, and I should no more have thought of looking for fish in them than in the temporary ones in more hilly lands, but a little thought showed me that these pools were permanent. A swirl in one of them caused me to ask a question.

"Yes, suh," replied Pete, "dese pon's is full o' fish, but dey's no 'count, on'y little ones. W'en we comes to de ribbah we gets big ones."

Ordering a halt, the boys unloaded the small 15ft. Baird net and started in to drag the pool, which was not over 75×100ft. The result was a surprise. The long bag brought out a mass of fish life, and Bell made a rough assortment of it into the buckets and I went over them again. The supply of alcohol would not warrant keeping many specimens, and we were the sole judges, if not of the first class, of what was worth preserving.

It was practically midsummer in Louisiana, and the vegetation was rank, and I ask you to believe that the air was several degrees above what could be found in Alaska on the same day. Every darky boy was barefooted and bare-legged. We had seen many snakes slide into the pools by the railway, but had paid little attention to them. The fact that these darky boys waded in where the serpents went was to us proof that the snakes were harmless. In one haul we brought out a snake and I promptly held it under my foot preparatory to examining it, for I was on intimate terms with the dirty water snake of the North, having reached for him in a hole under a bank in my trout ponds, bringing it forth alive, striking me with its harmless teeth before I could twist its head off with the other hand. So you all see I was very well acquainted with the ill-tempered *Tropidonotus sipedon*, which lives on fish and frogs, and I thought this animal might be the same.

Pete called out: "Take cah, dah! Datta's a wawtah moccasin, an' he kill yo' if he bites yo'." And he was right. It was a very deadly relative of the Northern copperhead and scientists know it as *Agkistrodon piscivorus*, and yet those darky boys went into pools bare-footed where they knew this dangerous serpent lay, even after seeing it glide into the pool. This was a puzzle, especially as they were horrified to see me handle the snake after it was dead. I opened its mouth with a pocket knife, saw the poison fangs and pressed out the poison to make sure that it was a venomous reptile. The dark, vertical bars, in place of alternate blotches, proved that it differed from my Northern acquaintance.

Pete said: "Da moccasin he's good 'nuf w'en yo' don' 'sturb him. He git outah way ef he gotta chance, but w'en yo' put yo' foot awn him he bites, an' he p'ison sho 'nuff; he kill a da'ky boy las' year down 'bout Tickfaw, an' long time back one bit ole Massa Kya'ta (Carter) down by de big swamp, an' he put a hot nail in de hole an' drink a pow'ful heap o' w'isky, an' he doan die, but he leg got small an' he been ailin' since; can't eat no fat po'k, no possum, only cawn pone an' 'tatahs. How yo' gwine take bread in yo' han' w'en yo' had datta snake dah?"

"That's all right, Pete, I'll wash my hands before I eat; but if you are so afraid of this water moccasin, how is it that you boys go into these pools barefooted when you have seen snakes go in first?"

"It's dis yeh way: W'en you go slow de moccasin he git out yo' way. On de lan' he see yo', an' in de wawtah he heah yo', so w'en we go in de wawtah we go slow an' splash an' make noise, an' he go 'way."

Here was an interesting bit of snake lore from an unexpected source. An ignorant darky boy taught me something, and was so sure of his knowledge that he seemed to risk his life on it. I say seemed to risk his life, because from his point of view there was no risk so long as he exercised a proper care. He was a scientist in his way. He was afraid to touch a dead snake, but just what reward would tempt me to wade about barefooted in a pool where I knew deadly serpents were hiding I have never figured out. During our stay I watched the boys and found they had a system. If our larger 30ft. seine would sweep one of these holes beside the railway, it was done with boys on each bank; but if the pool was larger, they took it in sections, going slowly and making a great splashing. If we hauled out some snakes, they cared little about killing them; Northern white boys would have killed them all, but these boys seemed to live on peaceful terms with this very common reptile, which is also called the "cotton-mouth," from some reason unknown to me. Perhaps Pete expressed the feeling of indifference to killing them when he said: "W'at's de use killin' a few snakes w'en dey's so many in all de holes an' in de swamps?"

Bell and I complained to the landlord that our beds were not made. The first time we thought it a mistake, but when it occurred again we protested. He called a chambermaid and wanted to know. She looked indignant and replied: "'Deed I isn't gwine in datta room 'mong all dem snakes dey's got in dem glass bottles, to make any beds. Ise pow'ful sot ag'in snakes, I is, an' I dunno wot men's gwine 'roun' gettin' em fo'. Ef a man wants snakes in his room he can make hees own bed; I doan gwin dah. Um-m!"

And so it came to pass that Pete was duly installed as our chambermaid. He had no fear of pickled snakes, dead and well sealed up; and from the disfavor with which we were looked upon by the colored girls we thought it possible that Pete's services might be required to wait on us at table. Our mission was a mystery that no explanation could solve. We were under more suspicion than when, as pirates, we had cruised long Island Sound with the "Jolly Roger" at the fore. But then we proclaimed our mission and were understood; now we were suspected of having some occult purposes, the exact nature of which these colored people had no clear idea. There were glances and whisperings. At last Pete let it out.

"Dey sez 'at yo' Yankees comes yeah to get snakes an' fish to take up No'th to make all de cullod people slaves ag'in. Is dat so?"

The question was an honest one, and demanded an honest answer; but what could we say?

"Who says so, Pete?" I asked.

"All de gy'ls at de hotel who wouldn' make yo' beds, an' all de cullod people dey want to know wheffo you ketch snakes an' put 'em in bottles, an' dey tell me not to wuk fo' yo', cause you's bad."

"Anything more, Pete?"

"Yessah, dah's Massa Almy, a w'ite man up by de station, who says yo' is doin' bad t'ings an' ought to be stopped."

"Charley," said I, "this boy tells us a story which, read between the lines, means that we are looked upon as suspicious characters. He is honest and square with us be-

cause we pay him, but there is more back of it than he tells or knows. If we are ordered to leave the country for the country's good, we can easily and gracefully retire with all the honors; but, my boy, if it comes to a lynching party I should hate to die in so poor a cause. What d'ye think?"

Bell looked amused, and replied: "This thing is very funny. As for the talk of the hotel servants, that's nothing; I don't like colored servants anyway, and the further they keep away the better I like 'em. Let's go up and see this duffer, Almy, and talk to him, and find out what he's got to say; we may knock a lot of fun out of him if we work it right. I know the old excrescence very well, for I have talked astronomy to him, and when I told him that the moon was shaped like a clam shell and sometimes had only an edge toward us he said he knew that."

We sat on the steps of the railway station and talked with Almy. Suddenly he said: "I s'pose you don't believe in voodoos; most white men don't, but I've been studying voodooism, and I know they have a hidden power."

His remark being partly in form of a question and directed at me, I answered very truly that I had never paid any attention to it. With a look at me, Bell innocently asked: "How is the power developed, by gas, coal, electricity or solar heat?"

Ignoring the question of the young man, he said: "There's an old colored woman who lives close by here who has great power. After you go to bed, if she should mark a cross in front of your doorstep and you were the first to step over it, she would have power over you all your life. She could strike you blind, or dead, even if you were 1,000 miles away."

"Datta's so," said Pete, "de cullod people 'bout yeah's pow'ful shy o' her, an' w'en de kyars run offen de track—"

"Shut up, Pete," said Bell, "you'll find some o' them pickled snakes in your bed if you talk too much."

"This is a new and interesting subject to me, Mr. Almy," said I, "and I would like to investigate it. Suppose we try it! Let her make the cross before our door to-night, and I'll make Mr. Bell step over it the first one in the morning."

"All right," said Bell, "it's a go. Here's a $5 bill for the old gal in the interest of scientific investigation; no doubt the amount can be put in the expense bill and the result of the experiment be reported to the Government, after which we will receive the thanks of Congress for being pioneers in a new field of observation."

Pet sat with open eyes and mouth, gazing at the man who was willing to sacrifice himself for something beyond his power of understanding. Mr. Almy gazed awhile at a fence lizard which was taking a sunbath on the hitching post, and then, in a tone deeply tinged with regret, said: "I wouldn't let you do it for all the world! I s'posed you didn't believe in the voodoos, none of the white folks 'bout yere do, leastwise they say they don't, but I know better." Bell was disposed to knock a little fun out of this man by asking ridiculous questions, such as: "Could she make a marble statue change from a Roman nose to an ingrowing face?" but I looked at him in a manner that stopped his fun, and explained our mission to Mr. Almy, and he understood why we wanted fish and snakes.

After we left our new friend Bell broke out with: "Well, what's got you? It's the first time I ever knew you to refrain from working a mental curiosity for all there was in him. Perhaps I alarmed him, and there's more fun to be got out of him by your own plan. What are you reserving him for?"

"Charley," I answered, "there are a few other things to be got out of our friend besides fun. Professor Baird did not send us here merely to have fun; incidentally we may have a little, but primarily we must collect fishes for more learned men to study, and this man, Pete says, is the best man to shoot big fish with a bow and arrow that there is in this parish, and I want to see the work and get a look at the fish, thus combining duty and pleasure while we are learning something. But if we go at him to 'knock fun out of him,' as you incline to do, we make him our enemy at once. The man is intelligent on all other subjects than voodooism, just as you may know more than he gives you credit for. I tell you, my boy, one man is not a fair judge of another. He thinks he is, but he measures him by his own mental tape, on which the inches are very long. Every man sums up his fellows, but he has only his own measure by which to gauge them. As you suggest, we can get some fun out of his queer notions, but by ignoring these he will be valuable in other ways. Every man thinks he has the proper mental balance. He has no other to judge by. He thinks that many things in this world were unevenly divided, but knows that he got his share of brains. Let the man alone; he is seriously inclined, and what you may think funny when you are playing for my applause will not only exasperate him, but will make him an enemy. No one appreciates the unconscious humor of his theories on witchcraft more than I, but permit me to call your attention to the fact that the man who has the keenest appreciation of humor seldom laughs."

"That's true! There was 'Fat Jack' Evans, of Albany, who would laugh until apoplexy threatened, and when he got through couldn't tell the nub of the joke. But it is true that when you want to get a lot of fun out of some fellow who is really funny and doesn't know it, you mustn't laugh, or you'll queer the whole show."

Pete tracked a turtle and found its nest containing twenty-seven eggs. These we took to eat because he said they were good, but we did not care for them. We had seen soft-shelled turtles and a fine hard-shelled species over a foot in length, but we did not catch any. The people there spoke highly of the flesh of the latter, but were disgusted to know that we ate frogs. Pete was our mentor, and from him we got the local names of the fishes. My note book shows that the fresh-water drum of the Great Lakes is a "gaspergou." "Warmouth" is applied to several species related to the rock bass of the North, while the names red eye, goggle eye, etc., were applied to the same fishes, and the darky boys disputed over the names with the ardor of scientists. "Brim" and "blue brim" were no doubt corruptions of the English bream, and were large fishes of the sunfish type, growing up to 2lbs. weight, and there were many new fishes.

I had arranged with Mr. Almy to go down the river with him in a dugout and shoot fish with an arrow, leaving Bell to fish with Pete. That, however, is another story. When we finally left Tangipahoa and bade goodby to the few friends we had, Pete took from his head a thing which he was pleased to consider a hat and said: "Ise pow'ful sorry you is gwine away, an' if yo' come back nex' yeah I want tu wuk fo' yo'. I doan mine wot dem wimmen at de hotel say. Dey say you is voodoo Yankees 'cause you is got snakes in bottles, but Miss'r Almy he say yo' ain't hu't nobody, an' he know all 'bout the voodoo."

The engine whistled "off brakes," and Bell and I swung on board, waving farewells to Mr. Almy and Pete, with his bodyguard of darky boys; true and good friends, who stood and watched the train until it vanished in the distance. To those who value friendship merely in a commercial way Pete and Almy would be forgotten at the first curve of the railway. Often they come up in a backward glance and their memories are sometimes with me when musing on the pleasures of the past.

FRED MATHER.

ANGLING NOTES.

Undersized Trout.

MR. ALBERT C. CLIFTON, of Hague, on Lake George, N. Y., writes me the following letter under date of Feb. 18:

"I wish to call your attention to a practice now common on our lake of catching little lake trout of ¼lb. or ½lb. in weight. When they are of that size they have a habit of collecting in certain favorable spots in great numbers, and are caught with fine tackle by still fishing. The most noted place near us for this kind of fishing is at Anthony's Nose, where thousands were taken last season, not one in ten of which would weigh ½lb. As many as sixty a day were taken there last summer by one boat, and it is not unusual to see four and six boats on the spot at once. The only remedy I can suggest would be to make the limit at which lake trout can be killed and possessed nothing under 2lbs. in weight, with a penalty severe enough to deter the pot-fishers from catching the little fingerlings that they never contribute a cent toward placing in the lake. No sportsman would be seen with such fish in his possession, and no hotel at our end of the lake will buy them."

The first water in this State to be closed to trout fishing through the ice was Lake George. In the old days it was customary to fish through the ice for trout in season and out, for it was always the case that there was ice in the lake after the legal season opened, and it has been one long fight to prevent poachers from fishing for trout during the close season.

When the State began to restock the lake with lake trout the lake was nearly depleted of this fish, but after a few years' stocking the fishermen apparently set to work to exterminate the planted fish. The season opened April 1, and there was ice in the lake (for only once within the memory of man has the ice left the lake anywhere near April 1, as it does not generally go out until toward the last of this month), and the fish caught through the ice were little trout such as Mr. Clifton refers to. The markets were overstocked with these little trout, and an effort was made to stop it by prolonging the close season until May 1, as at present. It was the exception to get a big trout through the ice, and it was also the exception to get a small trout after the ice was gone. To be sure, after the ice was gone the fishing was mostly trolling, and through the ice it was necessarily still-fishing. Trolling was so successful that the old style of buoy fishing in spring and summer was practically abandoned. Within a few years I have known of cottagers who again resorted to buoy fishing, and from their own statements they rarely get a big trout at a baited buoy, fish from 1 to 2lbs. being the rule.

Brook trout cannot be killed legally under 6in. in length, and the same limit law applies to lake trout; but what may save the brook trout until some may spawn will not, when applied to lake trout, have any effect upon saving them. A young lake trout in the spring is long and slim, and if the limit of length at which they could be killed was fixed at 12in. it would place them in about the same class with the brook trout at 6in. It is difficult to fix the limit of fish to be legally killed by weight, and a length limit would be far better.

As Mr. Clifton says, no sportsman would be seen with one of these little trout in his possession; but in every community there are a few, or many, men who will, unless restrained by law, rigidly enforced, catch everything of fish kind that comes to their hooks and kill it. They have no thought or care about the future fishing in the water they despoil, they simply take everything in sight. The killing of fingerling fish does incalculable harm, and restocking in some waters will not replace the waste from this cause. Men who should know better have been known to bewail that there is a 6in. limit law for brook trout, because they like the baby trout to eat, fried brown, soon after they have absorbed the umbilical sac. Potatoes cut to the same size and fried brown in hot lard would be far better in every way.

For two years past there have been complaints that lake trout fishing in Lake George is poor, in spite of the fact that 500,000 trout fry have been planted annually for many years. It is not true that trout are not in the lake, for there are plenty of them to be seen even if they are not caught, but catching baby trout will not help the fishing. People complain about the fishing in a lake or stream and clamor to have it stocked, and as soon as the water is planted by the State there seems to be a competition as to who shall catch the greatest number of fish. A small lake in New York has been overfished without doubt, as it contains large black bass and people came from far and near to catch them. It was urged that the State should make a planting of black bass in this lake, and last year 100 adult black bass were obtained and sent to the lake by the Fisheries, Game and Forest Commission. A man who has been active in having fish planted in the lake owns a hotel on its shores, and a week or two after the State had sent the 100 adult bass to restock it I saw in a newspaper that the professional fisherman employed at the hotel had caught sixty black bass in one day. Perhaps that lake will get another lot of bass from the State this year and perhaps not.

Everything that is not popular in these days is called old-fashioned, and I am old-fashioned enough that I would not attempt to stock any water with fish unless there is a sentiment in the community where the water is located favorable to the perpetuation of the fish. If people wish to catch black bass on the spawning beds and howl to the State for more, they would not get the bass if I were the State. If they caught the fingerling trout as soon as they are big enough to bite a hook, they would not get any more trout. There are waters enough in the State that need stocking or restocking where the sentiment favors just and adequate protection to the fish to keep up the supply, and let the spawning bed robbers and fingerling butchers think it over on the stool of repentance.

Last year I happened to be on the State fish car when it was loaded with yearling brook trout, some of them 8in. long. As they were being unloaded, a man looked into one of the cans and asked where they were to be planted, for he would like to go and catch some of them when the season opened a few days later; and from his manner I had no doubt he would do that very thing, had he found out where the fish were to be planted; and yet before he finished talking he condemned the commission that was planting the fish for not making the fishing better in that locality.

Trout, Black Bass and Pickerel.

Here is another letter received from a gentleman in Scranton, Pa:

"I notice in one of your FOREST AND STREAM notes something about black bass in trout waters. When I called on you some two years ago or so we were speaking of this in connection with a lake near here. This is a lake of 380 acres, 50 to 66ft. deep, spring fed, and unusually clear and cold. It was originally a trout lake. Some seventy years ago or so it was stocked with pickerel. Of course the trout disappeared. Then about 1870 it was stocked with black bass (small-mouth). Landlocked salmon and other species of fish were planted, but never seemed to come to anything. The black bass got the upper hand of the pickerel and pretty much run them out. Our Association, on my suggestion, started in to stock with shrimp, smelt and different kinds of food, and followed it up with different species of trout, principally lake trout about 4in. long, of which we put in some 3,000.

"This present winter a number of lake trout 4lbs. in weight have been taken through the ice. We have not yet proved much, but as far as it goes this would indicate that lake trout can take care of themselves as against pickerel and black bass."

The chief interest to me in this letter is the persistency displayed on the part of the writer and his friends to stock the lake in the face of adverse circumstances with the choicest fish, and apparently the lake trout were established only after the lake had been planted with fish food. Another point is that the lake trout were established by planting fingerling fish. It is not unusual to find lake trout, black bass and pickerel (*Lucius lucius*) in the same water, living without one interfering with the others. Lake George, already mentioned in this column, has always had pike, the so-called pickerel, lake trout and black bass, and never, so far as diligent inquiry can discover, has a trout been found inside of the black bass or pike except in one instance. In Upper Saranac Lake a lake trout was caught with a number of pike inside of it. In Sunapee Lake, New Hampshire, there may be found common speckled trout, landlocked salmon, Sunapee saibling or golden trout, black bass, pike and pike-perch. The speckled trout are not as abundant as the golden trout or the landlocked salmon, but all the fish named are found in the lake. It is the speckled trout and the black bass or pike that fall afoul of one another as a rule, for all three may be considered shallow-water fish in contradistinction to the lake trout, landlocked salmon and golden trout, which may be termed deep-water fish. More and more I am inclined to think that brown and rainbow trout may be made to thrive in waters containing pike (provided food and temperature conditions are suitable) if the pike are netted at spawning time in the spring, and the trout planted are yearlings or older fish.

I have frequently referred to Loch Leven, in Scotland, which contains pike and the Loch Leven trout, and yet by netting pike the trout have increased in size and numbers, for carefully prepared statistics concerning the fish of the lake are published annually. That food for fish is one of the most important factors in establishing any species of fish there is no reason to doubt, and perhaps further experiments will demonstrate that we have held erroneous ideas regarding the habits of some of our fishes, because the conditions have not been what they should be or what they could be made to insure other habits.

Planting Lake Trout Fry.

The Fisheries, Game and Forest Commission of New York issued a circular giving instructions how to transport and plant young fish. In it occurs this passage: "Lake trout should be planted among boulders or rocks on a shoal in *mid-lake*, very near to deep water, into which the young trout soon find their way." The circular further says the trout may be planted on spawning bed shoals if other shoals are not to be found and the spawning beds are known. The reason for this distinction has been explained that eels and other fish resort to the spawning beds and the fry may be safer on shoals not used as spawning beds.

Recently I was talking with a professional fisherman, and he said the directions in the circular were correct, but they were not always carried out by those who planted lake trout fry, and he cited a planting of lake trout fry made last year on the shore of a lake. The fry were planted among the boulders near deep water, but on shore instead of in mid-lake. He said he caught perch on the shore in June that were filled with little trout, and this would not have been the case had the trout been planted as directed, for the perch spawn on the shores in May and do not resort to the mid-lake shoals until July, by which time the young trout would have found their way into deep water, and so they would not meet the perch.

The reason for planting the trout on the shore was that one of the men who planted the fish wished to make sure that the trout would be established near a cottage he owned on the shore. The man ought to have known better, as he has lived on the lake all his life, and has known of trout being planted since 1876, and they have always been found on the same grounds, no matter in which part of the lake they have been planted.

"Forest and Stream's" Big-Fish Record.

FOREST AND STREAM'S record of big fish is now in its infancy, but I expect before a year rolls around that additions and corrections of the record will bring out some big fish that have perhaps been lying dormant for lack of just such a record as FOREST AND STREAM has now provided to bring them before the public.

I have a letter from a gentleman in New York city, from which I quote: "Referring to your contribution to FOREST AND STREAM'S record of big fish, I would call your attention to the following facts, and perhaps by looking further into the matter you may get some information that will be of interest to you. Some time during May or June of last year a young man came into the office to order some goods, and showed me a very large mounted brook trout, which he was taking to somebody in Walton, N. Y. I asked him what it weighed and where it was caught, and he said it weighed over 10lbs., and was caught in the Delaware River near Walton. I have forgotten the name of the person for

whom the mounted fish was intended, but I believe he is a hotel keeper in Walton. In September, while at East Windham, N. Y., I was talking to some acquaintances about fishing and shooting, and mentioned having seen the large trout. Mr. Jerome Campbell told me he had been in Walton shortly before, and had seen the mounted specimen; and he also told me that a larger one, weighing, I think, over 12lbs., had been caught afterward by a carpenter who, having dug up some worms while digging post holes, thought he would try his luck fishing before going home. He tied a hook to his plumb line, and baiting with a couple of worms caught the big trout. This latter fish, I believe, was not mounted. Mr. Campbell told me that everybody in Walton was talking about the two big trout, and therefore you will probably be able to locate the persons interested and get a reliable statement and the exact weight of the two fish referred to."

The names of people were given in the letter for me to write to, but as I am going to Walton very soon I prefer to wait and investigate personally on the spot. Having heard that some salmon of about the weight given had been caught in the upper Delaware, I wrote to my correspondent asking if the mounted fish were not a salmon. He replied:

"The mounted fish to which I referred in my previous letter was certainly not a salmon, as it showed all the characteristic markings and spots of the brook trout, which had been touched up by the taxidermist. The fish was very broad and deep for its length, and the young man who had it said it was very fat when caught. When you go to Walton you will be able to locate the fish and get positive information in regard to its weight, also in regard to the heavier trout, which I was informed was also caught there."

Twelve pounds is rather large for a brook trout in New York waters, but the FOREST AND STREAM record has put me on the track of a larger one. I am not ready to spring all the facts on an unsuspecting public yet, for I am going to the lake where this bigger one came from when the season opens. At present it is sufficient to say that the lake is in the Adirondacks, or rather pond, for it is not large enough to be called a lake. I have known of some large trout being taken from it, and they were called brown trout. It is a planted pond, and all the trout so far caught have been large. The gentleman who planted it supposed he planted brown trout, as that is what he applied for. I went to it one year just after the ice was out, but caught nothing. Lately I heard of the "whopper" from the same pond. After my visit to the pond I was inclined to question the species of the fish, because of a photograph of a catch which showed marks which indicated that the fish might be brook trout; and a friend sent me a specimen, weighing about 3½lbs. dressed, which he said was like the other fish in the pond. The fish I received was a brook trout (*fontinalis*), and not a brown trout at all. Later I found that my friend had not seen the fish before it was sent to me. It was delivered at his house, and the man who caught it said it came from the pond, so he telephoned from his office to have it packed and sent to me. From this it will be seen that there is doubt about the species of trout in the pond; possibly the one can of fry planted may have contained both brook and brown trout, but that question my friend and I propose to settle the coming spring. One thing, however, is certain: a trout came from there which weighed 13lbs. 3oz., and the man who caught it and his wife will both swear to the weight. Another one weighed 11lbs. 7oz., and another one 7lbs. 4oz.

Naturally I am inclined to believe that the larger fish are brown trout, but nothing will determine that positively until an investigation is made to find what the pond contains. The man who caught the fish of 13lbs. 3oz. says that in the fall of 1896 he saw eleven trout in the stream in one pool, and that he thinks one of them would weigh over 20lbs. That fish is there yet, and it is the one my friend and I are going there to cultivate if possible. Personally I will be satisfied with one of 7lbs., but I wish my friend to add the biggest one to the FOREST AND STREAM record as his catch; or, better still, have his wife add it as her catch, and I hope it may weigh over 20lbs. A. N. CHENEY.

FISHERMAN'S LUCK.

UNCLE WILLIAM, one of old Virginia's big-hearted, jolly-dispositioned gentlemen of the old school, was out walking one Sunday afternoon in early June. For companions he had two younger men, who, like himself, were disciples of Izaak Walton. The day was perfect; soft breezes from the south gently swayed the newly-leaved boughs of grove and hedge, the emerald green of the pasture was liberally sprinkled with the bright yellow of the dandelion blossom, and the ear was pleased with the hum of busy bees and soft cooing of the turtledove, intermingled with the twittering song of birds.

Under these conditions it was not to be wondered at that the footsteps of our three friends followed the natural inclination of the fisherman's mind and led them to the banks of a small stream, on either side of which was a natural grove. In the rich loam under the forest trees myriads of wild flowers were in bloom. Gathering flowers, watching the antics of an occasonal squirrel or feathered denizen of the forest, these Sabbath strollers were enjoying themselves as only lovers of nature can under such circumstances.

As they paused beside the stream a school of minnows darting through the water caused them to forget the sacredness of the day and aroused in their minds the passion of their favorite sport.

Instinctively reaching back into his hip pocket, Uncle William drew forth a small line with hook attached, the others soon found pole and bait, and Uncle William, forgetful of all else but his favorite pastime, was soon engaged in extracting the hungry minnows from the stream.

All but the larger ones, which were 3 or 4in. in length, were returned to their native element About a half dozen of the largest minnows Uncle William concluded to take home with him.

As the sun sank near the horizon the angling was quit, and then arose the question as to how to get those fish home without attracting the attention of inquisitive eyes and gossiping tongues. The value of the fish was no consideration for taking them home, but Uncle William knew they would please his invalid boy. B. suggested tieing together the four corners of a handkerchief, placing the fish inside and then inserting flowers, so it would look to the observer that Uncle William was taking home some wild flowers with the roots attached for the purpose of transplanting. This plan was adopted, and proved all right until the party was nearly home. Passing through the town, many acquaintances who were on their way to church complimented Uncle William on his beautiful flowers. They were within a block of home, and were congratulating each other on the successful ruse for concealing the fish, when Mrs. K., a great lover of flowers, spied them passing her residence. Calling Uncle William, Mrs. K. asked what kind of flowers he had. "Oh! just some wild flowers," replied the old gentleman. "But let me see them!" insisted Mrs. K., reaching out her hand. With some misgivings, Uncle handed over the flowers. "Oh! oh! aren't they beautiful! How lovely they do smell! I will just take two or three for—ow! oh! mercy, goodness!" screamed the good lady, as one of the fish flopped out into her hand. The shrill, feminine screams of course brought the rest of the family and several neighbors, who smiled very audibly as Uncle William gathered up the fish and flowers from where they had been strewn by the frightened lady.

The next morning, when Uncle William went up to the office, the fish story had preceded him, and it took a goodly number of cigars to satisfy the boys. JOHN C. BRIGGS.

A Home-Made Rod.

PHILADELPHIA, Pa.—*Editor Forest and Stream:* "For account of whom it may concern" I want to tell those of your many readers who are interested in the capture of the wily bass of a most remarkable rod with which I did nearly all of my fishing last September in the waters of the upper Delaware. The original creation was the product of the fertile brain and skillful hands of that best of boatmen and fishermen, Millard F. Hauser. He has used one for two years past, and last autumn, on our first day out, he presented one to me, which with, I fear, rather a pitying air I decided to try, so that he would not feel hurt; the result being that for the next four weeks I discarded my cherished split-bamboos and dagama woods, and fished altogether with my latest acquisition.

As Hauser explained it to me, the method which he pursues in the manufacture of his rods is this: He procures the best pieces of Calcutta bamboo (the kind with the brown markings) which he can obtain, selecting one about 11 to 12ft. long and about 1¼in. in diameter at the butt. This he seasons on racks up against his kitchen ceiling for from four to six months. He then takes it down and gives it, at such intervals as may be necessary for perfect drying, three coats of fine coach body varnish. He then proceeds to wrap the rod over its entire length with best quality of black patent thread, of which it requires about 1,200yds. for a rod. This is followed by three or four more coats of outside varnish, each one of which is allowed to dry thoroughly before the next one is applied. The tip, guides and reel bands are put on in the usual way and their wrappings varnished, and the rod is done.

This method of treatment seems to work a radical change in the nature of the bamboo. It produces a rod which is elastic to a degree which will almost permit one to throw a fly with it, and it cannot be broken. I have seen Hauser with one of these rods and without a sinker cast a helgramite or stone catfish over 100ft., manipulating it as he would a fly rod, and I found no difficulty in casting from 80 to 90ft. The tip can be doubled back upon the butt with the absolute certainty that no fracture will result, and one can strike a fish as with a steel spring. Don't ask me why all this is. I don't know. I am simply giving results for which I do not pretend to account. The only objection to which I can see such a rod is open is its liability to take a "set," but this can be readily straightened out by bending it back with the hands.

Of course it does not lend itself readily to transportation by train, but where one is on the river from day to day, and the general method of locomotion is by boat, the length is no great inconvenience.

To the scoffer who "don't believe it" I can only say one thing, viz., try it.

I use the same fine line, leader, and carefully adjusted reel as hitherto.

As much of the fishing in the upper Delaware is done by "drifting," that is to say, by dropping slowly down through one of the long eddies, with your minnow or catfish 50 to 75ft. astern, and as on many occasions you will find that at the time that you want to strike your fish he is double that distance away, inasmuch as on seizing the bait they run *up stream* like a flash, it can be readily seen that a rod must have backbone to overcome the resistance of the water upon such a length of line. Many and many a time, despite the most careful handling, have my fine rods given way at the ferrules under the strain of striking a heavy fish under such circumstances, but I have never seen these rods suffer in any way.

Should any one of your readers care to experiment in this direction I should be pleased to have his experience.

WADLEIGH BROOKE.

Some More Large Fish Records.

CINCINNATI.—*Editor Forest and Stream:* I have spent a good deal of my time the last ten years fishing; generally having a month in the spring and a month each fall on Kinnikinnick Creek, a stream in Lewis county, Ky., fishing for bass and pike; and I generally have fairly good success. In the fall of 1895 I caught a large-mouth black bass that weighed 5¼lbs., and, being the largest one I had ever seen, I was very proud of it. But on Oct. 4, 1896, I caught on rod a large-mouth bass that weighed 8½lbs. and was 22⅝in. long, and 7½in. from back to belly. When I first weighed it I thought the scales must be wrong, so I sent it to Vanceburg, Ky., and it weighed 8½lbs. there, and four responsible men saw it weighed; I then sent it to Cincinnati and wrote them to show it to everybody and to weigh it. It weighed 8¼lbs. the third day after I caught it. I also caught quite a nice lot of pike: one 5lbs., two 6lbs., one 8lbs., one 10lbs., one 11lbs. Oct. 22 I caught three: one 6lbs., one 8lbs. and one 10lbs.

The oldest inhabitants of Kinney say that the 6lb. bass was the largest that they had ever heard of before I caught the 8½lb. one. GEO. C. WALKER.

The Adventures of a Mess of Minnows.

WHEELING, W. Va., March 2.—Last October, while bass fishing in the South Branch of the Potomac with a party of Wheeling and Washington gentlemen, we had our bait buckets carried away by a freshet. The water was very high and muddy for several days. When it fell we had a fruitless search for our bait.

In January one of the family with whom we had boarded saw through the clear ice one of our buckets, which he knew by the initials C. R. H. painted on it. Cutting through the ice, he fished it up and found all the minnows alive, in spite of their crowded quarters and rough and muddy journey.

Is this a hard living for minnows from 3 to 4in. long?

A. G. H.

Pennsylvania Trouting.

PATTERSON, Pa.—*Editor Forest and Stream:* As the trout season is approaching, a word from our section may be of interest to some of your readers. The streams of Juniata county have been nearly depleted by illegal fishing. Long before the season opens our streams are fished, and some vandals use fulminating caps and fuse, and destroy all the fish, little and big, in the holes where they use the explosive. Mr. Wells and I went fishing in Big Run, and only caught ten trout in a day's fishing. We were told by a young man we met that a party had taken out 150 trout by the use of explosives a few days before.

Licking Creek, which used to be one of the finest trout streams in our county, is fished in season and out of season by trout hogs, who sell their trout to hotels. They are not particular as to how they are caught, or the size of the trout. Unless some measures are taken to prevent this wanton destruction, in a very few years there will be no trout in our streams.

But notwithstanding the scarcity of trout the trout braggart is still in evidence. I have in my mind one who, like Abou Ben Adam, leads all the rest. In the following doggerel I have parodied the poem to describe his propensity; as I have left his last name blank, it may apply to others affected in the same manner:

Abou Ben ——, may his tribe die out,
Awoke one night after he had been for trout;
And there traced on the wall, to his surprise,
Were names of men who had told trout lies.
He saw their lies recorded, saw the size
Of trout they had caught with worms and flies;
He saw their measures taken good and strong,
None less than fifteen, many eighteen inches long.
He waited patiently to see whose catch was best,
And lo! Ben ——'s led all the rest.

SANCHO PANZA.

Anglers' Association of Onondaga.

AT the eighth annual meeting of the Anglers' Association of Onondaga, in Syracuse, last week, the committee in charge of ordering fish fry for the waters of this county reported that they had made requisition upon the State Commissioners in the name of the Association for the following: 500,000 pike fry for Seneca River; 500,000 pike fry for Oneida River; 5,000 trout, fingerlings, for Onondaga Creek; 1,000 black bass, yearlings, for Oneida River.

W. S. MacGregor, William Everson and M. J. French were appointed a nominating committee to name candidates for officers for the ensuing year and reported the following: D. H. Bruce for president; Henry Loftie for vice-president; J. E. Bierhardt for secretary, and Charles H. Mowry for treasurer; for members of the executive committee: L. A. Stevenson, M. H. Schwartz and W. S. MacGregor. The candidates were unanimously elected.

It was resolved that the name shall hereafter be "The Anglers Association of Onondaga," thus dropping the apostrophe from the name and changing it from the "Anglers' Association of Onondaga of Syracuse, N. Y."

The meeting resolved, after a spirited discussion, to indorse the bill now before the Legislature providing for special legislation for Oneida Lake in connection with the continuance there of a State hatchery and a bill providing for a bounty for the capture of nets illegally used in fishing.

The following committee was appointed to have charge of the arrangements for the fly-casting tourney to be held in the spring: Walter S. MacGregor, C. W. Smith, George B. Wood, Charles H. Mowry and W. S. Barnum.

Gov. Morton's Bass.

Editor Forest and Stream:

In your issue of Feb. 27 Mr. A. N. Cheney refers to a large-mouthed black bass taken from a pond on the premises belonging to Governor Morton, and which weighed 24lbs.

Mr. Cheney is very justly regarded as authority in all matters relating to fish, and unless the error in regard to this fish is corrected, the statement made by Mr. Cheney will very naturally be regarded as authentic, although the story is given by him simply for what it is worth.

It is enough to say that those who then were in the secret, and which has now become an open one, all admit that this fish did weigh 24lbs., but it happened to be a striped bass which had probably just been taken with a net from the Hudson River. It was photographed at the time and some of the photographs are still extant.

If I am correctly informed, the fish in question was never exhibited to Governor Morton, but a report was simply made to him that in drawing off his pond this fish was found, and that it was a large-mouthed black bass.

So far as I have been able to ascertain, no large-mouthed black bass have ever been taken in this county or in Ulster county exceeding from 8 to 9lbs. in weight. One was taken in Lake Mahopac some four or five years ago which was reported to weigh between 12 and 13lbs., but this weight has never been verified. J. S. VAN CLEEF.

POUGHKEEPSIE, March 8.

Trout Fishing Conditions and Fish.

Editor Forest and Stream:

The following may be of some slight interest to your readers:

The season was the last of May, 1896. Lakes east of Moosehead. Weather cold and raw, high winds, small chance for fly-fishing. Twenty-two fish caught, smallest weighed nearly 2lbs. Three only were caught on ordinary trout flies, the rest by trolling. Method used, a strong leader over two large black bass flies, and either small spoon or very small minnow strung on a large hook same way as when casting for bass. Two lines made up in this style simply with flies of different kinds, one with sinker, the other a surface line. By these measures my guide and myself were enabled to capture the fish.

The photograph I send is of the four larger ones, weights 6lbs., 5½lbs., 4¾lbs., 4lbs.; all handsome fish and good fighters; none taken on the spoon, several on the minnow. The rest struck the large bass flies well, as they were fairly deeply sunk. Casting the small flies over the same ground seemed to bear alone poor results. Cause was in all probability cold, windy weather and no natural flies on the surface. All fish taken were fierce biters. F. M. JOHNSON.

Mr. Conroy's Removal.

MR. THOMAS J. CONROY has removed his fishing tackle establishment from Broadway to No. 28 John street.

Trout Planted in New Jersey.

A CONSIGNMENT of 5,000 brook trout was received by the New Jersey Fish and Game Commission on Saturday, Feb. 27. The fish measured from 3 to 5in. in length, 3,000 being planted in north Jersey streams, 1,000 at Woodbury, and 1,000 were divided between several streams in the vicinity of New Egypt. None of the fish were lost in transportation. The Commission has contracted with Toledo, O., parties for a large number of adult pike-perch for stocking streams and ponds.

WILD HONEY.

A Trout Stream Threatened.

LATONA, Wash.—I am "down in the mouth" these days because the Government has got a fool idea into its head to build a ship canal right straight up my favorite trout stream from Salmon Bay into Lake Union! What right has the Government got to ruin a fellow's picnic that way? Guess I'll get out an injunction.

"Angling Talks."

WE have a very few copies of George Dawson's "Angling Talks," a series of chapters of entertaining chat about men, fishermen, fish, fishing and fishing places. Cloth, 50 cents. Forest and Stream Publishing Co.

The Kennel.

FIXTURES.

BENCH SHOWS.

March 10-13.—CHICAGO.—Mascoutah Kennel Club.
March 24-27.—PITTSBURG.—Duquesne Kennel Club.
March 17-20.—LOUISVILLE—Kentucky Kennel Club.
March 30-April 2.—BALTIMORE.—Baltimore Kennel Association.
March 30-April 2.—KANSAS CITY.—Kansas City Kennel Club.
March 3-April 3.—SAN JOSÈ.—Santa Clara County Poultry and Kennel Club.
April 7-10.—STOCKTON.—Stockton Kennel Club.
April 14-17.—LOS ANGELES.—Southern California Kennel Club.

FIELD TRIALS.

Sept. 6.—Manitoba Field Trials Club, Morris, Man.
Nov. 2.—Monongahela Valley Game and Fish Protective Association's trials, Greene county, Pa.
Nov. 8.—Union Field Trials Club's trials, Carlisle, Ind.
Nov. 15.—E. F. T. Club's trials, Newton, N. C.

ST. LOUIS BENCH SHOW.

THE second bench show of the St. Louis Kennel Club opened at the Exposition Building Wednesday, March 3. On the opening day the weather was favorable. The attendance, especially at night, was very large, although the cash box was not largely benefited, as most of those in attendance came in on complimentary tickets, the club being lavish in their distribution—more so, it is said, than Boston, New York or Chicago. It is supposed here that all others will follow the swell set, and complimentaries were lavished on them. Last year this plan worked well. It remains to be seen if it will pan out so well this year.

The dogs were well in their stalls Wednesday by 12 o'clock, though some owners complained they had no stall tags sent them, and had to ask for their tags on arrival. The judging in four rings commenced at 1 o'clock Wednesday. Mr. Trickett, having the smallest class, soon finished his labors. Mr. Watson also finished his by Wednesday night, and left the same night for the East. Mr. Mason, Mr. Mortimer and Dr. Stahl having too many classes for one judge did not finish until Friday afternoon. The judging, with the exception noted in their respective classes, was as satisfactory as judges usually perform those arduous duties. In some instances the judges had to wait longer than necessary for the attendants to bring in the dogs. The judges, having passed on all dogs in the open and other classes, would often consume time by having the dogs brought in the rings a second and third time to award specials. The judges, having seen the dogs and passed on them once, could have taken their award sheets and gone over them and saved time in awarding the specials. The specials were given almost exclusively to the dogs owned in St. Louis. Five specials were mentioned in the regular classes sent out with entry blanks. The committees attending to the donating and collecting of the specials did not report the result of their labors until the Saturday before the show and after the entries had closed. These specials did not add a single entry to the show because no one knew anything of them when they made their entries. The club was clearly outgeneraled in the price paid for the Exposition Building, and paid dearly for their acts. The same building, your reporter was told, was rented for other purposes for the same length of time the club used it at two-thirds less, a saving of $1,000 to the club. We were also informed by one of the officers of the club that the club refused an offer of $1,000 bonus for the show, the party to pay all expenses of the show, which offer was declined. Another officer, who ought to know, said he had not heard of such an offer. Had one been made, however, he would have voted to decline it, as in his judgment the club would have done better by running the show itself.

There seems to be a wide difference of opinion among the officers of the club as to the best policy of running the club, and unless same is harmonized before another show is held, it will not be to the advantage of the club. The dogs were benched in the different naves of the exposition building by Spratts. The benches were too close together. There was no room for visitors to pass in the aisle between the benches with a moderate attendance; when a crowd, it was an impassable jam. The naves, being wide apart, were confusing to visitors. The building was comfortably heated, and lighted by arc lights when the weather was gloomy, which it was the second day of the show—the worst day, a steady rain falling all day and night that partly froze as it fell, which could not have made an outing less attractive, and the attendance reflected the weather for that day and night. The attendance on Friday and Saturday will have to be very large to pull the club out whole. Friday the weather was all that could be desired; quite a change from Thursday. Friday the attendance was better in the afternoon. The weather being favorable, a record breaker will have to be made on Friday night.

The local fanciers came up with about 400 entries, a good showing. The local greyhounds swept the decks, beating the cracks in the challenge classes when they went for the specials. The interest in this breed is very great here, St. Louis being quite a racing center. The total entries were 948, with the usual number of absentees.

There is much kicking in regard to the specials that go to the St. Loius owners. The St. Louis merchants donate these specials, it is true. The local exhibitors think they ought to have them, and the outsiders think they ought to be up open to all exhibitors; so there you are.

The pointer class was about the average run. No sensational new stars made their appearance. Mr. Geo Gould's kennel carried off the premier honors, capturing the kennel prize and first, dogs 55lbs. and over, with Furlough Mike, defeating a good field. Among the good ones he beat were Heath's Roswell and Ashford's great field trial winner Von Gull. The latter was shown in bad shape, looking as if he had been stuffed for the occasion, throwing him out of symmetry. In the 50lbs. and over bitches Geo. Gould won with Furlough Bloom, beating a fair field. In challenge class, dogs under 55lbs., Ridgeview Comet won, beating Shotaway. Lady Gay Spanker added another to her long list of wins. In the open dogs, under 55lbs., Mark Tapley, a young dog of excellent symmetry, won, his greatest defect being in head, that may improve with age. Furlough Maud won in the bitch class under 50lbs., beating a fair field. Von Gull shows much quality and pointer character. We thought him superior to Furlough Bang, placed over him. Bang was shown for all he was worth. Von Gull was handicapped on account of his condition. Sedalia Wid, third, open dogs under 55lbs., though a good dog, begins to show age, and ought to be retired from the bench. Molton Banner was first in challenge over 55lbs. Alice Leslie beat Josie Bracket, a decision we do not agree with.

English setters were not up to last year in quality. With Rodfield absent and Marie's Sport out of form, Cincinnatus Pride had an easy win in the open class, though he was shown too fat, and was soft in flesh. Your reporter thought Marie's Sport, though short of feather, ought to have been placed second over Santa Fé, placed second, beating him in body, legs and symmetry, equaling him in head; Santa having the best tail and the most feather—the latter, with some, like charity, covers a multitude of defects. He should have been placed over Count Seven (third), being superior in all points to Count. Cactus had no opposition in the challenge dogs. Flower of Sulphur, the only entry in the challenge bitch class, was absent. In the open English setter bitch class Minnie K. again scored first, with something to spare. Miller's Nellie, second, won first here last year in novice class. She is a nice bitch, full of quality, her head being her weakest point. Lady F., third, is only a fair bitch. The others in bitch class were a poor lot. Puppies were nothing that bid fair to make a sensation on the bench as they grow older.

In the field trial class Marie's Sport was the only one present. There was quite a number of absentees.

Irish setters made a better showing in quality than the English setters. Finglas seems to be invincible in the challenge class, and added another win to his already long list. Bessie Finmore beat Ruby Glenmore in the challenge bitch class. St. Elmo, winner of first in open class, is a good dog and won his first from a good field. Prince Elcho, second, shows Irish setter character enough to compete in hot company. Kildare Swiveler is another good dog, and in less hot company is liable to go higher. Timothy Titcomb, reserve, is a very fair dog. Like all of Mr. Morgan's dogs, he was handicapped by want of condition. Ruby Glenmore, reserve, is also a good dog. Letters were bestowed liberally in this class, showing it was a good one. In the open bitch class Bessie won, with something to spare. Belle Kildare, second, was closely pressed by a puppy, Blanche Finmore, about nine months old and winner of third; if she lives she will crowd the best. Niva, reserve, was only fair; the others were quite ordinary. In the novice class Blanche Finmore had an easy win. Moose is a very fair bitch, but does not belong in the same class as the winner of first. None were good enough for third. Bessie, reserve, is an ordinary bitch.

If we are to judge Gordon setters by those shown, they are going down hill. They did not compare with those shown last year; Heather Lad, in the challenge class, being the only good one, and he is nothing extra. No entries in challenge bitch class. In open dog class Dwight Grouse is a very poor specimen. Lad View, second, is not so good as the winner of first. Gordon, winner of third, is still a worse dog than winner of second. Of the others, the less said the better. In open bitch class, Mabel, winner of first, like the dogs, was poor. Dwight Sarah, winner of second, not so good. Rosalind, winner of third, still worse. In the puppy class for dogs those shown did not indicate the breed was being improved. Monx Carl won first; Don II., second. The Gordon setter puppy bitches showed a poor one in May Simmons, the only entry.

Beagles showed up well. These little musicians were out in strong force and were of good quality. In challenge dogs Ringleader scored another win to the many already won. Lonely was the winner in challenge bitch class. Dogs over 13in. found the winner in Ringwood. Newton Spot, second, is a good typical beagle. Karlo, third, is also a beagle all over. In bitch class over 13in. Lady Glenwood scored first; second went to Girl. Thorwood, the winner of first in class for dogs 13in. and under, is a typical beagle. Roving Mike, second, and Royal Dick, third, are both good hounds. In puppies, dogs, Thorwood scored first, Sherry Boy second. In bitches, puppies, Marvel was first, the only entry.

American foxhounds, challenge dogs and bitches, had only Big Strive. In open dogs, Hagan caught the judge's eye for first and second with Raleigh and Joe Blackburn, Judge Laughlin securing third. Bitches had Hagan & Walter's Flash show up winner of first; and a grand foxhound she is. If the writer was asked to select the most typical dog or bitch of any breed in the show he would select Flash. Second was won by a good bitch, Flashaway. Fashion, third, was also good. The hounds are better than usually seen at shows.

In field spaniels there was no entry in either dog or bitch class. In open class for dogs over 28lbs. (black) first went to Endcliffe Bishop, second to Endcliffe Ben, the only two entries. Both dogs showed well. In bitches over 28lbs. (black) Endcliffe Myrtle was the only entry. Field spaniels, open dogs, any other color, the only entry was Uncle Vic. The judge thought he was only good enough for third. No entries in field spaniels, open bitches, any other color, and in puppy class. Field spaniels, novice dogs and bitches: first prize withheld, second went to Monte Christo. Cocker spaniels, challenge dogs, black or liver: the only entry that faced the judge was Brother S., who won first.

P. H. BRYSON.

AWARDS.

FOXHOUNDS (American)—CHALLENGE *Dogs and Bitches:* 1st, Hagan & Walker's Big Strive.—OPEN—*Dogs:* 1st and 2d, Hagan & Walker's Rawleigh and Joe Blackburn; 3d, C. Campbell and Judge H. D. Laughlin's Bob. *Bitches:* 1st, Hagan & Walker's Flash; 2d and 3d, C. Campbell and Judge H. D. Laughlin's Fleek and Gypsy.

POINTERS.—CHALLENGE—*Dogs* (55lbs. and over): 1st, Glenrock Kennels' Moulton Banner. *Bitches* (50lbs. and over): 1st, E. M. Beale's Alice Leslie. Res., G. J. Gould's Josie Bracket.—OPEN—*Dogs* (55lbs. and over): 1st, G. J. Gould's Furlough Mike; 2d, C. Heath's Heath's Roswell; 3d, T. T. Ashford's Von Gull. Res., G. C. Burleigh's Frassy. *Bitches* (50lbs. and over): 1st, G. J. Gould's Furlough Bloom; 2d, F. J. G. McArthur's Ightfield Blossom; 3d, H. H. Mayberry's Alabama Girl. Res., Monocacy Valley Kennels' Queen of Monocacy.—CHALLENGE—*Dogs* (under 55lbs.): 1st, G. J. Gould's Ridgeview Comet. Res., G. W. Lovell's Shotaway. *Bitches* (under 50lbs.): 1st and res., G. J. Gould's Lady Gay Spanker and Miss Rumor.—OPEN—*Dogs* (under 55lbs.): 1st, J. W. Scudder's Mark Tapley; 2d, G. J. Gould's Furlough Bang; 3d, M. Voorhees's Sedalia Wid. Res., R. B. Morgan's Sir Hector. *Bitches* (under 50lbs.): 1st, G. J. Gould's Furlough Maud; 2d, G. W. Lovell's Cyrene; 3d, M. A. Brueggeman's Queen IV.—PUPPIES—*Bitches:* 1st, G. J. Gould's Furlough Maud; 2d, C. D. Ploeser's Princess Bonnie. Res., B. Reusch's Rippointa.—FIELD TRIALS—1st, T. T. Ashford's Von Gull; 2d, H. H. Mayberry's Alabama Girl.—NOVICE—1st, G. J. Gould's Furlough Bloom; 2d, T. T. Ashford's Von Gull. Res., J. W. Scudder's Mark Tapley.

ENGLISH SETTERS.—CHALLENGE—*Dogs:* 1st, J. Brett's Cactus.—OPEN—*Dogs:* 1st, E. A. Burdette's Cincinnatus Pride; 2d, L. Rausch's Santa Fé; 3d, Atkins Bros.' Count Seven. *Bitches:* 1st, E. H. Kessler's Minnie K.; 2d, Cole & Barker's Miss Jimmie; 3d, C. Thoman's Lady T. Res., G. A. Wilkins's Adelina Patti.—PUPPIES—*Dogs:* 1st, R. B. Morgan's Dan M.; 2d, R. B. Morgan's Platt M. Res., E. E. Ray's Doctor Ben. *Bitches:* 1st, R. B. Morgan's Jess M.; 2d, R. B. Morgan's Jeanette M.—NOVICE—1st, L. Rausch's Santa Fé; 2d, Atkins Bros.' Count Seven.—FIELD TRIALS CLASS—1st, H. B. Ledbitter's Marie's Sport.

IRISH SETTERS.—CHALLENGE—*Dogs:* 1st, W. L. Washington's Finglas. *Bitches:* 1st, W. H. Eakins's Bessie Finmore. Res., W. L. Washington's Ruby Glenmore.—OPEN—*Dogs:* 1st, S. Coulson's St. Elmo; 2d, R. F. Straine's Prince Elcho; 3d, W. C. Washington's Kildare Swiveler. Res., R. Morgan's Timothy Titcomb. *Bitches:* 1st, S. L. McBride's Bessie; 2d, W. L. Washington's Belle of Kildare; 3d, W. H. Eakins's Blanch Finmore. Res., Mrs. C. Darling's Neva II.—PUPPIES—*Dogs:* 1st, H. C. Curtis's Dan Deronda. *Bitches:* 1st, W. H. Eakin's Blanch Finmore.—NOVICE—1st, S. Coulson's St. Elmo; 2d, Dr. H. J. Cummings's Moose. Res., S. L. McBride's Bessie.

GORDON SETTERS.—CHALLENGE—*Dogs:* 1st, J. R. Oughton's Heather Lad.—OPEN—*Dogs:* 1st and 2d, J. R. Oughton's Dwight Grouse and Lad View; 3d, Woodbury Kennels' Gordon. Res., R. Schmidt's Don Bruce. *Bitches:* 1st, J. Redfield's Mabel R.; 2d, J. R. Oughton's Dwight Sarah; 3d, P. Lauff's Rosalind. Res., R. Schmidt's Don's Libbie.—PUPPIES—*Dogs:* 1st, C. L. Kruse's Monk Carl; 2d, Dr. J. Whitaker's Don II. Res., J. H. Schlachter's Chas. Simmons. *Bitches:* 1st, J. Schlachter's May Simmons.—NOVICE—1st, J. Redfield's Mabel R.; 2d, G. C. Kleinecke's Pansy.

CHESAPEAKE BAY DOGS.—*Dogs:* 1st, H. McAllister's Bret.

FIELD SPANIELS.—OPEN—BLACK—*Dogs:* 1st, Toon & Thomas's Endcliffe Bishop; 2d, E. W. Stern's Endcliffe Ben. *Bitches:* 1st, Toon & Thomas's Endcliffe Myrtle.—ANY OTHER COLOR—*Dogs:* 3d, Woodbury Kennels' Uncle Vic.—NOVICE—2d, T. J. Curran's Monte Christo.

COCKER SPANIELS.—BLACK OR LIVER—CHALLENGE—*Dogs:* 1st, Swiss Mountain Kennels' Brother S. *Bitches:* 1st and res., Swiss Mountain Kennels' Gabrielle and Dart.—ANY OTHER COLOR—1st, Swiss Mountain Kennels' Goldie S. Res., Brookside Kennels' Lorraine.—OPEN—BLACK—*Dogs:* 1st, G. Douglas's Havoc; 2d, C. G. King's Governor; 3d, Swiss Mountain Kennels' Guy S. Res., Woodbine Cocker Kennels' Woodbine Prince. *Bitches:* 1st, Brookside Kennels' Woodland Belle; 2d and 3d, Swiss Mountain Kennels' Lady Betty and Susanne. Res., G. Douglas's Woodland Countess.—RED OR LIVER—*Dogs:* 1st and 3d, Swiss Mountain Kennels' Raven R. and Darby S.; 2d, Brookside Kennels' Brookside King. Res., G. Douglas's Red Spark. *Bitches:* 1st, 2d and res., G. Douglas's Silk Gown, Edgewood Hebe and Rosa Belle; 3d, Swiss Mountain Kennels' Hope.—ANY OTHER COLOR—*Dogs:* 1st, Swiss Mountain Kennels' Cupid S. *Bitches:* 1st, W. T. Payne's Belle; 3d, Brookside Kennels' Woodland Trilby.—PUPPIES—*Dogs:* 1st, G. Douglas's Premier; 2d, Swiss Mountain Kennels' Cupid S.; 3d, Omaha Cocker Kennels' Barney. Res., Woodbine Cocker Kennels' Woodbine Prince. *Bitches:* 1st, G. Douglas's Village Belle; 2d, Swiss Mountain Kennels' Jess R.; 3d, T. J. Curran's Susan.—NOVICE—*Dogs:* 1st, G. Douglas's Premier; 2d, Omaha Cocker Kennels' Barney; 3d, Swiss Mountain Kennels' Laddie R. Res., Miss L. Y. Wear's Peter. *Bitches:* 1st, Swiss Mountain Kennels' Susanne; 2d, G. Douglas's Village Belle; 3d, A. B. Koenig's Missouri Belle. Res., J. E. Fleming's Bona Vera.

American Pet Dog Club.

THE annual meeting of the American Pet Dog Club was held on Wednesday, Feb. 24, at the Hotel Lincoln, Broadway and Thirty-second street, New York city, at 2:30 P. M. The following members were present: Mrs. Horace Stokes in the chair, Mrs. Stephen Barnum, Mrs. Walter Stanton, Mrs. Manning, Mrs. M. A. Cunningham, Mrs. C. Frederick Spalding, Mr. E. Morris, Mr. C. Frederick Spalding and Mr. T. Farrer Rackham. By proxy, Mrs. Thomas Barr, Mrs. Charles Beach, Mr. W. J. Pryer and Mr. J. W. Burkhart.

The treasurer's report was read, showing a substantial balance in hand, and was ordered on file. The following eleven new members were duly elected: Mrs. Robert J. Lowry, Mrs. Wm. Gulliver, Mrs. James D. Leary, Mrs. Daniel J. Leary, Mrs. Morrill, Mrs. E. A. Perkins, Miss Fielding Roselle, Dr. J. D. Brown, Capt. Robert J. Lowry, Mr. W. E. Taylor, Dr. Grosvenor Lowry.

The election of officers for the ensuing year then took place, with the following result: President, Mrs. Walter Stanton; Vice-Presidents, Mrs. Stephen Barnum, Mrs. C. Frederick Spalding, Mrs. Robert J. Lowry; Treasurer, Mrs. Horace Stokes; Secretary, T. Farrer Rackham.

Trustees: Mrs. Wm. R. McKee, Mrs. Dudley Kavanagh, Miss Fielding Roselle, Mrs. Robert K. Pritchard and Miss Florence Gale.

The Executive Committee: President, Secretary and Treasurer; Mr. W. J. Pryer, Mr. C. Frederick Spalding, Mr. Edwin H. Morris and Dr. Brown.

Three new members were proposed, namely: Mrs. Anna Bernstine, Mrs. Marie Berth and Miss Sophie Berth.

The election of Delegates for the American Kennel Club was postponed, as also was the election of club's judges.

It was resolved that the secretary be instructed to tender a vote of thanks to Mrs. Stanton for the cordial and lavish entertainment given to the members of the club by her, at the state apartments of the Waldorf Hotel on Dec. 9 last. An adjournment was then taken, in order that the members might partake of the hospitalities extended by Mrs. Horace Stokes.

Gordon Setters.

NEW YORK.—*Editor Forest and Stream:* As a matter of interest to lovers of Gordon setters, please state that my Gordon setter dog Doc, winner of first in open class dogs, and my Gordon bitch champion Heather Bee won the special for the best setter dog and bitch, any breed, in the late New York dog show. The other contestants were the English setter dog champion Cactus and bitch Flower of Sulphur, and Irish setters champion Kildare and champion Queen Vic.

In Great Britain the Gordons often carry off the prizes for the best setters of any breed in the shows—a deserved tribute to the handsomest dog that walks on earth.

The silver vase which I won for the third time at the New York show, and which thus became my property, will be put up again by me for competition at coming New York dog shows.

I was much pleased to see so good an exhibition of Gordons, the best I ever saw, and hardly a poor one among them. In quality, I heard it remarked that they more nearly approached perfection than any breed of sporting dogs in the New York show. But there is room for improvement, and we breeders of Gordons must do our best to reach perfection.

As might have been expected, the number of entries in

the challenge classes of pointers and setters showed a great falling off at the New York show. If managers will give three prizes instead of one they will see the challenge dogs appear again at the exhibitions. I don't believe any other plan will bring out the good dogs that inevitably, after being so unfortunate as to win four first prizes, are buried in that tomb—the challenge classes. But getters-up of dog shows seem to think novices and puppies better entitled to encouragement.

Can nothing be done to make the exhibition less slippery? As it is now, a dog of free movement often slips on his side, while the stiff, ungainly and slow animals appear to better advantage. What a farce it is to start one's good dog on a run by the judges' order and have him slip and slide and actually appear inferior in action to a poorer specimen.

JAMES B. BLOSSOM.

Irish Terrier Club of America.

BOSTON.—Kindly mention that at the recent meeting of the Irish Terrier Club of America a rule was passed that no cropped Irish terriers born after March 1, 1897, can compete for any prizes offered by the club.

O. W. DONNER, Sec'y.

POINTS AND FLUSHES.

The secretary of the Baltimore Kennel Association writes us that, notwithstanding that the date of closing the entries has been changed to March 20, several entries already have been made. A number of new classes have been made and valuable specials also have been added.

We are informed by Mr. W. B. Wells, the honorary secretary of the International Field Trial Club, that his club's trials will commence on Nov. 16.

Wheeling.

Communications for this department are requested. Anything on the bicycle in its relation to the sportsman is particularly desirable.

WHEELING ON THE ICE.

NEW YORK, March 4.—*Editor Forest and Stream:* Upon investigation I found out that there are very few wheelmen who know anything about cycling on the ice. Some old riders said that a bicycle wouldn't stand up on the ice; others that it was an impossibility to mount while on the ice. Some offered the suggestion that a little snow would help, as it neutralized the treacherous slipperiness of the ice; but others, who knew something of the combination, said that snow was the worst possible adjunct, and that the rider who trusted to it would land on his ear before he knew what had happened.

Each one of these advisers spoke positively, and presumably from personal experience, and it seemed a difficult matter to reconcile their statements with each other and with my own experience, for I had seen wheelmen riding over glare ice with apparent ease, and I had found a light snow give good holding to the tire.

Nevertheless they were all true—you can't ride or mount a bicycle on ice, and you can; you can't ride on snow-covered ice, and you can.

It is possible or impossible, according to circumstances, and the conditions are very similar to those governing riding on asphalt. Every wheelman knows that when asphalt is wet and covered with slime it becomes treacherous, and the same is true of ice. If ice is wet, it is slipperier than slimy asphalt, while if it is dry it affords almost equally good holding with dry asphalt. A slight dust of new fallen snow has the same effect as water upon ice, but if the snow is several inches deep, or if it has become a little "set" to the ice, it gives secure tire hold and admirable riding. A parallel might here again be drawn between ice and asphalt, for a foreign substance like sand makes asphalt slippery, as those who have tried turning a corner where a sprinkling of sand covered the surface know. There is plenty of friction between the tire and sand, but altogether too little between sand and asphalt, or between the individual grains of sand themselves.

These statements regarding riding on ice are made as the result of practical experience gained on a trip up the Hudson River the last day of February. C. M. D. and myself left New York on a morning train over the West Shore R. R. bound for the nearest point on the river where the ice would hold. Two weeks before I had seen men skating near shore at Haverstraw and horses on the ice at Peekskill, forty-two miles from New York, but there had been almost continuous warm weather since then, and we were therefore not unprepared to find the Hudson open water for more than sixty miles from its mouth.

The conductor told us that at Marlboro, a station eight miles above Newburgh, we would find the first solid ice. We had checked our wheels for a shorter distance, but we had no difficulty in arranging to have them left on the train till we wanted them. The train men were very obliging, and though running the first part of its course through New Jersey, the railroad made no charge for carrying our wheels.

Four miles above Newburgh we came in sight of the first promising looking ice. Below that point we had seen nothing but small fields of floe ice, or occasionally a narrow strip fringing the shore of some protected bay. But here the river was spanned from shore to shore, with only occasional disjointed pools of open water. The presence of these open places, however, and a certain patchy appearance of the ice itself, took away a good deal from our pleasure, for they indicated that the ice was rotten and hardly safe to ride upon. We were prepared for emergency, for C. M. D. had provided himself with thirty feet of ½in. rope, which he carried in his pocket, and it was understood that in any ticklish places the two of us should ride a good long distance apart to obviate as far as possible the danger of both going through at the same time. We were not bent on any foolhardy feat, but we were determined to be prepared in case of emergency.

At Marlboro stands the first of the Hudson River ice houses. The season had been disastrous for it, as far as the ice crop is concerned, and if I am not mistaken not a single cake of ice had been cut.

On leaving the train we were met by the pleasing information that the ice was not safe and that a man had been drowned the day before while attempting to cross the river. Despite this chilling information we determined to give it a trial, and shouldering our wheels we picked our way across the barricade of great rocks that protect the tracks at this point from the river, and a moment later were standing on the frozen surface of the stream A few inches below our feet ran the powerful current of one of the world's great rivers, cruel and merciless as only inanimate nature can be. All that upheld us from its frigid embrace was a thin shell of honeycombed ice, at no point thicker than 4in., and in many places worn to its last extremity. Here and there were open pools around whose edges the gently lapping waves, driven by a south wind, were constantly at work enlarging their domain, sapping little channels back into the field here and there, and undermining everywhere.

In the early winter water looks black as ink in contrast with snow ice. Now ice and water were so nearly assimilated that there was no contrast. A day or two would see boats sailing and ducks feeding where we were standing.

We mounted our wheels without the slightest difficulty and rode up the river before the wind, keeping as near the shore as the condition of the ice would allow.

A spin of a few hundred yards sufficed to show us that in ice we had found the finest riding surface that either of us had ever tried. Absolutely level and with a surface so smooth as to offer no jarring resistance whatever, the work of pedaling was reduced to a minimum, and one felt as if there was no limit to the speed he could attain.

Ice has a quality all its own. Asphalt is always disappointing as a riding surface, for its relative smoothness is offset by a certain deadness and drag. Ice, on the other hand, seems to possess life, and the longer one rides (judging from a limited experience) the lighter his wheel seems and the less the effort it to propel it.

It struck me that ice more nearly resembled a board floor as a riding surface than anything I had ever tried.

Quarter of a mile above Marlboro a little stream came tumbling down the side of a hill, and thinking that the ice further out would be safer than where it entered the river we steered well out from shore. An ominous cracking of the ice, however, warned us that we were trying a dangerous experiment, so at the first opportunity we swung inshore again. Everywhere the ice showed short radiating clusters of cracks that betokened its early break-up.

We rode on up the river till we were in plain sight of the Poughkeepsie bridge and no great distance from it. Then we turned about, though the ice looked good ahead, and we might have ridden to Albany or the Adirondacks as well as not, and riding leisurely along ate the lunches with which we were provided. It was no great feat to ride hands off on the ice, as we found it up near Poughkeepsie.

Passing Marlboro again, we came to a long wooded point terminating in a little rocky wart upon which was perched a lighthouse. The river was open outside the point, but we rode from the ice up on the shore, and could have crossed the point without dismounting had it not been for some undergrowth that barred our way. Below this point we found occasionally a little water on top of the ice, and in such places it required the most careful riding to prevent a fall. Despite our precautions, both of us went off on different occasions in places where we would not otherwise have chosen to dismount

Once I tried a pedal mount where the ice was wet, which resulted in an inglorious failure, though previously I had had no difficulty in so mounting.

Under the influence of a warm sun the ice gradually became slipperier, and at the same time the head wind we were breasting increased in force. Under these conditions it became difficult to mount at all, as one could hardly keep his footing while starting the wheel. Eventually we found a way out of the difficulty, heading with the wind while mounting and afterward turning to our desired course. We could turn all right, and if we went slow enough the shortest turns were negotiable.

Near an old brickyard C. M. D. picked up a cast horseshoe, which he carried with him for luck. Once when we had dismounted on some bad ice for the reason that we had gotten into a sort of *cul de sac*, without room to turn, he took this and with one blow drove it through the ice. We felt the need of something lucky then, as we gingerly made our way to the shore.

We rode down the river till open water from shore to shore was within sight, only a few hundred yards away, before leaving the ice. Then we took to the railroad embankment, and as a contrast to the unexcelled riding afforded by the ice had a taste of about the worst possible. Between the tracks it was soft enough in places to nearly cover our tires, and at such times riding over the ties was only a case of Hobson's choice.

Despite the poor track, however, we made fairly good time, covering the distance between some of the mile-posts in six minutes and eventually we made Newburgh just in time to catch the train we were anxious to get. It had started to pull out of the station as we rode up to the baggage car, but the baggageman signaled and stopped it, and we got our wheels aboard.

C. M. D. wrenched a crank loose while riding on the ties across an open culvert, but otherwise our wheels stood the ordeal nobly

Riding on the ice is a success from our standpoint, and next winter we hope to make up for sport lost through ignorance by long ice rides whenever possible. J. B. B.

Yachting.

As the yachting journal of America, the FOREST AND STREAM *is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.*

YACHT DESIGNING.—XVI.

BY W. P. STEPHENS.

[*Continued from page 174.*]

AN inspection of a thoroughly equipped drafting room, even of small size, with its assortment of revolving and lifting tables, drawing boards of different sizes, cases of instruments, splines, spline weights, blueprint frames and cabinets for paper and drawings, is calculated to discourage the beginner and amateur, who is apt to consider that all of this complicated and expensive paraphernalia is necessary to the production of a design of a yacht. Such, however, is by no means the case; an outfit of this kind simply means that time is money, and where much work is to be done it pays well to have the best possible tools and appliances, and plenty of them. So far as the quality of the work is concerned, the very best may be attained with a comparatively simple and inexpensive outfit, and with this, as we shall describe it later on, the average amateur will be well content. A great many of our readers will not care to cumber themselves with any more elaborate a "plant" than can be conveniently stowed away in a desk or drawer when not in use and handled within the limits of an ordinary table.

Those who have the space at hand, and who propose to make something of a permanent occupation or hobby of designing, will find it advantageous to establish themselves in some special corner, where they can keep a good-sized drawing board permanently in position, with shelves, cupboards and drawers handily disposed for instruments, etc., and if possible several large shoal drawers in which the drawings may be preserved without rolling. The plea of convenience and easy stowage is no excuse at all for the practice of rolling drawings, even blue prints and tracings If it is in any way possible, every drawing should be kept perfectly flat and smooth, never being rolled at all. When it is necessary to roll for carrying or mailing, the drawing on its return should be carefully rolled the reverse way and laid in the bottom of a drawer, with other drawings or a thin board on top to restore it to its original flat condition. The best drawer for this purpose is one not over 2½in. deep, otherwise the pile of drawings will be so heavy that it is difficult to withdraw the lower ones. Across the back of the drawer at the top is a light board about 10in. wide, to prevent the corners and backs of the drawings from turning up and thus being torn; on the front is a strip of wood 3 or 4in. wide, and hinged to the front, its weight serving to keep the front edges of the drawings down. A loose piece may be used in place of the hinged flap if preferred (Fig. 24). It is customary to roll a drawing with the face inward, but it is often better to roll it the reverse way, with back inward, the face protected from dirt by an extra piece of paper. When unrolled the drawing will then tend to lie flat through its own weight, when if rolled the usual way the ends will curl up, and weights or pins will be required to keep it even partially flat.

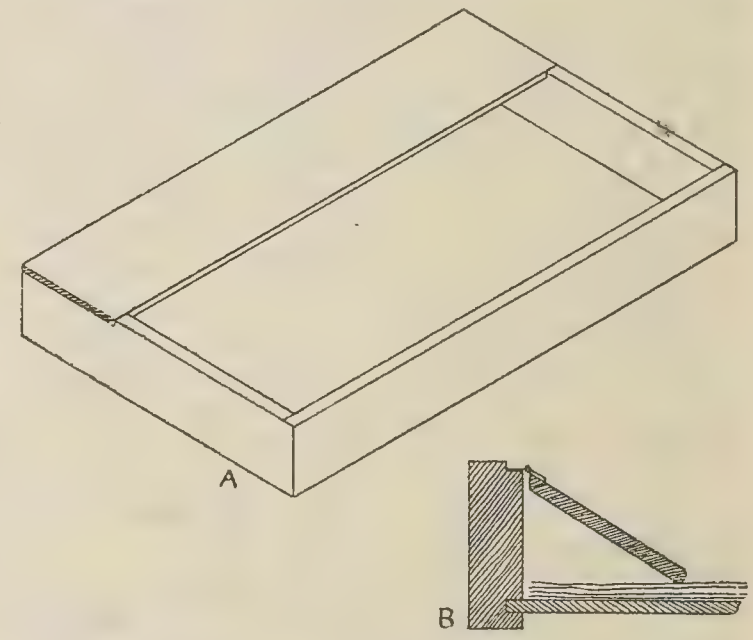

FIG. 24.

A—Drawer, with board across back.
B—Section of Drawer at Front, showing hinged strap.

A drawing represents a permanent record of some important fact, and is obtained only by the expenditure of considerable skill and labor. It is, then, worthy of careful handling when in use and careful preservation when out of use. However simple and plain it may be, it should be made neatly and carefully on a clean, flat piece of paper, with edges squared; even in the simplest and most hurried work there is no excuse for drawing in a slovenly way on odd scraps of paper of so poor a quality that it will not stand ordinary handling. The beginner is earnestly advised to make every drawing in such a way that he will not be ashamed to show it for inspection, and from the first to preserve all of his work. The habit of hasty and slovenly drafting is much more easily acquired than cured, and the amateur in particular is very likely to fall a victim to it, as he reasons that when once his yacht is finished the drawings will be of no further use to him. Even if this is the case (and if he continues the pursuit it is not likely to be) he will learn more rapidly and be a better draftsman in the end by practicing care and neatness from the first and doing everything in the best manner that he is capable of.

For professional designing, or for the amateur who has the opportunity and desire to make a permanent study of designing, the average size of paper for a design such as that in Plate II. will be about 4ft. long and 2ft. wide. A common scale of sizes established by yacht clubs for their drawings and models is as follows: For yachts of over 70ft. l.w.l. length, ⅜in. to the foot; over 46ft. and not over 70ft., ½in. to the foot; 46ft. and under, ¾in. to the foot.

A steam yacht of 200ft. length over all will measure about 48in. when drawn to a scale of ¼in. to the foot; a 90ft. l.w.l. cutter to a ⅝in. scale will also measure about 48in. over all, as will a 70ft. cutter to a ½in. scale, or a 46ft. cutter to a ¾in. scale. Going down to the smaller sizes, a yacht of 30ft. l.w.l. will measure about 48ft. over all, and a scale of 1in. is a convenient one for this size; a racing 20-footer of over 30ft. over all length will be nearly 48in. long to a scale of 1½in., and a 15 footer of about 23ft. over all will make the same length when drawn to a 2in. scale.

These are very convenient scales for the various sizes of yachts, and a *drawing board* and set of *splines* fitted to them will be ample for all ordinary practice. The lengths given

are those of the sheer and half-breadth plans, and do not allow space on the left of the drawing for the body plan, as shown in Plate II. If the length of the board will not allow of it being thus placed, it may be, as in many of the designs in the FOREST AND STREAM, a part of the sheer plan, No 6 station being the center line. This disposition of the body plan has the advantage of concentrating the whole drawing, and thus facilitating the work.

The advantages of working on a paper of this size—about 4ft. long, with a proportionate breadth of 2ft.—are that the small parts and fine lines are less complicated; quicker and more accurate work may be done with long than with short splines; the short curves, that are drawn with set curves instead of battens, may also be more accurately drawn on a large scale; and the final errors in laying down in the mould loft are reduced in proportion as the scale of the original drawing is increased. At the same time it is possible to make a drawing that is accurate and satisfactory in every way on a drawing board not over 2ft. long and 20in. wide; the outfit of *straightedges, splines, T squares,* paper, etc, being thus reduced to a much more convenient compass.

For the larger class of drawings a board about 5ft. long and 2ft. 6in. wide is ample.

A good light is one of the first essentials of the drafting room. The board should be placed near a window which faces the north, so that at no time of day is the sun directly on the drawing. The more light there is, from a skylight or side windows, the better (provided that it can be properly shaded), as on cloudy days, or toward the end of the day in winter, there will be none too much light at best. The light should fall from the left side of the board, and from above. In some situations a screen of white paper may be used to throw more light upon the board.

Drawing by artificial light is much more difficult, owing to the numerous shadows, and more trying to the eyes, and should be avoided if possible. The amateur, however, is often forced to do his drafting in the evenings. A good light of some kind, with a reflector, should be used, and in addition wax candles are most useful. Three or four of these, in perfectly clean candlesticks, may be placed directly on the drawing and shifted so as to light any particular spot.

The simplest arrangement for supporting the board is a pair of plain trestles, such as here shown (Fig 25), which

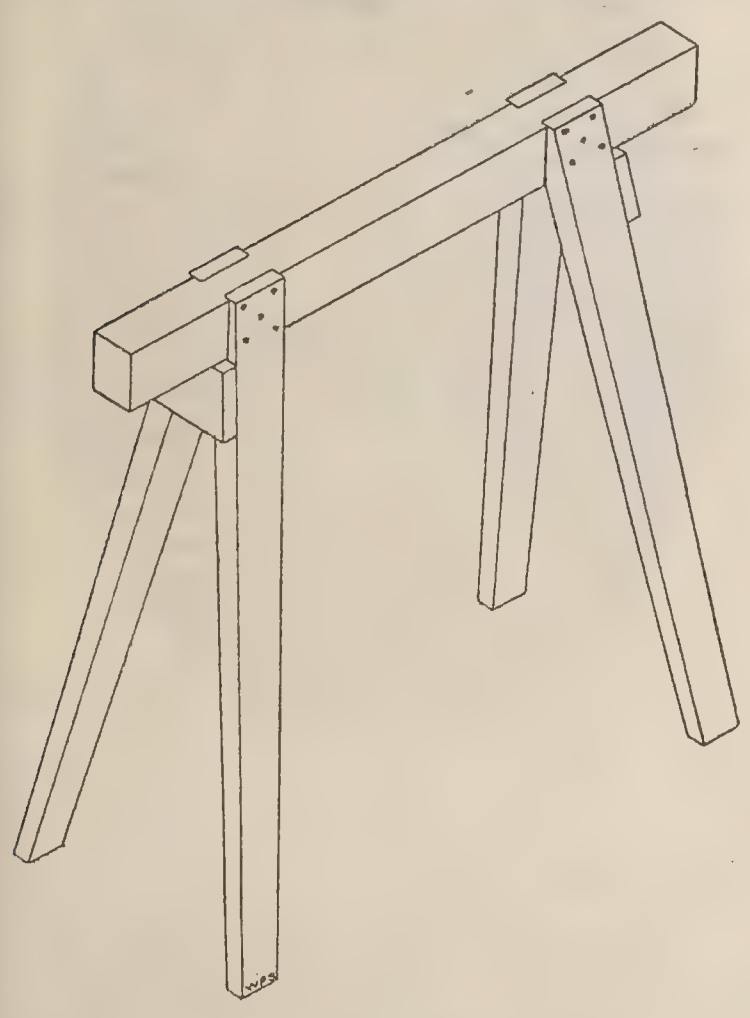

FIG 25.

Trestle, support for Drawing Board.

may be made by anyone familiar with carpenter's tools. The height may be such as to bring the surface of the board from 36 to 40in. from the floor, according to the height of the draftsman. A better plan is to use a table or a special stand about 30in. high, and on this a light framework to support the board. This framework may readily be arranged so as to be raised at the back, thus inclining the board toward the draftsman. On the table and under the drawing board is a space for weights, tools, etc., making it an easy matter to keep the board itself clear of all encumbrances (Fig. 26).

It is the general custom to use a board that is fixed both laterally and vertically, but no one who has once realized the comfort and convenience of a first-class adjustable drawing table will care to endure any longer the primitive fixed board. The writer has used for a number of years one of the smaller and simpler makes of adjustable table, with tilting top, but 20×24in.; this being large enough to support a drawing board 42×30in. The board was simply laid on the table, the slight ledge along one edge of the table fitting into a groove in the under side of the board. In using a dozen or more spline weights of nearly 5lbs. each, as was constantly done, some care was necessary, the clamp controlling the tilting of the top had to be set up tight, and the weights had to be distributed over the center of the table, and not all placed on one corner or one edge.

This table has more recently given place to one of newer and more elaborate construction, and greatly superior. The top is 48×30in., carried on a strong central standard, which permits it to turn freely. A hinged connection, with strong clamp between the top and standard, admits of the top being tilted and secured in any position, from the horizontal to the vertical. The standard is arranged with a strong spiral spring, which balances it and the top at any height from 34 to 44in. above the floor, and it can be clamped at any point within this range of height, either so as to revolve, or to be firmly locked to the base. Being mounted on castors, it can be moved at will, as light and other considerations demand; by day its place is in a bow window facing N E. by N.; in front of it below the front window is a shelf for splines and a lower one for weights; at the right is another shelf for the instrument case, inks, etc., with long scales, T squares and straightedges hung above on the wall. Beside it stands the smaller and older table, with top 24×20in., a convenient place for the small scales, tools, curves, etc., that would otherwise cover the drawing. When occasionally used by night, it is wheeled over under the rays of a wall lamp, with other lamps on a fixed table

When in use the top is clamped in any convenient position; for plotting and small measurements, or drawing body plan and details, it is raised to a good height, allowing the draftsman to stand erect or sit on a high stool. When drawing long lines it is lowered, and if these lines are near the further edge it is placed very low, so as to allow the draftsman to reach over easily. (In similar work at a fixed table a movable step 3 or 4in. high is necessary.) Sometimes the top is tilted slightly in lettering or figuring, and on occasion it is made vertical like an easel, the drawing being pinned fast.

At whatever height it may be, the top is in constant circular motion; when a measurement is taken from one part of the drawing, a mere touch turns the table and brings another part near to the hand; the turning of the top allows all

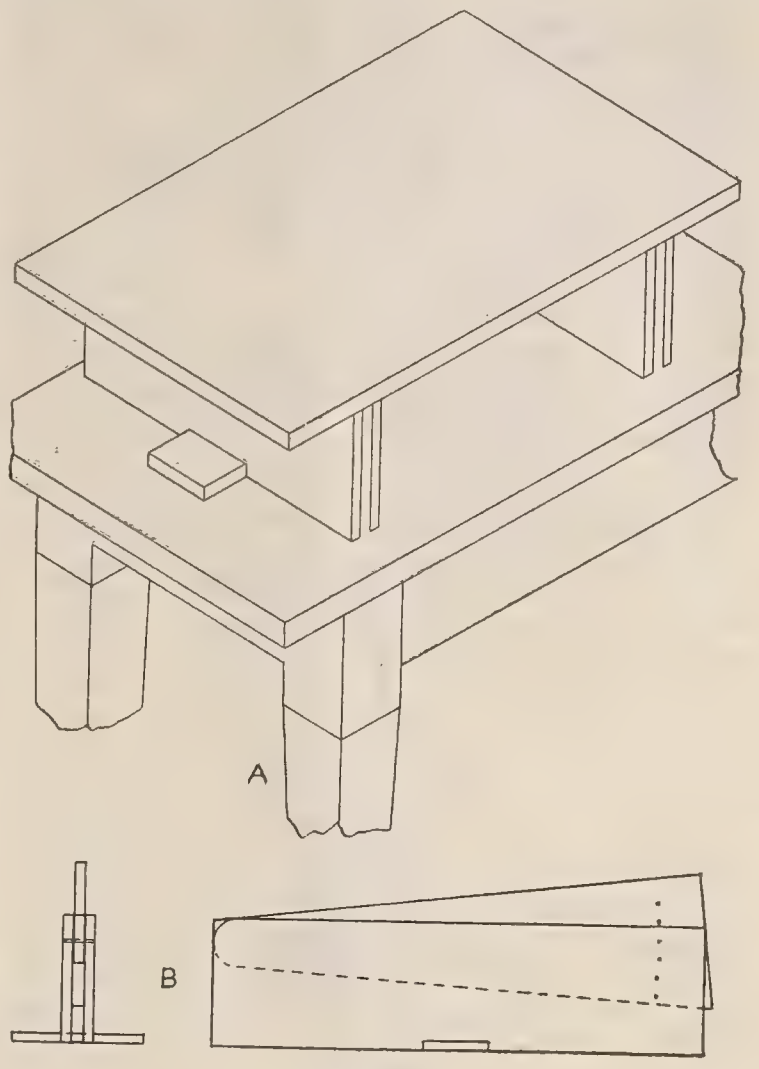

FIG. 26.

A—Drawing Board on Table.
B—Support for Board, center piece pivoted to raise at back.

curves, large or small, to be drawn from the *inside* instead of from the *outside,* as already described in a previous chapter. It also obviates the necessity of reaching all the way across the drawing to draw the lines at the top. One of its greatest advantages is the change of position which it permits the draftsman to enjoy; after drawing for an hour with the top at a certain height it may be lowered several inches, permitting a totally different position. Anyone who has spent ten consecutive hours over a fixed table will appreciate the blessings of this scheme.

The base being comparatively small, the spline weights cannot be thrown recklessly around, as on a fixed table, but if used with reasonable care there is no difficulty or danger in piling on 60lbs. or so of lead. It is a great convenience, too, when a spline is finally adjusted, to be able to swing the table until the light is thrown in exactly the right position along the edge of the spline. While the top is made as a drawing board, smaller boards can of course be used on it. The cost of such a stand, from $15 to $18, is a small item when much drawing is done and time is an object. It is not practicable to use a revolving top of over 48 to 50in. length, a slight disadvantage when the drawing is of the length we have given as desirable, but this is a small point against the many in its favor.

A Fresh-Water Challenge Cup.

THE Green Lake Y. C., of Dartford, Wis., is one of the many clubs established of late years on the numerous small lakes of Wisconsin and Minnesota, and devoted to the racing of modern yachts of the smaller classes. The inter-lake competition in the different localities is very strong, and every effort is made to secure the fastest and most improved craft. The following explains itself:

DARTFORD, Wis., Feb. 15.

The Green Lake Y. C., in its efforts to promote yachting intercourse between clubs on Wisconsin lakes, invite you to participate in a contest for a challenge cup, given by the club, under the following rules and regulations, viz.:

ARTICLE I. NAME.—This cup shall be called the Green Lake Yacht Club Challenge Cup, and is offered as a perpetual challenge cup for all inland lake yacht clubs of Wisconsin, to be contested for annually by representatives of these clubs. The following regulations shall govern all contests for the cup, wherever held:

ARTICLE II. CLUBS ELIGIBLE FOR COMPETITION.—The cup shall be subject to challenge from any organized inland lake yacht club in the State in good standing having not less than twenty active members and not less than three yachts, measuring at least 15ft. on the waterline, in ballast without crew aboard.

ARTICLE III. CHALLENGING.—Application for competition shall be made in writing from the secretary of the challenging club to the secretary of the club holding the cup, and shall be made not later than June 20 of each year. All contestants entering shall sign an agreement in duplicate to abide by the rules and regulations governing the cup, one copy of which shall be sent to the secretary of the club holding the cup and one to the secretary of the Green Lake Y. C., to be placed on record. Blanks can be had upon application to the secretary of the Green Lake Y. C.

ARTICLE IV. NUMBER OF ENTRIES.—Entries from each club, including the club holding and defending the cup, shall be limited to one boat, to be chosen by the club from its registered fleet.

ARTICLE V. NUMBER OF RACES.—The contests for the cup shall consist of three races. The first two shall be open to all challengers, and the third to the winners of the two previous races only. The boat winning two of the three races shall take the cup. One of these races shall be sailed over a regular triangular course, and the other over a course equivalent in length straight to windward or leeward and return, the course to be sailed being determined by the sailing committee on the day of the race, and the contestants notified not less than half an hour before the start of the race.

ARTICLE VI. DATE OF RACES.—The first race shall be sailed on the first Saturday of August of each year, the second and third on the Monday and Tuesday following, respectively.

ARTICLE VII. SIZE OF CONTESTING YACHTS.—The size of the contesting yachts shall not be less than 16ft. nor more than 25ft., racing length, as calculated by the measurement rule hereinafter specified.

ARTICLE VIII. COURSES.—In arranging contests for the cup, clubs shall provide courses of a length of at least eight miles and with a depth of unobstructed water over the entire course of at least 7ft.

ARTICLE IX. MEASUREMENTS.—The formula for determining racing length shall be as follows:

$$\frac{\text{L. W. L.} + \sqrt{\text{S. A.}}}{2} = \text{Racing Length.}$$

Yachts shall be measured without crew on board, but instead thereof, at the time of measurement, a weight of 150lbs. for every 4ft. or fraction thereof exceeding one-half of the load waterline shall be placed amidships to represent the crew.

L.W.L. (load waterline) is length on the waterline exclusive of any part of the rudder or rudder stock ascertained when the yacht is afloat, as above, with all fixed ballast in proper place and crew aboard.

S. A. (sail area) shall be the actual spread of canvas carried, calculated from measurements taken as per the rules of the Green Lake Y. C.

ARTICLE X. SHIFTING BALLAST.—After measurement, no shifting of dead ballast before or during a race shall be allowed. A weighted centerboard shall be considered fixed ballast. No outrigger or other mechanical device for carrying live ballast outboard shall be allowed

ARTICLE XI. TIME ALLOWANCE.—The time allowance shall be calculated by the Herreshoff tables.

ARTICLE XII. CREW.—The crew, exclusive of the captain, shall be limited to one man for every 4ft. or fraction thereof exceeding one-half of the load waterline length. Each contesting boat shall be sailed and manned entirely by active amateur members of the club to which the boat belongs.

ARTICLE XIII. STARTING.—The judges' boat shall fly flag ..... on the after staff upon leaving for the race course, said flag to remain hoisted until the race is finished or declared off.

The judges' boat, having been brought to the proper position at the starting buoy, shall fire a gun and hoist a flag ..... at the forward flagstaff. This signal shall remain in position five minutes. At the expiration of that time it shall be lowered and a gun fired, which shall be the signal to start.

The time of all boats shall be taken from the signal.

ARTICLE XIV. RACING COMMITTEE.—The racing committee shall consist of one representative appointed by each contesting club from its membership, they to choose from some regularly organized yacht club one additional member, who shall act as chairman.

This committee shall have general charge of races, the power to fix the starting time, the time limit, etc., for each race, and the appointment of judges and timekeepers.

ARTICLE XV. JUDGES.—The judges shall be invested with the usual powers of such officials and may postpone any race at their discretion.

ARTICLE XVI. REVERSION.—In case any yacht should disorganize, or fail to comply with all these rules while holding the cup, the cup will at once revert to the Green Lake Y. C., and the next contest for the same will be held on Green Lake.

ARTICLE XVII. ADDITIONAL REGULATIONS.—Sailing rules and regulations not herein especially referred to shall be in accordance with the rules of the Green Lake Y. C.

ARTICLE XVIII. AMENDMENTS.—In presenting this cup to the yacht clubs of Wisconsin for competition, the Green Lake Y. C. reserves the right to alter or change the regulations governing the challenging and sailing for the same.

Biscayne Bay Y. C.

BISCAYNE BAY, FLA.—MONDAY, FEB. 22.

Eleventh Annual Regatta.

THE annual regatta of this most Southern of American yacht clubs, which was held on Feb. 22, was one of the most successful and enjoyable ever sailed on Biscayne Bay. The day was perfect, with a strong, steady breeze from the southward, and though the entries were few in number, there were enough evenly matched contestants in the several classes to make very pretty work. Besides the racing yachts, the vicinity of the course was dotted with a score of sail boats and launches from the great new Hotel Royal Palm, which has been erected and become the center of all interests in this region since my report of one year ago.

The racing course was from a stakeboat off the club house at Cocoanut Grove up the bay to the black buoy midway between Punch Bowl and Bear's Cut; thence to the inner Cape Florida Channel Buoy and thence home, making a 12-mile triangle. The first leg was run with lifted sheets; the second was a thrash to windward against a strong flood tide, and the third a run home.

Having become tired of complicated measurements involving mathematical calculations that required a professional knowledge of the subject, the regatta committee of this year returned to first principles, and doing away with restrictions as to crew, ballast or sail, based their time allowance on L.W.L. only. For this they allowed 1m. to 1ft. for each 10 miles, with results that proved satisfactory to all hands.

In Class A, which included schooners and yawls, there were but four starters; and in Class B (sloops) there were only five; but half a dozen other yachts, too timid or too indifferent to make formal entry, accompanied the racers over the entire course, and so added materially to the beauty of the show.

In the first class Com. Munroe's Utilis, which is preëminently the best all-round boat in these waters, easily dropped her own competitors, and in spite of her yawl rig made things remarkably lively for the sloops of her own size. Thus the whole interest of the race centered in the windward work of this speedy yawl and the sloops Pelican, owned by Paul Ransom, of Buffalo, and Widow, owned by Mr. Alfred Peacock, of Cocoanut Grove. The first mark was rounded by Pelican, Widow and Utilis in the order named. These three able boats were handled to perfection, and were so evenly matched that for the first half dozen tacks it was a question with the spectators as to which would cross the other's bow. At the end of the first tack Utilis led; then Widow forged to the front and held a short lead over Utilis, with a longer and ever-increasing lead space of open water between her and Pelican during the whole of the exciting thrash down along the outer banks to the second mark. This was approached by Widow and Utilis

within a biscuit toss of each other, with the former still in the lead.

In this work, however, Ralph Munroe, formerly of Staten Island, is too old a yacht sailor not to be thoroughly posted on all the neat points of the business. Thus, as they fetched close to leeward of the buoy and Widow stood off for a short tack, the Commodore made a pilot's luff, and, his boat fore-reaching handsomely, he spun around the mark with about 2in. to spare, and started for home well ahead of the bewildered Widow, who did not seem quite to understand how the trick had been done.

Utilis was not, however, allowed to enjoy this triumph unchallenged, for Pelican now started in, and after passing the plucky little Widow crept up inch by inch on the two-sticker until she was also finally passed, and the sloop headed the procession across the finish line. She was only three or four lengths ahead of Utilis, however, and was beaten by the latter boat in actual time by 13s. On corrected time she was also beaten 48s. by Widow, so that the latter now flies the championship pennant of her class for the year 1897.

The following table of elapsed and corrected times will show to those who care to study it the relative positions of the several yachts at start, finish and afterward:

	Start.	Finish.	Elapsed.	Corrected.
CLASS A.				
Utilis	10 29 03	1 08 16	2 37 13	2 39 13
Allapatta	10 28 00	1 24 00	2 56 00	2 46 00
Alva	10 17 35	Withdrew	. .. ..	. .. ..
Mischief	10 22 05	1 39 10	3 17 05	3 11 05
CLASS B.				
Widow	10 26 45	1 12 00	2 45 15	2 38 25
Pelican	10 28 30	1 07 56	2 39 26	2 39 26
Augusta	10 22 47	1 23 56	3 01 09	2 57 33
Hornet	10 19 04	Withdrew	. .. ..	. .. ..
Mattie L.	10 22 45	. .. ..	. .. ..	. .. ..
Black Jack	10 26 05	. .. ..	. .. ..	. .. ..

Two days later the club fleet, to the number of a dozen boats, sailed up to Miami, anchored in line off the Royal Palm, and as soon as darkness set in decked themselves from waterline to trucks with hundreds of colored lanterns, at the same time enveloping themselves in a blaze of glory and red fire; all of which was but a prelude to the complimentary ball tendered to the members of the club by Manager Merrill, of the great hotel.

The fine yawl Flying Cloud, which, when in Southern waters, sails under the flag of the Biscayne Bay Y. C., arrived in the bay from the North on Sunday, Feb. 28, and is now at anchor off the Royal Palm in company with Lounger, Jupiter and Gipsy. Steam yacht Buccaneer sailed for Nassau on the day previous. O. K. CHOBEE.

YACHTING NEWS NOTES.

According to a recent report, Valkyrie III. will be fitted out very soon for the British racing season.

Vigilant, cutter, has been sold by Com. Gould to Percy Chubb, former owner of Queen Mab. Mr. Chubb will use her only for cruising.

The race for the town prize of 1,500 francs off Hyeres on Nov. 3 over an eight-mile triangle, twenty-four miles, starting in a light breeze, a fresh westerly wind made a good race, Ailsa beating Britannia by 7 min. Samphire won from Malgretout by 30 sec.

The officers of the Philadelphia Y. C. are: Com., Francis Shunk Brown, schooner Helene; Vice-Com., M. R. Muckle, Jr., yawl Julnar; Rear-Com., J. J. de Kinder, Zeeland; Fleet Capt., John S. Muckle, Carol; Fleet Surgeon, W. Joseph Hearn, M. D.; Harbor Master, S. W. Bookhammer; Meas., Philip H. Johnson; Treas., Samuel B. S. Barth; Sec'y, Abraham L. English, room 604, City Hall, Philadelphia, Pa. Regatta Committee: George D. Gideon, George T. Whitaker, Geo. W. Fite. Anchorage, Essington, Delaware county, Pa.

At the annual meeting of the Shackamaxon Y. C. on March 2 the following officers were elected: Com., Wm Gaun; Vice-Com., John Engle; Fleet Capt., Frederick Anderson; Fin. Sec'y, R. B. Murphy; Rec. Sec'y, Henry S. Anderson; Treas., James Slemmer. Board of Directors: John Engle, Wm. Gaun, Smith B. Edwards, Max Schladensky, Henry S. Anderson. Measurers: Wm. Cravin, R. G. Morgan, George Le Sage. The date of the annual meeting was changed from March to the first Tuesday in January.

THE secretary-treasurer of the A. C. A. requests that all American canoe clubs having members associated with the A. C. A. will forward to him as soon as possible the name of club and list of officers.

Buffalo C. C. Dinner.

THE fourteenth annual dinner of the Buffalo C. C. was held at the Ellicott Club, on Friday, Feb. 26.

Were one to judge by the large proportion of the total membership present, the enthusiasm of the various speakers as to the future of the club, the promises which the several committees held out as to the growth and increased activity, the witty and eloquent responses to the several toasts, the many good songs and hearty choruses rendered, the gusto with which the club yell was given—an outsider would prophesy that before many seasons the burgee and deeds of the B. C. C. would be known from one side of the continent to the other.

For many years the club has struggled along with a very limited membership of a dozen genuine canoeists, but during the past two years this nucleus has gathered about itself a host of genial fellow spirits until to-day they have a full membership of 100, and before the season actually commences Sec'y Rosseel expects to raise the limit to 125.

This club, like the A. C. A., is international, as its handsome and commodious club house is on the Canadian shore of Lake Erie at Point Abino, ten miles by water from the city. There many of the most active spirits spend about four months of the year.

On account of the open water on which the club sailing is done, the sailing craft are slightly beyond the A. C. A. limits.

During the banquet Com. MacNabb outlined a scheme—which was so enthusiastically received that it is sure to become a fact—by which the club would become the possessor of ten or twelve duplicate 17ft. craft from the latest model from the shops of Gilbert, of Brockville, the noted designer and builder.

Com. MacKendrick, of the American Canoe Association, was present, and replied at length to the toast of the A. C. A., setting forth the aims of the Association and inviting the club to identify themselves therewith, which invitation was accepted in a most practical way by Vice-Com. Forbush placing in his hands twenty-eight applications for membership in the A. C. A., and before the party broke up many had expressed their intention to attend the '97 meet at Grindstone. The club owns two 25ft. war canoes, and we may expect to see a full crew paddling the B. C. C. burgee to the front in the war canoe race next August.

Success to the enthusiastic "Bisons" is the wish of their fellow-canoeists.

The Atlantic Division Meet.

AT the meeting of the Atlantic Division Executive Committee, held at the Astor House on Feb. 12, it was decided to hold a Division cruise and camp, commencing on Friday, May 28, and terminating the following Thursday, June 3, 1897.

Those participating in the cruise will meet at Easton on the Thursday evening before the day fixed for the start as above, which will enable all to get under way at a good hour the following morning. It is proposed to consume four days in making the run, with stops at Frenchtown, Park Island (the home of the Park Island Canoe Association), and Burlington Island, on Friday, Saturday and Sunday nights respectively. Full provision will be made by the cruising committee for lodging and boarding the participants at all stopping points along the river. On the Monday following the start, permanent camp will be made at Delanco, N. J., upon a beautiful site at that point, with excellent water available for sailing and paddling.

The cruising and regatta committee will issue a detailed circular about March 25, giving particulars of the cruise, its requirements in the way of boats and outfit, and a description of the interesting country through which the cruise will be made. To this the transportation committee will add directions for reaching the starting point, and getting boats and duffle to and from camp.

We hope that the Division's members will find in the novelty of this proposed cruise and camp sufficient attractions and advantages to induce them, whether they be novices or experts, to spend their Decoration Day holiday with us in large numbers, and thus make the event an enjoyable and memorable one.

Cruising and Regatta Committee: Alvin S. Fenimore; Robert J. Wilkin; Harry C. Allen, Chairman, 17 W. State street, Trenton, N. J.

JOSEPH EDWARD MURRAY, Vice-Com., Atlantic Division.

The Canoeists' Club.

THE annual dinner of the Canoeists' Club will be held at the Arena, No. 41 West Thirty-first street, on Saturday evening, March 20, at 6:30 o'clock. Members, and canoeists in general, who desire to attend are requested to remit $1.50, the cost per plate, to Mr. Thomas Hale, Jr., treasurer, No. 32 Nassau street, not later than Monday, March 15.

The officers of the Atlantic Division and the committees who have in charge the proposed Delaware River cruise and camp, from May 28 to June 3 next, will be on hand, so an excellent chance will be given for the discussion of this new and welcome departure in the Division's history.

Canoeing on the Connecticut.

Editor Forest and Stream:

A party of four is desirous of making a canoe trip down the Connecticut River from near Lancaster, N. H., to White River Junction. Can you give me any reference that will be of service in making the trip?

I would like to know especially what accommodations we would have for getting the canoes from Lancaster to the river. E. H. C.

LOWELL, Mass.

Rifle Range and Gallery.

Revolvers at the Sportsmen's Exposition.

WE have received the following note in regard to the coming revolver tournament, to be held in Madison Square Garden during the week of the Sportsmen's Exposition, March 13–20:

"The coming national championship tournament, to be held during the Sportsmen's Exposition, which opens March 13 at Madison Square Garden, is assuming importance in English eyes, according to private correspondence just received here, principally because of its revolver contest. Entries from revolver shooters are coming in to J. A. H. Dressel, secretary-treasurer of the Sportsmen's Exposition, at 377 Broadway. They include the best crack shots of the Eastern States. The Eastern experts are turning expectant eyes westward for dangerous dark horses. The country is large, however, and unknowns here and there may have easily enough attained an unheard-of accuracy which will enable them to take the Sportsmen's Association's trophy."

NEW RULES FOR THE BISLEY MEETING OF 1897.

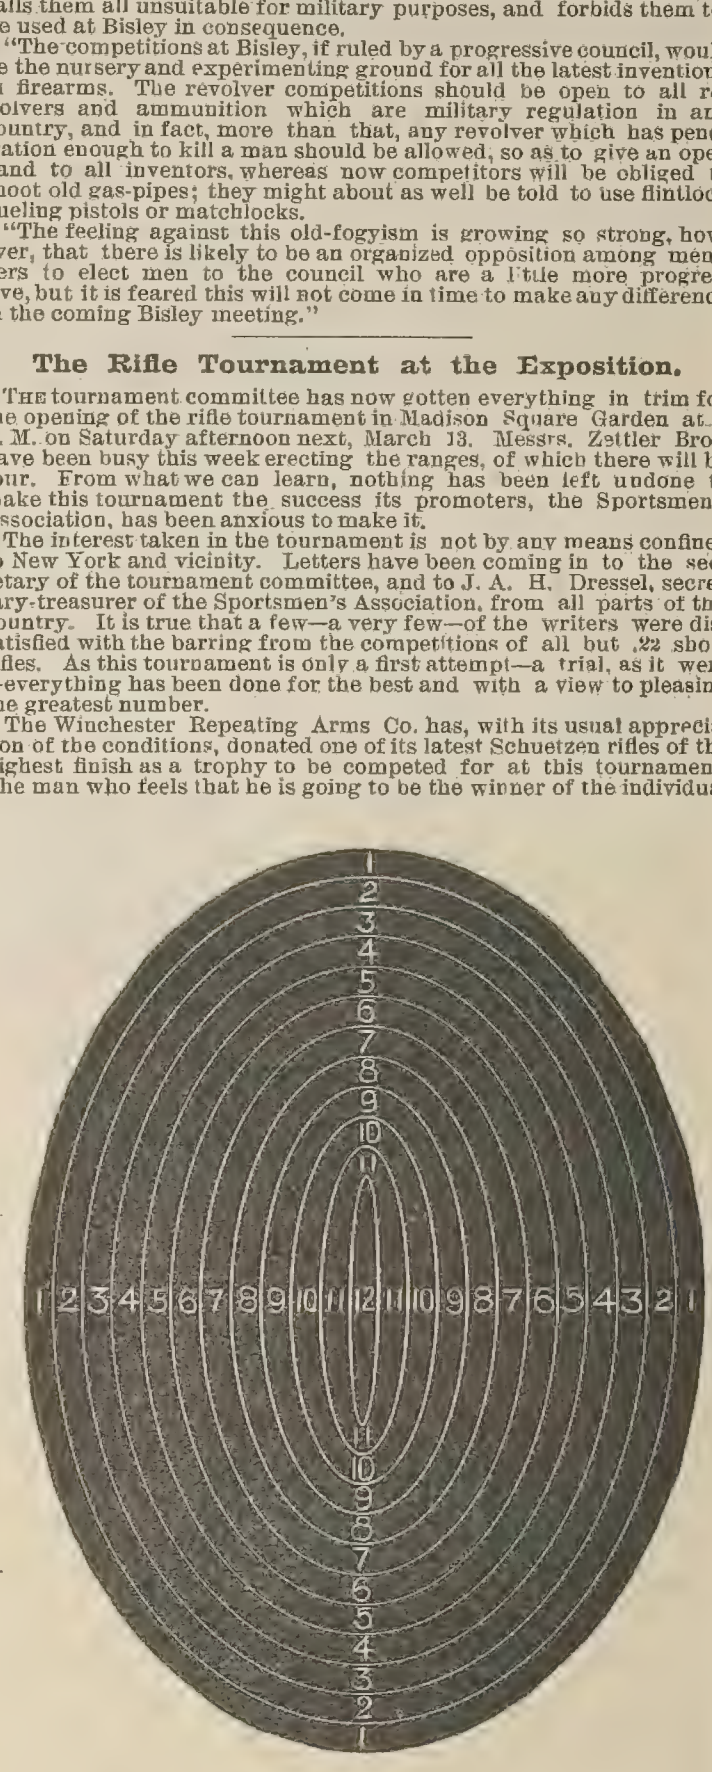
Capt. James S. Conlin, who has charge of the gallery at the Knickerbocker Athletic Club and who will also be director of the revolver shooting at the tournament referred to above, has received a letter from a famous revolver shot in England, who corresponds with him, but wishes not to be quoted on shooting matters. The writer stated that they are getting up a revolver club at Brighton, England, on the lines of the Knickerbocker's revolver club, and asked for information about building a range under cover, as all the revolver shooting in England is done in the outdoor clubs.

Capt. Conlin's correspondent reviews the new revolver shooting rules, not hitherto published in America, of the British National Rifle Association for the 1897 meet at Bisley. Mr. Conlin's friend criticises the association's prescription for revolvers because it prescribes weapons that are now generally recognized by military experts as most effective. He writes:

"The English National Rifle Association has just published its rules for revolver at Bisley for the current year's meeting. No gallery revolvers, sights or ammunition will be allowed this year (in former years there were two classes of revolvers, military and target or any, and similar prizes for each).

"The rules are very amusing, showing how very backward the English are, never adopting any improvement till it is ancient history in America, and thinking that everything English is best and nothing else worth even noticing. The rules say: 'The description of revolvers and ammunition admissible to the competitions at Bisley shall be such as are suitable for military purposes in the opinion of the Council of the National Rifle Association.' The rules then go on to give the details of the old English army revolver, not less than 44 cal., and so on, entirely ignoring the fact that this old revolver is obsolete in all other armies; the small caliber, nickel-coated bullet and small charge of smokeless powder are the only ones used by any other nation, but the Council of the English National Rifle Association calls them all unsuitable for military purposes, and forbids them to be used at Bisley in consequence.

"The competitions at Bisley, if ruled by a progressive council, would be the nursery and experimenting ground for all the latest inventions in firearms. The revolver competitions should be open to all revolvers and ammunition which are military regulation in any country, and in fact, more than that, any revolver which has penetration enough to kill a man should be allowed, so as to give an open hand to all inventors, whereas now competitors will be obliged to shoot old gas-pipes; they might about as well be told to use flintlock dueling pistols or matchlocks.



"The feeling against this old-fogyism is growing so strong, however, that there is likely to be an organized opposition among members to elect men to the council who are a little more progressive, but it is feared this will not come in time to make any difference in the coming Bisley meeting."

The Rifle Tournament at the Exposition.

THE tournament committee has now gotten everything in trim for the opening of the rifle tournament in Madison Square Garden at 3 P. M. on Saturday afternoon next, March 13. Messrs. Zettler Bros. have been busy this week erecting the ranges, of which there will be four. From what we can learn, nothing has been left undone to make this tournament the success its promoters, the Sportsmen's Association, has been anxious to make it.

The interest taken in the tournament is not by any means confined to New York and vicinity. Letters have been coming in to the secretary of the tournament committee, and to J. A. H. Dressel, secretary-treasurer of the Sportsmen's Association, from all parts of the country. It is true that a few—a very few—of the writers were dissatisfied with the barring from the competitions of all but .22 short rifles. As this tournament is only a first attempt—a trial, as it were—everything has been done for the best and with a view to pleasing the greatest number.

The Winchester Repeating Arms Co. has, with its usual appreciation of the conditions, donated one of its latest Schuetzen rifles of the highest finish as a trophy to be competed for at this tournament. The man who feels that he is going to be the winner of the individual

ZIMMERMAN SPECIAL TARGET.

championship match can look in the windows of the Winchester Co.'s New York store, 312 Broadway, and take a peep at this beautiful weapon.

Another trophy well worth winning is the Zimmerman trophy, the handsome bronze donated by Gus Zimmerman to the winner of the special match on the Zimmerman target. This trophy is also on exhibition in the windows of the Winchester Repeating Arms Co. We give herewith a cut of the special target to be used in this competition. Remember that the conditions are: Open to all; five tickets of three shots each; entrance $2 for five tickets; no re-entry; two best tickets to count; to be shot on Zimmerman special target; distance, 100ft. exact; any .22 short caliber rifle allowed. The fact that no one person can fire more than five targets, no re-entry being allowed, makes it practically anybody's trophy. This is a truly sporting match, and will create probably more interest than any other on the programme.

Another fact worthy of note is this: All persons who are members of the Sportsmen's Association—that is, who are holders of season tickets of admission to the Garden during the Exposition—can enter for the Individual Championship match on payment of the balance of $3 instead of $5, season tickets costing $2 each. The simplest way, however, is to send in your entrance money of $5 to Edward Banks, secretary of the tournament committee, Forest and Stream Publishing Company, 346 Broadway, New York city; or to J. A. H. Dressel, secretary-treasurer Sportsmen's Association, Room 1009, No. 377–379 Broadway, New York city; or to any member of the tournament committee. That insures your getting your season ticket of admission that allows you to go in and out of the Garden as often as you want while the Exposition is open to the public.

Columbia Pistol and Rifle Club.

SAN FRANCISCO, Feb. 28.—Notwithstanding the gloomy day, the Columbia Pistol and Rifle Club turned out in good numbers to-day. Some good scoring was done, notably by Mr Pape, who made 7 in three shots (Columbia target), and Dr Rodgers, who made 46 on the 10 shot record medal shoot.

Scores in detail:

Rifle, 200yds., re-entry, F. H. Bushnell medal, three shots: A. H. Pape, 7, 10, 10, 11, 11; Capt. Kuhnle, 10; Dr. L. O. Rodgers, 12; W. Glindemann, 14; F. O. Young, 15.

W. Glindemann military medal, re entry, ten shots, Creedmoor count: E. Hovey, 47, 46; F. O. Young, 46; C. F. Waltham, 45; M. J. White, 42, 41.

F. O. Young rifle record medal, re-entry, ten shots: Dr. L. O. Rodgers, 46; F. O. Young, 61; Capt. Kuhnle, 62.

Most flags during the month, cash prizes: A. H. Pape 6, F. O. Young 3, Dr. L. O. Rodgers 3, Capt. Kuhnle 2.

Pistol and revolver, re entry matches, 50yds., Gordon Blanding medal, 3 shots: F. O. Young 10, J. E. Gorman 11.

Howard Carr army revolver medal six shots: C. Roberts, 27, 35, 36, 41; A. B. Dorrell, 27, 35, 39, 40; Captain J. E. Klein, 51, 53.

Diamond record pistol medal, ten shots: J. E. Gorman 43, Ed Hovey 45, 52; F. O. Young 46, A. B. Dorrell 56.

Achille Roos 22-caliber rifle medal, 50yds., five shots: Ed Hovey, 11, 12, 12; A. B. Dorrell, 11, 12, 13; F. O. Young, 11, 13; Dr. L. O. Rodgers, 21; Mrs. C. F. Waltham, 19, 22. ROEEL.

Some Tall Scoring by Rosenbaum.

WE have received from an anonymous correspondent the details of a large score said to have been made by Wm. Rosenbaum recently. The totals for the 100 shots are very large, and we will gladly give our readers full particulars if our correspondent, who signs himself "Brooklynite," would comply with our regulations by sending us his name and address (not for publication), not omitting the name of the gallery on which the score was made.

Trap-Shooting.

Leading dealers in sportsmen's supplies have advertised in our columns continuously for almost a quarter century.

If you want your shoot to be announced here send in notice like the following:

FIXTURES.

March 16-17.—SANDUSKY, O.—Tournament of the Sandusky Gun Club. Targets, pigeons and sparrows.

March 16-19.—BAYCHESTER, N. Y.—Second annual tournament of the Cobweb Gun Club; live birds and targets. Cobweb handicap at live birds, $500 guaranteed. Open to all. Nobody barred.

March 23-25.—NEW YORK.—Interstate Association's fifth annual Grand American Handicap (live birds), at Elkwood Park. $1,000 guaranteed in the main event, all surplus added. Entries close March 20 to John L. Lequin, Secretary-Treasurer Interstate Association, 44-48 Cedar street, New York city.

April 14-16.—ATCHISON, Kan.—Airy Lou Hart's third manufacturers' amateur and fourteenth open-to-all tournament.

April 7.—HACKENSACK, N. J.—Third contest for the Recreation cup, under the auspices of the Bergen County Gun Club, Cup contest at 12 noon sharp. C. O Gardner, Sec'y.

April 14-16.—BALTIMORE, Md.—Tournament of the Interstate Association, under the auspices of the Baltimore Shooting Association.

April 15.—YOUNGSTOWN, O.—First tournament of the Pennsylvania and Ohio Border Gun League. Geo H. Jones, Sec'y.

April 15-17.—SAN ANTONIO, Tex.—Tournament of the San Antonio Gun Club. Open to amateurs only. Willard T. Simpson, Chairman Ex. Com.

April 10.—WINDSOR LOCKS, Conn.—All-day tournament of the Windsor Locks Gun Club. Targets. C. F. Cleaveland, Sec'y.

April 20-23.—LINCOLN, Neb.—Twenty-first annual tournament of the Nebraska State Sportsmen's Association. Added money later.

April 21-23.—SAN ANTONIO, Tex.—Second annual meeting and tournament of the Texas State Sportsmen's Association. O. C. Guessaz, Sec'y.

April 27-30.—FONDA, Ia.—Tournament under the management of Geo. E. Hughes and C. R. McCord. Live birds. $800 added money.

April 28-29.—RICHMOND, Va.—Tournament of the Interstate Association, under the auspices of the West End Gun Club.

April 28-29.—PERU, Ind.—Tournament under the management of J. L. Head.

May 5-7.—NEWBURGH, N. Y.—Annual spring tournament of the West Newburgh Gun and Rifle Association. First two days, targets; third day, live birds. $50 average money to three high guns in all programme target events. Open to all.

May 11-13.—PEEKSKILL, N. Y.—Annual tournament of the Peekskill Gun Club. First two days, targets; last day, live birds.

May 12-13.—CONNERSVILLE, Ind.—Tournament of the Connersville Gun Club. Live birds. T. F. Thomas, Sec'y.

May 12-14.—WATERLOO, Ia.—Tournament of the Waterloo Kenne Club. E. B. Walker, Sec'y.

May 17-22.—KANSAS CITY, Mo.—Annual tournament of the Missouri State Game and Fish Protective Association. Fred T. Durrant, Sec'y.

May 18.—ALBANY, N. Y.—Annual spring tournament of the West End Gun Club. Horace B. Derby, Sec'y.

May 19-20.—SAVANNAH, Ga.—Tournament of the Interstate Association under the auspices of the Forest City Gun Club.

May 19-21.—CANTON, S. D.—South Dakota Sportsmen's Association annual. C. S. Seely, Sec'y.

May 20.—GREENVILLE, Pa.—Second tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

May 26-29.—EAST ST. LOUIS, Ill.—Annual tournament of the King's Smokeless Gun Club.

May 31.—CANAJOHARIE, N. Y.—Eastern New York Trap-Shooters League tournament, under the auspices of the Canajoharie Gun Club. Charles Weeks, Sec'y.

June 2-4.—SPRINGFIELD, O.—Annual tournament of the Ohio Trap-Shooters' League, under the auspices of the Springfield Gun Club.

June 8-9.———, ——.—Tournament of the Trap-Shooters' League of Indiana.

June 8-11.—AUBURN, N. Y.—New York State Sportsmen's Association tournament. C. W. Tuttle, Sec'y.

June 9-10.—MONROE, La.—Tournament of the Interstate Association, under the auspices of the Monroe Gun Club.

June 10.—NEWCASTLE, Pa.—Third tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

June 15-18.—CLEVELAND, O.—Fourth annual tournament of the Chamberlin Cartridge and Target Company.

June 16-17.—FARGO, N. D.—Third annual tournament of the North Dakota Sportsmen's Association. Targets. W. W. Smith, Sec'y.

June 22-25.—OIL CITY, Pa.—Seventh annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Oil City Gun Club. Targets and live birds. Black powder barred. Special event: 25 live birds per man, $25, $1,000 guaranteed. Send entries to H. C. Reeser, Sec'y, Oil City, Pa.

July 14-15.—NEW HAVEN, Conn.—Tournament of the Interstate Association, under the auspices of the New Haven Gun Club. Wm. H. Hazel, Sec'y.

July 22.—MEADVILLE, Pa.—Fourth tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

Aug. 4-5.—LEWISTON, Me.—Tournament of the Interstate Association, under the auspices of the Androscoggin Gun Club.

Aug. 19.—WARREN, O.—Fifth tournament of the Pennsylvania and Ohio Border Gun League. Geo. H Jones, Sec'y.

Aug. 25-26.—MONTPELIER, Vt.—Tournament of the Interstate Association, under the auspices of the Montpelier Gun Club.

Sept. 15-16.—PORTSMOUTH, N. H.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club.

Oct. 6-8.—NEWBURGH, N. Y.—Annual fall tournament of the West Newburgh Gun and Rifle Association. First two days, targets; third day, live birds. $50 average money to three high guns in all programme target events. Open to all.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The annual meeting of the Florists' Gun Club, of Philadelphia, Pa., was held on March 2. The *Public Ledger*, of that city, of March 3 gives the following programme for 1897: "The annual meeting of the Florists' Gun Club was held yesterday afternoon at Horticultural Hall. The members present were: Charles D. Ball, A. B. Cartledge, John Burton, George Craig, Thomas C. Brown, John G. Carlisle, George Geoble, William K. Harris, George Anderson, J. William Colflesh, John Westcott and J. K. Starr. The officers elected for the ensuing year were: President, J. W. Colflesh; Vice-President, W. K. Harris; Secretary and Treasurer, A. B. Cartledge; Field Captain, George Anderson. Committee on Grounds: C. D. Ball, A. B. Cartledge and G. Anderson. Entertainment Committee: G. Geoble, Lemuel Ball and John Westcott. Handicap Committee: John D. Carlisle, T. C. Brown and J. K. Starr. The club has purchased two silver cups, which will be contested for at the twelve regular monthly shoots, under a handicap system, 50 targets, 25 known and 25 unknown angles. To qualify for the prizes each marksman must compete in at least ten of the twelve matches. A friend of the organization offered a silver cup, to be competed for once a month, but not on the regular club day. The conditions are the same as for the club cups, with the exception that a marksman winning it three times will become the final owner."

The organization of the gun clubs of Philadelphia, Pa., into a league, under the title of Trap-Shooters' League of Philadelphia, has become an accomplished fact. This is mainly due to the efforts of Mr. J. K. Starr, the secretary of the league, who has worked hard for the end he had in view, viz.: the organization of such a league for the purpose of booming trap-shooting in the City of Brotherly Love. There are 11 clubs in the league, a number that strikes one at once as being head and shoulders over any similar organization. This large membership goes to show that Mr. Starr has the confidence of the members of the different shooting clubs of Philadelphia, and also augurs well for the future success of the league itself. The following clubs are charter members of the new organization: Florists', Independent, Wayne, Frankford, Silver Lake, Forest, Glen Willow, U. of P., Norristown and Southwark. The first shoot of the league was held on Saturday last, March 6, on the grounds of the Florists' Gun Club, Wissinoming Station, P. R. R. The team shoot consists of teams of six men from each club.

Pittsburg, Pa., will have seven representatives in the Grand American Handicap this year. Old Hoss says so, and we never doubt his word. He'll be there, of course. We learn also from the Pittsburg *Commercial Gazette* of the 6th inst. that the Herron Hill Gun Club, of that city, has chartered a special car for its shooters and their guests. Bill McCrickart's coming too.

The Waterloo (Ia.) Gun Club has decided to hold a tournament May 12-14. The following item from the Waterloo *Courier* of Feb. 27, mailed to us by Mr. J. C. Hartman, tells the story: "The meeting of the gun club, held at H. G. Bloeser's tonsorial parlors last evening, was well attended. The club has lost its genial president, Bob Smith, by reason of removal to Mason City, and the meeting was called to order by Vice-Pres. J. C. Hartman, with E. B. Walker as secretary. A vacancy in the office of secretary and treasurer of the club being declared, E. W. Coburn was elected treasurer and E. B. Walker secretary. It was decided to hold a three-days' tournament, Wednesday, Thursday and Friday, May 12, 13 and 14, and the following committees were appointed: On Grounds—Dr. E. R. Shannon, E. W. Coburn, L. Van Vleck; on Live Birds—G. Place, G. Hackett, H. G. Bloeser, C. S. Choate; on Programme and Advertising—E. W. Coburn, J. C. Hartman. The club is anxious to secure permanent grounds, that a substantial club house may be erected and grounds laid out in proper style. This is a matter that has been deferred until the route of the electric railway to Cedar Falls is decided upon, when a site will be selected that will be easy of access from both cities. The grounds most in favor are on the big cut-off, and should the electric line cross the river at the park an effort will be made to buy or lease a few acres of land on this island for the club's use. The coming tournament will be held on the common east of the amphitheater at the Cedar River Park, if these grounds can be secured. As the shoot will be held nearly six weeks in advance of the Chautauqua season, it is thought that the permission of the park authorities can be readily obtained. Three thousand birds will be purchased, and the club hopes to make this the largest and most successful event of the kind ever held in Waterloo. Secretary Walker closed a deal this afternoon with a poultry dealer from Jessup by the name of Bennett for 3,000 live birds, all to be good flyers, to be delivered in Waterloo May 12.

Apropos of Upson's victory at Riverton on Friday last, we may as well tell the following story about him; it's good enough anyway: Upson is a keen shooter, and no one takes more pains than he does to shoot well. As a man at Knoxville in 1895 said of him: "He carries a whole fly-book full of sights with him!" One day last year he missed a target just when he wanted it, and the thought of that lost target haunted him. He woke up one fine morning and lay abed thinking over it. Suddenly he had an inspiration, and, getting out of bed in his night apparel, seized his gun and began pointing it at different objects in the room and out of the window. Now, as it happened, Upson was having the outside of his house painted, and right here's where the trouble began. The painter was climbing up the ladder to go to work, paintpot and brush in hand; he reached the level of Upson's bedroom window just as Upson was throwing the gun to his shoulder, pointing it out of the window at the ghost of that lost target. The sight of a man in his night shirt, pointing a shotgun slap at him, was too much for the painter. He didn't climb down the ladder, he simply fell off, paintpot and all; it was the simplest way after all, and two stories don't amount to much when there's a gun in question, even if it isn't loaded, so long as you don't know that fact. The rest of the story shall be told—by Upson himself.

The Cobweb Gun Club's tournament at Baychester, N. Y., March 16-19, is the next large event on the card for 1897. The first two days will be given up to targets; the last two days to live birds. Shooters should not overlook the fact that this tournament takes place at the same time that the Sportsmen's Exposition is in session, and that while they can spend the days pleasantly at Baychester, the evenings cannot be long, as the Garden will be full of attractions of all kinds for those who like guns, etc. Of course the main event of the tournament will be the Cobweb Handicap, $15, birds extra, $500 guaranteed. This event will be shot on March 19. The average money on the target days should get the boys out early. Two cents for targets and $50 average money shows that the Cobweb Gun Club is not after the shooters' money. All the club asks for is fine weather and plenty of shooters. It will make everything else pleasant. Neaf Apgar will see to the running of the tournament and will keep the squads busy breaking targets.

It is misleading and of no possible use for any newspaper to state that "J. L. Lequin, secretary of the Interstate Association, is receiving numerous entries for the Grand American Handicap." As a matter of fact, the entries to date are few in number, but are at least 800 per cent. greater than they were at the same date last year. Almost all intending competitors always hold off until the last week, and then entries come in with a rush. We believe that when the Sportsmen's Exposition opened last year there were just five entries for the big handicap. In the next six days the list went up to about 105! And we look for more than that number this year. Remember that entries for the Grand American Handicap close on March 20; after that date entries may be made up to the last shot of the second round by paying a penalty entry of $35 instead of $25. Send your entries, accompanied by $10 forfeit, to John L. Lequin, secretary-treasurer, 44 Cedar street, New York, N. Y. Don't forget to send your shooting name as well as the one you sign to your checks.

The Standard Gun Club, of Baltimore, has entered upon the tenth year of its existence. On March 1 last it held its ninth annual meeting in the office of Allen C. Chase, 2 Light street. The following officers have been elected for 1897: President, G. Gent; Vice-President, W. E. Buckbee; Secretary, E. H. Storr; Field Captain, John Devall. Messrs. W. T. Harvey, W. T. Clements and J. W. Eddell, together with the four above-named gentlemen, were chosen to form the board of directors for the club. The question of arranging a series of team races between the Standard Gun Club and other clubs was discussed. Messrs. Harry Ducker, John Devall and E. H. Storr being appointed a committee to arrange such matches. The regular shooting day of the club will be Saturday. Some improvements have been made at the club's grounds at Point Breeze, and the Standard Gun Club starts this year without a debt charged against it, and with its shooting grounds, club house, etc., in good working order.

Will Park wrote the following in last week's issue of *Sporting Life:* "The holder of the target championship of Ohio, the sparrow championship of United States and maker of best record for consecutive breaks on inanimate targets for the year of 1896 was in Philadelphia one day this week. He was not looking for trouble, but said that he would not run out of the way of it if it stood in his path." The party referred to is understood to be Dennis A. Upson, of Cleveland, O. Judging from the work of A. D. Williams (none other than D. A. Upson himself) at Riverton on Friday last, March 5, he was actually hunting trouble, as he didn't do a thing but beat them all out with a score of 94. That he found trouble is also shown by the fact that he retired on the following day at the end of the 86th round of his match with Louis Duryea when 6 birds to the bad. He acknowledged then that his name was Dennis.

Mr. Ledridge, of the *Switch and State Journal*, of Ogden, Utah was kind enough to send us an account of the Utah-Montana team race referred to elsewhere. As our other account was in type, and, as the scores were identical, we merely clip the following from Mr. Ledridge's account: "The Montana team was composed of four of the very best shots in that State: John F. Cowan, holder of the live-bird championship for 1894-5; James Conley, who has held both the live-bird and blue rock championship medals; Mat Wright, present holder of the live-bird championship medal; and D. D. Twohy, present holder of the blue rock championship medal of his State. The Ogden team was made up as follows: G. L. Becker, present holder of the Utah blue rock championship medal; A. P. Bigelow; John M. Browning, of national repute as the inventor of the new rapid-firing gun adopted by the United States navy, called the Peacemaker; and his brother, Matt. Browning."

"Where's Skinner?" said some one to us the other day. "Out West," said we promptly; but that was all we could say. It may have been a case of thought transference, or simply a coincidence, but anyway here's a letter we received Monday afternoon, March 8, from W. H. Skinner himself, the letter being dated from Phœnix, Ariz., March 2: "I am very happy to inform you that I have been connected with the above company (the California Powder Co.) since Jan 1, and have done very nicely for them. The company is one of the best on the Coast, or anywhere else. After working the Coast thoroughly I am coming East, and will see you and all the boys this summer. Our specialties are the 'C. P. A.' smokeless, for shotguns, and the 'Peyton Military Smokeless,' for all high power rifles." Now we know where Skinner is.

The following is from the Galveston, Tex., *News* of Feb 24: "After a prolonged lull in trap-shooting at Hanley's Park it will be revived and pushed with renewed vigor for the balance of the year. Some of the most active sportsmen have been out of the city for several weeks, which has made the attendance at the last shoots quite small; but the sportsmen have returned now, and a shoot has been arranged for to-day, which no doubt will be well attended. There is a movement on foot now toward the successful organization of a gun club. There is little doubt of the scheme being pushed to a successful termination, in which event the club will give a tournament at their grounds, which have been conceded by all who have seen them to be the best and finest equipped in the State, and excelled by few clubs in any State. Shooting will be commenced at 2 P. M. sharp."

The Utah team, composed of the "Four Bs," A. P. Bigelow, G. L. Becker, J. M. and M. S. Browning, can congratulate itself upon its great team total in its recent match with the Montana team. Scores of 95, 94, 93 and 90, making altogether a total of 372 out of 400, an average for the team of 93 per cent., makes what we believe to be a new record for team shooting at 100 birds per man, four-men teams. FOREST AND STREAM has to thank Mr. E. J. Ives, of Ogden, Utah, for the interesting account of this shoot which appears in this issue.

One of the New York dailies on Sunday morning last gave a description of the Duryea-Upson match on March 6 that reflected seriously upon Mr. Duryea's character. The account stated that he purposely missed birds for reasons which, if true, would class him with the skin-game pigeon-shooter, a class, fortunately for the sport, that is becoming rarer every day. To defend Mr. Duryea's reputation from the reflections cast upon it would be a work of supererogation, so far as Mr. Duryea's friends and those who know him are concerned. For the information of those who do not know him, however, we have not the slightest hesitation in classing the statements referred to as falsehoods of the rottenest description.

Among the twenty-three entries for the Grand American Handicap received by Secretary-Treasurer Lequin to date are the names of twelve Western shooters, who are coming East in a body under the guardianship of Mr. E. S. Rice, the popular representative of the Du Pont and Hazard powder companies in the West. One-half of this contingent will represent the Du Pont Co., the other half the Hazard Co. This friendly invasion should be a cause for warm congratulation on the part of the Eastern shooters; it is safe to prophecy that when Mr. Rice and his friends leave us they will feel that they have been at least the guests of men who know how to appreciate pluck, energy and skill (for they'll be skillful).

The following is from a New York daily of March 1: "By the way, the chappies who fought it out over the traps of the Larchmont Y. C. Saturday did not all abandon the foolish notion of not shooting in their own names, as had been promised for them. Joseph Palmer Knapp's gun name is still Joseph K. Palmer, and some of the others retain their *soubriquets*. The old idea that a gentleman must have a *nom de guerre* for every move he makes in sport was exploded long ago. In these days of enlightenment the theory is that a gentleman shouldn't do anything he would be ashamed of. If he can't do it in his own name he oughtn't to do it at all." We have yet to learn that a *nom de guerre*, *nom de plume* or "*nom de fusil*," adopted by any one, necessarily means that that party is ashamed of what he is doing. Simply saying that it does is no proof of the fact.

Tom Keller is back again in the city, and will be round about Broadway for the next month. He has his own tale to tell about the horrors of cold weather at San Antonio, but is not carrying about with him any kicks on other accounts, particularly in a business way. Milt Lindsley, he says, is so busy that he can't get into mischief, being at the factory about twelve hours per day. (Note—The 4:30 train from King's Mills has been taken off, so Mi't has to stay at the office or freeze to death until about 8 o'clock.) Keller also reports that he will make one in the list of entries for the Grand American Handicap, and trusts that this early declaration will not keep out many entries.

The management of the Carteret Gun Club has long contemplated moving house to other and more desirable quarters than its present location on the eastern shore of Newark Bay at Bergen Point (now Bayonne), N. J. Owing to the houses to the eastward of the grounds, the traps had to face about northwest, thus bringing the prevailing winter wind right in the faces of shooters at the score, and also causing trouble when a shooter drew a left-quartering driver late in the day, on account of the sun shining right in his eyes. It is now given out that the club will move to a convenient location on Long Island within a comparatively short space of time.

We learn that during the 100-bird race at the Riverton Gun Club's grounds on March 5 Mr. Dando, of the home club, had the misfortune to have his gun burst in his hands when firing at his 48th bird. The gun, we are told, was a Smith, but in the absence of any positive information as to how the gun burst, why it burst, what powder and how much was being used, it is manifestly unfair to lay the blame on the gun. A slight obstruction in the barrel often causes a gun to burst; but it is generally the gun that is to blame, if you listen to what people say about it.

There was a curious feature in the 10-bird sweep for a cup at Riverton on Saturday last, March 6. Morris, who received an allowance in the 10 birds of 2 misses as kills, was the only one to score a highest possible; he missed his 6th bird, but his allowance gave him a straight 10. Capt Money, Lou's Duryea, D. A. Upson, R. A Welch, T. S. Dando and J. H. Davis all tied on 9 each. Finletter lost 2 birds out of his first 5 and withdrew. George McAlpin missed 3 out of his first 5 and dropped out in the 8th round. Phil Daly, Jr., lost 2 out of 8 and retired. Hot company, and not a 10 straight among them!

The Worcester, Mass., Sportsmen's Club held its annual meeting, banquet and election of officers on Wednesday evening, March 3. During the evening President M. P. Roach presented W. L. Davis with a diamond scarfpin as a souvenir of his having held the L. C. Smith trophy during the season. The election of officers resulted in the unanimous choice of the old board, as follows: President, Maynard P. Roach; First Vice-President, John T. Mascroft; Second Vice-President, R. W. Walls; Treasurer, Frank M. Harris; Secretary, V. D. Kennerson; Executive Committee: the officers and Fred. Bucklin, A. W. Walls, E. W. Ide, George M. McLellan.

We had not met W. N. Drake, of the Maplewood, N. J., Gun Club, for many months until last week. Billy says that he has been too busy to do any trap-shooting, but adds that the South Orange Field Club has started trap-shooting again, and has some capital grounds for the purpose. Drake is just now booming an excellent style of hat for trap-shooting in warm, sunny weather, the hat being made by the firm of E. V. Connett & Co., of Orange Valley, N. J., with which firm he has been connected for some time.

J. Hildreth, one of the Southern States representatives of the Winchester Repeating Arms Company, informs us that Mr. Faurote, the well-known Texas trap shot, has entered into partnership in the gun business, and will open up a gun store at Greenville, Texas.

The Sandusky (O.) Gun Club will hold a tournament at targets, sparrows and pigeons on March 16-17. In the target events bluerocks will be thrown from a magautrap. Some of the target events are open to amateurs only, but the majority are "free to all."

A party of New York shooters will visit Peekskill, N. Y., early in April to spend the day at Peekskill as the guests of the home club. The "Up-the-Hudson" boys are never backward at "go'ng visiting," so it is only fit and proper that the compliment should be returned occasionally.

Ferd Van Dyke has been shooting a rifle so much of late that he has scarcely gotten back into his old-time form at targets. He made a mistake, too, and acknowledged it, when he tried to break targets on Wednesday, March 3, with a live-bird load.

The Elkwood Park traps are growing in popularity daily (no pun). The facilities for rapid work in running off events, with a choice of three grounds to insure a "straightaway" wind, naturally attract shooters.

Wm. Renick, of Detroit, Mich., who won the Washington trophy at the annual shoot of the Pastime Gun Club, of Detroit, the other day, used a Smith gun, King's Smokeless and Peters's cartridges.

Don't forget that it costs just $10 more to shoot in the Grand American Handicap if you fail to enter on or before March 20.

MARCH 9. EDWARD BANKS.

Sherburne Gun Club.

SHERBURNE, N. Y., Feb. 23.—I have been taking your paper for two years, and as I am a member of the Sherburne Gun Club, I thought I would send you the scores made at Lake Earlulle to-day by our club. No. 3, the handicap event, was at 15 targets, the number of breaks being added to each man's handicap points. Miller, of Earlulle, won the cup by 1 point. Scores:

No. 1, 10 targets: Burlison 8, Dalrymple and Partridge 6, Hartwell 5, Miller 4, Bemis 0.

No. 2, same: George 9, Reynolds 8, Wilcox and Burlison 7, Shepardson 6, Miller and Stanton 4, Jackson 1.

No. 3, Handicap:

Miller (14)	1111110110C0111—	11+	14—25

H. T. MACKEY.

Utah vs. Montana.

A NEW RECORD IN TEAM SHOOTING.

OGDEN, Utah, Feb. 23.—An almost perfect day greeted the contestants as they faced the traps in the much-talked-of interstate match, for a purse of $800, between the Utah and Montana teams of four men each, which was finished to-day at the half mile race course, Ogden, Utah. Fairly good weather prevailed during the contest. The conditions were 100 live pigeons each at 28yds. rise, 5 ground traps, American Shooting Association rules.

As the match progressed it became apparent to all that the Montana men had undertaken a large sized contract, as the Utonians were shooting in great form. At the close of the first day the score stood: Utah 189, Montana 176, each team having shot at 200 birds; Utah thus having a lead that was almost too great to overcome. When the sportsmen from the Land of Copper entered on the last half of the match it was clearly written that they were outclassed, and that they would return to their Northern homes without the scalps of the Utes dangling in their belts. It is a satisfaction to the Montana delegation to know that they were shooting a score that should win under ordinary circumstances, but that the Utah men were putting up a mark that was almost phenomenal in team shooting. The birds were a very fair lot.

The guns used were as follows: A. P. Bigelow, Smith ejector; G. L. Becker, J. M. and M. S. Browning, Winchester repeaters; M. Wright and D. D. Twohy, Greener ejectors; John F. Cowan, Scott ejector; and James Conley, Smith hammerless (10 gauge), at 30yds. rise. All used Du Pont Smokeless, except Wright, who shot S. S.

Messrs. Browning Bros. used the late model Winchester repeater, which is a product of their ingenuity, and from an examination of their score it will be seen that they not only have the genius to invent, but that they are also consummate masters of the product of their invention. The gun used by Gus Becker attracted considerable attention and comment (not favorable, however, as it is not a thing of beauty), the gun in question being one of the ordinary grade Winchester lever action (also Browning's patent) and very much worse for wear, but it did not seem to bother Gus much to run up a score of 95 out of 100, which goes to show that a cheap gun will shoot very straight if held right.

Below is the score in detail:

Montana Team.

John F Cowan	2222•2222 02 2•222?•222 8—22

A P Bigelow	28	23	22	16	11
M S Browning	21	15	19	25	20
G L Becker	25	24	21	18	12

Below is a table showing concisely the flight of the birds drawn by each shooter, and also showing the proportion of each kind of bird such shooters missed. It will be noted that the draw was really remarkably even as a whole, taking team for team. Outgoers were quite numerous, the Montana team having 235 out of their 400 of that class; the Utonians drew the same number of the same kind. Thus 470 out of the 800 trapped in this match were outgoers; incomers were 123 altogether; the rest were 157 right quarterers and 50 left-quarterers. Table follows:

FLIGHT OF BIRDS.

Trap Around Buffalo.

BISON GUN CLUB.

BUFFALO, N. Y., Feb. 26.—The Bison Gun Club held a shoot to-day at the Walden avenue grounds. The attendance was not as might have been expected had the event been more fully advertised. The special match between F. D. Wheeler and George D. Cooper at 25 sparrows per man, $25 a side, was won by Wheeler, who scored 24 to Cooper's 22. Other events shot were as below, Nos. 1, 4 and 5 being at 10 sparrows; Nos. 2 and 3 at 10 and 5 sparrows respectively:

Events:	1	2	3	4	5	Events:	1	2	3	4	5

Who is Paradise Lost?

UTICA, N. Y., Feb 25.—*Editor Forest and Stream*: Just read your answer to Paradise Lost. Put her there, old boy. That is good, sound reasoning; you hit the nail square on the head. It goes to prove what I said long ago, that the trap editor of FOREST AND STREAM is the right man in the right place. E. D. FULFORD.

BUFFALO, N. Y., March 5.—*Editor Forest and Stream:* I have just read your issue of the current week, and have scanned the trap columns with rather more than my usual eagerness, because I thought I should find in them some apology from Paradise Lost, of Worcester, Mass., for that letter of his which you printed in the issue of Feb. 27. Am much disappointed in consequence at not finding any such reply. Who is Paradise Lost anyway? You handled him all right, but you kept your gloves on when you did it. Such men should be handled without any gloves, as they do harm to trap-shooting while professing to be working in its interests. 48 GRAINS.

Mountain State Gun Club's Tournament.

PARKERSBURG, W. Va., Feb. 23.—The Mountain State Gun Club, of this city, is destined to make a mark for itself, if a large membership composed of wealthy, gentlemanly, enthusiastic and first-class shots count for anything. This club has just been reorganized upon a thoroughly business and active basis. The present list of members is composed of sportsmen of influence and determination, who, possessing the means, are not to be deterred from carrying out any plan they formulate.

The opening shoot for 1897 was held on Washington's Birthday. It was the intention of those having the matter in charge to simply give a little club shoot, and as it had been raining steadily for days prior to yesterday, and as the flood was at such a stage that travel was almost at a stand till, it was not thought possible that any outsiders would be present. Judge the management's surprise when the following gentlemen arrived and registered at the hotels: H. E. Norton, of Ironton, O., representing the Winchester Repeating Arms Co.; R. S. Waddell, of Cincinnati, General Agent Du Pont and Hazard Powder companies for the Central and Southern States; J. H. Mackie, of Cincinnati, representing the Peters Cartridge and King Powder companies; Ralph L. Trimble, of Covington, Ky., who so ably represents and looks after the interests of the trap-shooting departments of the Du Pont and Hazard Powder companies; W. L. Colville, of Batavia, N. Y., representing Gold Dust powder, was present for a short time to day. Other visitors present were Capt. A. W. West, Portsmouth, O.; P. Schlicker and S. Beer, of Marietta, O.; W. L. Gorham and E. O. Bowers, of Sistersville, W. Va.; J. E. Wright, of Wheeling, W. Va., and H. R. Nye, of Sharon, Pa. Had the weather been at all favorable some fifteen or twenty others would probably have been present.

The opening day (yesterday) broke cold and clear. At 8:30 A. M. the shooters were conveyed to the grounds, which are located on an eminence just back of town. It was a surprise to the visitors to note the general excellence of the club's grounds, and the completeness with which every requirement had been met as to screens, electric pulls, board walks, seats, a commodious club house, a warm dinner and other things necessary to their comfort, all of which tends to make trap-shooting an ideal sport. About noon it again commenced to rain so hard that the programme was finished by contestants shooting from under the club house eaves, which are built low and stand about 20yds. from the traps. With this handicap it was almost impossible to do creditable work; however, all events were finished, Trimble winning first average, closely followed by Wright and Mallory. Of the twenty-three men who took part in the programme events twenty used Du Pont Smokeless loaded in the Leader shell, and of the other three two used Du Pont powder in the Smokeless case.

By the unanimous consent of all present the shoot was continued to-day, and everyone congratulated himself on staying for to-day's programme. They were agreeably surprised by the management, who informed them before leaving that in a short time the Mountain State Gun Club would claim dates for a tournament in which sufficient cash would be added to draw all the shooters of prominence. Following are the scores as furnished me by Leon J. Epstein, the club's popular secretary:

Scores of Feb. 22.

LESTER.

The Clover-Leaf Field.

CHICAGO, Ill., Feb. 27.—Last week I had occasion to make comment upon the Clover-Leaf Field idea, which it seems was put in use for the first time last fall at Elkwood Park, N. J. I mentioned the fact that the use of the idea seemed to be subsequent to the publication in FOREST AND STREAM of Mr. W. L. Wells's design, although of course I did not claim that the idea was taken from that design. To day I am in receipt of a copy of *Sporting Life* of Sept. 5, which says: "The clover-leaf field idea of arranging a ground for live-bird shooting so that three sets of traps can be used in small space is over three years old to members of the Riverton Gun Club, of Philadelphia. About three years ago Mr. J. E. Soule, a member of the Riverton Gun Club, of Philadelphia, had an idea of the clover leaf plan of arranging traps and had a splendid colored drawing made of the spacious grounds of the Riverton Gun Club, showing the arrangements of traps the same as Brother Hough has explained in his paper. The Riverton grounds are large enough for four sets, and could be connected with the main club house by an underground tunnel, although three sets will be enough to accommodate the members. This drawing has been hanging in the club house at Riverton for over three years. New ideas in trap-shooting are good things, but we supposed that the clover-leaf field was well known to most trap-shooters. The Riverton Gun Club has long had this idea under discussion, and had it not been for certain reasons would have used this plan three years ago, and if we are not very much mistaken they will use it before any other club in this country, as they have plenty of ground (over thirty acres) and are the leading live-pigeon shooting club in the United States. The clover-leaf field idea belongs to Mr. J. E. Soule, of the Riverton Gun Club, of Philadelphia."

I am glad to note the above comment, which has not earlier been called to my attention. It is in a way interesting, and adds a little news to the question of the clover-leaf field, but it is by no means ultimate or conclusive. The fact that the clover-leaf design hung in the Riverton club house does not constitute proof of publication. As a matter of fact, FOREST AND STREAM did publish it first. It has sort of formed a habit of doing that kind of thing. This I say with proper apologies.

But this is not what I was about to get at. To use a figurative expression, I observe the raise that *Sporting Life* makes of three years, and raise it back about three years better. When it comes to a matter of unpublished discovery of the clover-leaf field, Chicago still has slightly the best of it, though I did not know this until to-day, or the matter would have been published before this. I think that the columns of FOREST AND STREAM of some five or six years ago will show that about that time the sportsmen of Chicago were figuring on establishing a big shooting park out on the Chicago, Burlington & Quincy Railroad. Mr. P. S. Eustis, general passenger agent of that road, was interested in the project and it attracted a great deal of interest at the time.

Mr. W. L. Wells, the author of the clover-leaf design published in FOREST AND STREAM, was a member of one of the committees which made the investigation of the grounds. At that time he formulated this idea of the clover-leaf field for this big new park, and he spoke of this to Mr. R. B. Organ, Mr. W. P. Mussey and other prominent shooters. He also made a rough sketch of the design, and this sketch he to-day possesses.

Of course I do not wish to accuse Mr. J. E. Soule of plagiarism or anything of the kind. The idea was open to all, and could have been used by any one who learned of it. It is very possible that Mr. Soule never heard of it and evolved it from his own consciousness, just as Mr. Wells did. There may be something in this thought-wave or telepathy business. Mr. Soule may have unconsciously absorbed this idea in Chicago. He does not seem to have absorbed it before he came here. I cannot say positively whether his visit here was before or after this shooting park agitation in Chicago, but am of the impression that the columns of FOREST AND STREAM will show that he was here about that time or a little after it. On one point I am very clear: Mr. Wells thought out the idea himself and had no suggestion of it from any one else, for he so told me to-day. Of course my own interest in the matter is simply a news interest, as the idea is not mine in any sense of the word. E. HOUGH.

Boston Gun Club.

WELLINGTON, Mass., March 3.—Though this afternoon turned up gloomy and wet, evidently fourteen trap-shooting devotees were undismayed at the prospects, for the 1:45 and 2:45 P. M. trains unburdened themselves to that extent, and shooting was continued up till 5 o'clock, when it began to pour in earnest. To add to the amusement, one of the fourteen appeared with a gun suitable for celebrating the President's inauguration, only as luck would have it, the time was a day too soon. The 5drs. of black powder made itself both seen, heard and felt, for the weather was exactly right to show up the disadvantages of black powder; and the boom in comparison to the 2¾ or 3drs. of nitro was terrific. Yet the user of some four-year-old ammunition stuck manfully to his task, and though not succeeding so well as with his regulation load of smokeless evidently enjoyed the sensation he created among the more peaceable and quiet nitro advocates.

Spencer was again high on the match. Straights were made by Miskay, Spencer, Gordon and Paine.

Events:	1	2	3	4	5	6	7	8	9	10	11	12

Trap-Shooters' League of Indiana.

INDIANAPOLIS, March 5.—The organization of the Trap-Shooters' League of Indiana has progressed far enough to be an assured success. The purpose of the league is to promote and elevate trap-shooting, and to bring about closer relations between the gun clubs of the State of Indiana.

The officers of the association are as follows: President, E. H. Tripp, Limited Gun Club, Indianapolis, Ind.; Vice-President, D. A. Meyers, Greensburg Gun Club, Greensburg, Ind.; Secretary-Treasurer, H. T. Hearsey, Limited Gun Club, Indianapolis, Ind. Executive Committee: Royal Robinson, Limited Gun Club, Indianapolis, Ind.; C. L. Bender, Muncie Gun Club, Muncie, Ind.; J. E. Sherwood, Bedford Gun Club, Bedford, Ind.; A. Livenguth, Lafayette Gun Club, Lafayette, Ind.; Frank Smith, Brookville Gun Club, Brookville, Ind.

The first annual tournament of the league will be held June 8–9, at a place yet to be named by a vote of the clubs. Please mention these dates in your paper among coming events.

In conclusion I beg to say that as secretary of this league I shall be very much pleased to hear from the different gun clubs throughout the State of Indiana. Our constitution and by-laws will be ready within a few days and I shall be pleased to send the same to any club in our State, or to any of our friends on the outside.

H. T. HEARSEY, Sec'y Trap Shooters' League of Indiana.

Cobweb Gun Club.

NEW YORK, March 4.—The weather to-day was perfect for live-bird shooting, and the attendance at the Cobweb Gun Club's grounds, Bayrchester, was large in consequence. The winners in their respective classes were: Class A, M. B. McDonnell; Class B, Charles Donnelly; Class C, Charles Ditmar.

We have received quite a number of advance entries for the Cobweb handicap, March 19, 15 birds, $15, $500 guaranteed, birds extra; among the list of entries is the name of E. D. Fulford. Programmes will be mailed on application to the secretary, George W. Thompson, Jr., Cobweb Club, 2277 Third avenue, New York city.

To-day's scores follow:

Class A, 30yds. Ties at 3 birds:					
M B McDonnell	22222—5	112	F A Kerker	21102—4	
F Hendrick	22112—5	02	C Zorn	1202•—3	
P F McKeon	11110—4		E Miller	2011w	
Class B, 28yds.:					
Chas Donnelly	21111—5	122	Wm Cashan	22212—5	1•1
Class C, 27yds.:					
Chas Ditmar	10022—3	222	G Thompson	20000—1

G O Barker	02202—3	0•			

GEO. W. THOMPSON, JR., Sec'y.

Pawtuxet Gun Club.

PAWTUXET, R. I., Feb. 27.—The scores given below were made to-day by members of the Pawtuxet Gun Club, who indulged in a little practice at the trap. A good illustration of what practice will do in this way can be seen in the scores made by Mr. Root, who is a beginner, never having shot at the trap before a month ago, and who has shot very little in the field. Mr. Root is a new member of the C. F. Pope Gun Company. The scores made were as below:

W H Sheldon	1111111111111111111111111—25
F Arnold	1111101110111011100111111—20

	1101011100110111010111 —14

J. R. Sheldon, the seven-year-old son of W. H. Sheldon, made the following scores, using a .44cal. shotgun, the targets being thrown by hand:

Twenty-five singles	1111110111111011111111111—23
Five pairs	11 10 11 11 11— 9

PAWTUXET.

IN NEW JERSEY.

AT ELKWOOD PARK.

Feb. 27.—To-day's programme called out a good attendance at the Elkwood Park traps. Among those present were Irby Bennett and Ferd Van Dyke, of the Winchester Repeating Arms Co.; Frank Class and James Timmons, of Morristown, N. J.; A. L. Ivins, Hank White, Joe Baker, T. W. Morfey, of Paterson, etc. Ferd Van Dyke ran 23 straight before losing a bird, and during the afternoon scored altogether 29 out of 31 shot at. He was the only one to score 15 straight in the main event, No. 4, the Avenel handicap, 15 birds, $12, birds included. Ivins started badly, losing 5 out of the 15 shot at in the handicap; he then pulled himself together and shot in something like his old form, scoring 17 straight in the last two miss-and outs. Morfey shot well, but was unlucky, losing his birds at the wrong time. Class scored 32 out of 37 shot at. Scores in all events (everything being $5 miss-and-outs except No. 4) were:

	No. 1.	No. 2.	No. 3.	No. 4.
T W Morfey (29)	2?2	.....	220	2222120212222?23—14

March 3.—L. T. Duryea and H. B. Gilbert, both members of the Larchmont Club, New York, shot a 100-bird race on the new grounds at Elkwood Park to day. Gilbert practically lost the match in the first 25, when he could do no better than score 18 to Duryea's 21, being thus 3 birds behind. In the next 75 rounds they scored 68 to 67 in favor of Duryea. Scores were:

L T Duryea (31)	1122?02021202221221210222—21
	22?222?212211222312?11120—24

H B Gilbert (31)	0122220221202202220?10?220—18
	22?2222?222222222?2?202222—24
	1200121022221112202?21222—21
	?0?20?222?202222211122?211—22—85

March 4.—To-day the main attraction was the McKinley Handicap. In this event Daly was the winner. Scores were:

McKinley Handicap, 12 birds:

J Daly, Jr (28) ....221022122122—11 T W Morfey (29)...021121221020— 9
J G Knowlton (28)222022222?2022—10

Miss-and-outs, $5 each, were shot as follows:

Events:	1	2	3	4	5	6	7	8	9	10
Morfey	2	3	5	4	0	4	4	7	5	3
Daly	2	5	4	4	3	3	3	1	4	..
Knowlton	1	5	1	5	3	1	3	7	4	2
Conklin	1	4	..	..	1	..	..	5	..	..
Price	..	..	..	..	2	4	4	..	..	..

March 6.—The attendance at Elkwood Park to-day was not as large as might have been expected. A good list of events, however, was shot off, Walters doing the best work, scoring 22 out of 24 shot at. Scores were:

	No. 1.	No. 2.
Hyland (30)	2121222111222122110012122—22	002?221220—7

C. H. FRAPWELL, Sec'y.

ANNIE OAKLEY DEFEATS FRANK KLEINZ.

Feb. 27.—Below are the scores made to-day in the 50-bird match between Miss Annie Oakley and Frank Kleinz, of Philadelphia. Miss Oakley won by 1 bird. The birds were too much for the shooters, being a very fast lot indeed. About 300 people were present to see the match:

Annie Oakley	2222•?1•2?01•102220222022—18
	000121•?002222212212?•122—18—36
Frank Kleinz	2120010?2222221•022201021—18
	10020?21•012?022002222112—17—35

Note.—The above score was received too late for our issue of March 6. In mailing it to us Charlie Zwirlein says (speaking of the quality of the birds): "I would like to see some of the cracks from Carteret and Larchmont come up on March 4 and try some of the birds."

BERGEN COUNTY GUN CLUB.

March 3.—The Bergen County Gun Club, of Hackensack, announced a 100-target event for to-day's programme. The conditions were: 100 targets, unknown angles, extra allowance of targets to shoot at, $2 entrance, targets extra at 1 cent each, four moneys, Rose system; optional sweep of 50 cents on each 25 targets. That the conditions were popular is fully proved by the fact that fifteen shooters took part in the event, although the weather was far from promising. A fog, accompanied in the morning by a slight rain, hung over the Hackensack meadows and made the prospect as gloomy as possible. When the main event was about half over a strong but fitful wind sprang up and played havoc with scores. At times it was quite impossible to gauge the flight of the targets accurately, the bad light making it harder shooting than usual.

The position of Capt. A. W. Money at the close of the race was decidedly popular, and was well deserved, the Captain having spoiled a straight in the first 25 by losing his last target, and running 25 straight (the only one made) in his third string. With the aid of their handicaps eight out of those in for money drew down money out of the purse, quite a good showing notwithstanding the erratic shooting of some of the men. The handicaps were awarded by Messrs. Pentz and Horton, the latter the club's hard-working captain. Their figures were based upon a man's supposed percentage, and enough targets were added to be shot at to permit of his running up to 100, the highest possible of course, provided he shot up to his form. We recommend this style of handicapping in preference to any other, for the reason that it gives more men a chance to get in for money and take down something than any other system, but it would be totally inapplicable under any system for dividing purses other than the Rose system or the Equitable system. It might do if the conditions were "high guns," but altogether we nail our colors to the mast for the Rose system in all similar events.

The hustling work for this shoot was done as usual by E. G. Horton, aided by Van Keuren; C. E. Dawson, of course, was the referee, and time and again his best eyes were needed to see "small pieces" in the bad light. The fumes, too, from the gunpowder were annoying to the throat, the fog causing what little smoke there was to hang around the platform; hence Dawson's voice at the finish was not what it was at the start. The traps worked well, there being really very little breaking. The Bergen County Club has a capital set of trapper boys, who seem to enjoy their work, and who do it well and quickly. An electric bell from each trap gives warning at the score immediately a trap is ready after a broken target has been thrown and refused. The conveniences of this appliance, and the saving in lung power, are so great that it is strange more clubs do not install a similar system. The free lunch served by the club was, as usual, good and highly appreciated.

Among the shooters were P. H. Mason and Harry P. Dain, who had come down from Peekskill, N. Y., to take part in this shoot. Others present were Capt. A. W. Money, of the American E. C. Powder Co.; Ed. Taylor, of the Laflin & Rand W-A Powder Co.; Gus E. Greiff, of Von Lengerke & Detmold, the United States agents for Schultze powder; J. Hildreth and Ferd Van Dyke, of the Winchester Repeating Arms Co.; Neaf Apgar, shooting Austin powder; F. Sinnock, the holder of the *Recreation* cup, which he won on these grounds with a score of 94 on Feb 10 last; C. C. Hebbard, whose name is best known in connection with the Empire Target Co., although he is now keeping house at 310 Broadway, and sells L. C. Smith guns under Fred Quimby's instructions; Chris Wright, a rattling good live-bird shot, who hails from Paterson, N. J.; W. M. Smith, of the South Side and Forester gun clubs, of Newark; Van Keuren and J. H. Blauvelt, both members of the home club.

As stated above, Capt. Money won first place; his score, including his allowance, was 98. Close after him came Edwards (practically the scratch man) and Charlie Hebbard, tied for second place on 97; Neaf Apgar and Ferd Van Dyke tied for third on 94 each; fourth place was filled by Ed. Taylor, P. H. Mason and H. P. Dain with 93 each. Eleven of the entries went into the optional sweeps on each 25. These sweeps resulted thus:

First 25: Money first with 24, Edwards and Sinnock second with 22, Apgar third with 21.

Second 25: Edwards and Sinnock first with 24, Apgar and Mason second with 22, Van Dyke, Money and Dain third with 21.

Third 25: Money first with 25, Edwards second with 24, Van Dyke third with 22.

Fourth 25: Apgar and Taylor first with 22, Van Dyke and Wright second with 21, Edwards, Sinnock, Greiff, Mason and Dain third with 20.

The purses in the optionals were all divided under the Rose system. It will be noticed that in the fourth 25 nine out of the eleven in the sweep drew money.

In addition to the 100-target event several 10 and 15-target events were shot, somewhere in the neighborhood of 3,000 targets (bluerocks) being thrown during the day. Scores in the handicap event follow:

Capt Money, (12)	1111111111111111111111111101011111111110111110111101	—45

* Blauvelt did not shoot his handicap. EDWARD BANKS.

WESTFIELD GUN CLUB.

March 4.—A new club was organized recently at Westfield, N. J., with a list of thirty-three members. The following are the officers of the new club: President, C. P. Wilcox; Vice-President, N. C. Sears; Secretary, G. W. Peek; Treasurer and Captain, W. H. Chamberlin. The club has not yet gotten its grounds, but will shortly have some as good as any in the State. The membership roll contains the names of men who have joined it with the intention of carrying out its objects, viz., for the purposes of encouraging trap-shooting and aiding in the better protection of the fish and game of the State of New Jersey.

A small practice shoot was had to-day, the following scores being made at 25 targets per man: W. H. Chamberlin 20, C. P. Wilcox 19, Chas. Burtis 12, W. Burtis 7, G. W. Peek, Jr. (only shot at 15) 10.

BOILING SPRINGS GUN CLUB SHOOT.

March 6.—The regular monthly club shoot of the Boiling Springs Gun Club, of Rutherford, N. J., was held this afternoon in dull weather. Notwithstanding the gloomy nature of the sky and the raw dampness of the wind 25 shooters took part in the club cup shoot, 21 out of the 25 being members of the club. Among the guests were Ed Taylor, of the Laflin & Rand W-A Powder Co.; J. Hildreth, of the Winchester Repeating Arms Co.; J. A. Banta and Capt. E. G. Horton, of the Bergen County Gun Club, of Hackensack.

The club shoot is at 50 targets, 25 at known angles and 25 at unknown angles, allowance of extra targets to shoot at, the allowance being shot at unknown angles. Dr. De Wolfe, who has of late been striking a gait that is hard to beat when he has any allowance, won the cup with 47 out of 55 shot at, a good score under almost any conditions. Close behind him were four scratch men: Edwards 46, Van Dyke 45, Apgar and Greiff 44 each. Scores were:

Cup shoot, handicap allowance of extra targets:

Dr De Wolfe (5)	11111101111110111011111011111101011111111111011111	—43

Hartman	0100000001101010010111011	—12

* Guests.

Broshart did not shoot his handicap allowance. James only shot at 25 known angles, having to leave on business; Hartman took his place and shot at the 25 unknown angles, this being his first essay at bluerocks.

Before lunch, and while waiting for the same to be gotten ready, Van Dyke and Edwards shot a little race at 15 experts and 5 pairs. Van won easily, taking lunch as his opponent's guest. Scores follow:

Van Dyke	111111111111111	11 11 11 11 10—24
Edwards	101111111110010	00 10 10 11 10—16

EDWARD BANKS.

Dutchy Smith's absence from the Jersey traps has been sorely felt for some months. Dutchy has been very ill indeed, but is now looking and feeling very much as usual. He has lost a little weight, we understand, some 30lbs or so, but that is causing him no anxiety, for, as he says: "Soon I get me some plenty, then maybe I give you some neither!" All of which means that he'll soon be smashing targets as usual and taking all the money.

Riverton Gun Club.

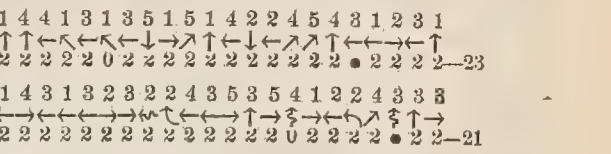
PHILADELPHIA, Pa., March 5.—Eight entries were obtained for the Riverton Gun Club's 100 bird race to day on the club's grounds at Riverton, N. J. Although J. P. Knapp, George Work and Fred Hoey were absent, as well as C. A. Macalester, the quality of the shooters ranked quite highly. Among the number were G. S. McAlpin and L. T. Duryea, from New York; D. A. Upson, from Cleveland, O.; T. S. Dando, Count Langen, L. Finletter, R. A. Welch and R. Toland, all hailing from Philadelphia.

Welch and Count Langen started off strongly, and at one time it looked as if Welch was going to duplicate his victory at Larchmont. He could, however, do no better than tie Duryea and Cleland for second money on 94. McAlpin lost his 99th bird, throwing him out of the money. The winner was rather a surprise party for the club men, D. A. Upson, of Cleveland, running out with 94 to his credit, scoring 47 out of each 50. Finletter finished very strongly indeed, scoring 54 out of the last 57 shot at, his 3 lost birds falling dead out of bounds.

The match was shot on two sets of traps, the "old grounds" and the "river grounds." The eight entries were divided into two squads of four each, one-half going to the "old grounds," the other half to the "river grounds." Thus Upson, Welch, Dando and McAlpin shot their first 50 birds on the "old grounds," Duryea, Langen, Finletter and Toland shooting their first 50 on the "river grounds." When the match was half over, the squads changed places. Judging from the scores there does not seem to be as much difference between the two grounds as is generally supposed. Below is a table showing the birds scored on both sets of traps:

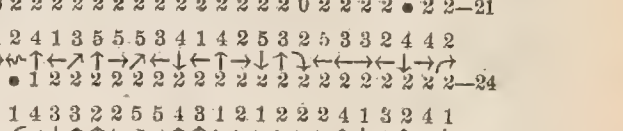
	Old Grounds.	River Grounds.		Old Grounds.	River Grounds.
Upson	47	47	Toland	44	44
Welch	47	45	Langen	40	46
Duryea	47	45	Dando	43	43
Finletter	48	44		——	——
McAlpin	46	45		362	359

An analysis of the above figures shows, however, that on the "old grounds" every shooter save one (Count Langen) either beat or equaled his score on the "river grounds." The claim of the members of the Riverton Gun Club that the "new" or "river grounds" are the harder of the two seems to be well founded.

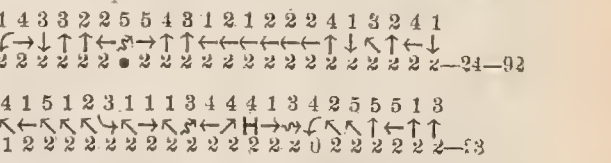


Scores in detail show flight of bird, number of trap as pulled, and result of each shot, as follows:

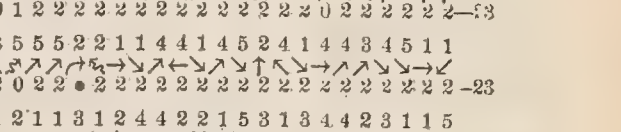
Trap score type—Copyright, 1897, by Forest and Stream Publishing Co.



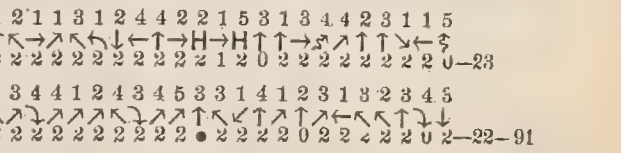
D A Upson (29).



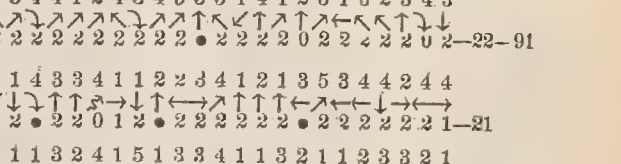
R A Welch (30).



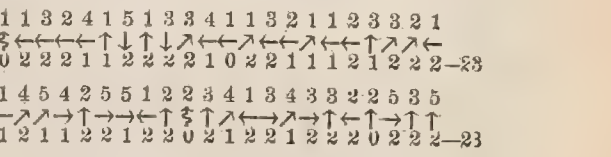
L T Duryea (30).



L Finletter (30).



G S McAlpin (30).



R Toland (27).

C't Langen (26).

T S Dando (30).

ON LONG ISLAND.

ACME GUN CLUB.

March 2.—The Acme Gun Club has been reorganized under its old name, and proposes to hold a target shoot at Dexter Park on the first Tuesday of every month. It seems hard to get Long Islanders interested in target shooting, and as a consequence only eight members took part in the club's first club event this afternoon. The scores were as follows, Job Lott winning with 18 out of 20:

Club shoot, 20 targets, known traps and angles:

Job Lott..11111111110111111101—18 J Banzer..10010011000011110001— 8
T Short....11111111101101110111—17 G B Hillers11010001100011001000— 8
E J Clark..11111111110100001111—16 H Lippack01010000000101010011— 6
W Sands..00111100100100100110— 9 J Linck....00100000000010100001— 4

CONEY ISLAND ROD AND GUN CLUB.

March 3.—Only six members of the Coney Island Rod and Gun Club turned out at Dexter Park this afternoon for the club's monthly live-bird shoot. The club event is at 7 birds, and in this event W. H. Lair (30) and Dr Raynor (26) tied for first on 6 out of 7. On the shoot-off Lair won with 3 to 2. Scores were:

W H Lair (30).....2102222—6 J B Voorhees (29).....1110220—5
Dr Raynor (26).....2022121—6 J Schlieman (28).....2010120—4
H Knebel, Jr (30).....1022110—5 H McLaughlin (27).....0101100—3

A 5-bird sweepstake resulted thus: Lair 5, Voorhees 5, Raynor 4, Schlieman 4, Knebel 3, McLaughlin 2.

CRESCENT GUN CLUB.

March 4.—There was a very small attendance at the monthly live-bird shoot of the Crescent Gun Club at Dexter Park this afternoon. Of the four members present, G. E. Loeble was the only one to make a decent showing in the club event at 7 birds, he winning the event with 6 out of 7, losing his last bird. Scores were:

G E Loeble.....2222220—6 L C Hopkins.....20001w
W J Passmore.....0200220—3 W D Gilman.....0200w

A sweep and team races filled up the balance of the afternoon, the scores in these being as below:

No. 1. Sweepstakes at 3 live birds, then miss-and-out, all 28yds.: E. H. Lott 2, L. C. Hopkins 2, W. J. Passmore 2, G. E. Loeble 1. Shoot-off, miss-and-out: Lott 1, Hopkins 0, Passmore 0.

No. 2. Team match at 3 live birds, $2, birds extra, all 28yds.: Loeble's team: G. E. Loeble 3, E. H. Lott 3, W. J. Passmore 1; total 7. Gilman's team: W. D. Gilman 2, John Sullivan 2, L. C. Hopkins 3; total 7. Shoot-off, 1 bird each: Loeble's team 3, Gilman's 2.

No. 3. Same. Gilman's team: W. D. Gilman 2, John Sullivan 3, L. C. Hopkins 0, Dr. Littlefield 2; total 7. Loeble's team; G. E. Loeble 1, E. H. Lott 3, W. J. Passmore 1, "Blind" 2; total 7. Shoot-off, same as above: Gilman's team 7, Loeble's team 5, withdrew on last round.

No. 4. Same. Gilman's team: W. D. Gilman 2, John Sullivan 2, L. C. Hopkins 1, Dr. Littlefield 2; total 7. Loeble's team: G. E. Loeble 2, E. H. Lott 1, W. J. Passmore 1, "Blind" 1; total 5.

No. 5. Team race at 3 birds: Dr. Littlefield 3, E. H. Lott 1; total 4. G. E. Loeble 3, Hopkins 0; total 3.

NEW UTRECHT GUN CLUB.

March 6.—Warren H. Thompson, a new member of the New Utrecht Gun Club, won the club shoot to-day at live birds on the Woodlawn grounds after a shoot-off with C. Furgueson, both men having scored 10 straight in the event. Thompson won the shoot-off by scoring 2 to 1. The scores in the main event were:

Class A.

C Furgueson (30)....1222222222—10 J Gaughen (28).....2022022222— 8
W H Thompson (27).1122111112—10 J A Bennett (29).....0222022021 – 7
N E Money (29).....1011212222— 9

Class B.

Conny Furgueson(27)2210212221— 9 Dr Littlefield (30)....1011002022— 6
F A Thompson (29)..2010201122— 7

Two miss-and-outs and two 5-bird sweeps were shot during the afternoon, the results being as below:

No. 1, miss-and out: J. A. Bennett 3, Money 2, F. A. Thompson 1.

No. 2, same: J. A. Bennett 5, N. E. Money 5, F. A Thompson 2.

No. 3, 5 birds, club handicap: Money 4, W. H. Thompson 4, Conny Furgueson 4, F. A. Thompson 4, J. A. Bennett 4, John Gaughen 4, Cornelius Furgueson 3.

No. 4, same: Money 5, F. A. Thompson 4, Bennett 4, Cornelius Furgueson 3, Conny Furgueson 3.

CRESCENT ATHLETIC CLUB, OF BROOKLYN.

March 6.—The attendance at to-day's shoot on the Bay Ridge grounds was not as large as other shoots of the Crescent Athletic Club have proved to be in the past. Out of the seven events shot, four were merely practice shoots, with D. Geddes and H. C. Werleman as participants. Geddes made the best record of the day, managing to get to the top of the list in each event decided. Scores were:

Events:	1	2	3	4	5	6	7	Events:	1	2	3	4	5	6	7
D Geddes.....	17	16	19	23	21	21	23	C A Sykes....	..	..	..	..	..	15	19	19
H Werleman.	8	7	11	13	10	10	8	G Notman....	..	..	..	..	..	14	15	20

BROOKLYN GUN CLUB.

March 6.—Only two members of the Brooklyn Gun Club were present to-day at the club's grounds, Liberty avenue and Enfield street. These two were H. P. Toler and F. Floyd-Jones. To pass the time away they shot a race at 50 targets, Toler winning by 2 breaks. Scores were:

H P Toler.....00100111010100111110111010111110100111001111010010—29
F Floyd-Jones....10110110111010111010101011010110100101010100101000—27

EMERALD GUN CLUB.

March 5.—The annual meeting and election of officers of the Emerald Gun Club was held this evening at 9 Madison street, New York city. The officers elected for this year are: President, Wm. Amend; First Vice-President, Dr. Wm. Richter; Second Vice-President, Chas. Stuetzle; Recording Secretary, Emil Weiss; Financial Secretary, Jos. Banzer; Treasurer, John H. Moore.

The distribution of prizes, which was also a part of the regular business at this meeting, was made as follows:

Prize.	Points.	Average, Per cent.	Prize.	Points.	Average, Per cent.
1..R Phister....	23	93	8..Gus Greiff....	16	96
2..C W Floyd....	22	88	9..E J Clark.....	16	88
3..John Woelfel.	20	72	10..Wm Sands....	15	80
4..Gus Nowak...	19½	84	11..G E Loeble ..	15	80
5..H P Fessend'n	17½	84	12..Emil Weiss...	15	83
6..Wm Amend..	17½	80	13..F W Place....	14½	60
7..Job Lott.....	16	85	14..G K Breit.....	2	43

Mr. Breit's prize was donated for the lowest number of points. The club's boundary will now be 50yds. instead of 80.

Warren Gun Club.

WARREN, O., Feb. 25.—The Warren Gun club opened the 1897 season to-day with its first club shoot, the scores of which are given below. On account of the inclement weather—a blinding snowstorm driven by a gale of wind directly in the faces of the shooters—the scores are not very high.

At our last club meeting we decided to put up the elegant silver cup won by our team in the Pennsylvania and Ohio Border League contests last season for an individual trophy. It will become the personal property of the member who wins it five times. We have tried to equalize this contest by giving a handicap allowance of from 1 to 8 misses as breaks to some contestants. On this occasion it was won by E. A. Biery, who broke 21 out of 25 targets shot at, which with his allowance of 5 gave him the highest possible score.

Cup contest, handicap allowance of misses as breaks:

E A Biery (5).....1101110111111111101111110—21+5 - 26
J W Nonneman (0).....0011111111110011111111111 —21
A J Sutcliffe (5).....0101111011101110110011001100—16+5 - 21
C L Schoonover (0).....1100011011101011011111111 —18
R W Ewalt (0).....1111011110000111001111011 —17
H Miller (3).....0001111011001001111010110—14+3 –17
T G Dunham (2).....1000101010101011101101200 –13+2—15

Another 25-target event resulted as follows: Schoonover 20, Nonneman 18, Ewalt and Biery 17, H. Miller 15, Sutcliffe 13.

R. W. EWALT, Sec'y.

Baltimore Shooting Association.

BALTIMORE, Md., Feb. 24.—The team race at 50 birds per man, Johnson-Simm vs. Bonday-Jamison, was the main event on to-day's programme, the cup contest being again postponed until March 13. The first-named pair won the race with 79 to 76, Jamison losing his last 5 birds just when he and his partner looked sure winners. Scores were:

Johnson.....0202212102200202012222122212121022122222222220222202—41
Simm.....1222222212212222220•1122202120112010020202202120220 2 – 38—79

Jamison.....2212200222201222222222022202202221201222•120200000—36
Bonday.....2222202112012022211102002112 1••12221201222222202222—40—76

No. 2, 10 birds, $7 entrance, ties shot off in next event: Simon 9, Dupont 9, Jamison 7, Jackson 9, McCormick 9, Gent 9, Bonday 8, Malone 8.

No. 3, 7 birds, $5 entrance: Simon 7, Dupont 7, Jackson 7, McCormick 6, Gent 5, Bonday 6, Malone 4.

No. 4, $2, miss-and-out: Dupont 1, Jackson 3, Jamison 3, McCormick 1, Simon 2.

No. 5, same: Dupont 5, Jackson 1, Jamison 4, McCormick 3, Simon 6, Bonday 6.

Trap-Shooters' League of Philadelphia.

PHILADELPHIA, Pa., March 6.—The first tournament of the newly-organized Trap-Shooters' League of Philadelphia was held to-day on the grounds of the Florists' Gun Club at Wissinoming Station. Eleven teams competed in the team race, the teams consisting of six men to a team, and each man shooting at 25 targets, known angles. The race was won by the Independent Gun Club with 128 out of 150. In second place came the Penn Gun Club with 119. The Florists were third with 116. Scores were:

Independent Gun Club: I. Wolstencroft 23, H. Landis 23, W. Wilson 22, W. H. Wolstencroft 22, H. Ridge 21, H. Thurman 17—128.

Penn Gun Club: J. Yost 23, Wood 21, Ritter 21, Smith 20, P. Yost 19, Gross 15—119.

Florists' Gun Club: C. D. Ball 21, G. Anderson 20, S. P. Life 20, J. W. Colflesh 19, J. Burton 18, A. B. Cartledge 18—116.

Silver Lake Gun Club: Ford 22, Apker 21, Woodsteger 20, Vincent 18, Mink 17, Hahn 13—111.

Glen Willow Gun Club: J. Cowan 22, C. Weinman 19, W. Butler 17, W. Cowan 17, C. Sturm 15, J. Innes 14—104.

Roxborough Gun Club: G. McFalls 21, W. Free 19, J. Taggert 18, H. Blundin 16, R. Gilmore 16, G. Lancaster 14—104.

Southwark Gun Club: Thompson 20, Timme 20, La Rue 18, Stoffer 16, Leaming 15, O'Brien 13—102.

Forest Gun Club: G. G. Frances 20, Morison 18, Baum 18, Hothersall 18, Morgan 11, Van Nort 11—96.

Frankford Gun Club: H. George 18, J. Crowther 16, D. D. Mercer 16, W. Lesher 15, G. Radcliffe 15, B. Bourne 9—89.

U. of P. Gun Club: Kistler 18, Freed 18, Cooper 16, Tuthill 13, Steel 13, Conklin 6—85.

Wayne Gun Club: Soistman 22, Seidel 18, Treadway 15, Emory 12, Connell 9, Green 7—83.

Several sweeps were shot during the day, all events being either at known or unknown angles. Scores were:

PUBLISHERS' DEPARTMENT.

Asheville and Hot Springs.

PARADISE is said to be "A place of bliss, a region of supreme felicity or delight." Better terms cannot be used descriptive of Asheville and Hot Springs, N. C., and yet the thousand attractions which exist there must be seen to be appreciated. Situated in the heart of the mountains, with the Smoky, Blue Ridge and Balsam ranges in sight, is "The Land of the Sky," and one of the most beautiful spots in the whole world. At a distance from Asheville, and forming a distinct outline against the heavens, stands Mount Pisgah in all its glory and magnificence. Western North Carolina is not a fairy land, but a country beautiful beyond description. In the trip over the Southern Railway to these charming resorts nature's panorama is unfolded, showing picturesque scenes of the grandest kind. It matters not whether you view the mountains or gaze into vast depths or sylvan glens, all you see inspire you with the glory of your surroundings. Asheville is 2,300 feet above sea level. The climate is delightful the year round. The air is never damp, and sunshine is prevalent. There is where the invalid, business man and pleasure seeker come to breathe the pure, invigorating mountain air.

A more delightful time of the year cannot be found than to spend the month of March in the mountains of western North Carolina. Protected by the ranges of mountains on all sides, the disagreeable March winds that are prevalent are avoided. The Southern Railway operates a most perfect through-car service between New York, Asheville and Hot Springs, leaving New York daily at 4:30 P. M., via Pennsylvania, reaching Asheville next afternoon at 2 P. M. and Hot Springs 4 P. M.

Full particulars regarding excursion rates to the resorts can be had upon application to the New York office (271 Broadway) of the Southern Railway, who will give you all information regarding the resorts located in the glorious mountains of western North Carolina.—*Adv.*

Land of Snow to Royal Palms

CAN be reached from New York within twenty-eight hours' ride on the most superbly equipped vestibuled train via Pennsylvania R. R. and Southern Railway. Three trains except Sunday every day in the week between New York and Florida. The peerless New York and Florida Limited leaves New York at 12:10 noon daily except Sunday, giving a most perfect service. This train is composed exclusively of Pullman dining, compartment, drawing-room, observation and sleeping cars, and is operated solid between New York and St. Augustine, reaching the land of palms before dinner next day; or you can leave New York at 4:30 P. M.; through Pullman drawing-room sleeping cars are operated between New York and Tampa; 12:15 A. M., through Pullman drawing-room sleeping cars, New York and Jacksonville. Connections are also made on above trains for Augusta and Aiken. The New York and Florida Limited also carries a Pullman drawing-room sleeping car New York to Augusta. New York office, 271 Broadway.—*Adv.*

SALMON AND TROUT FISHING LEASES.—Five-year leases of the exclusive right of angling on a large number of the best salmon and trout rivers and lakes of the Province of New Brunswick are to be let at public competition at the Crown Land Office, Fredericton, on Wednesday, March 24. The salmon rivers embrace the famous Restigouche, which is divided into eleven sections of five or six miles each; the Kedgwick, Patapedia, Upsalquitch, Jacquet, Renous, Dungarvon, Tobique and Green. Among the trout streams are the Pokenouche, Tabusintac, Bartibog and Upper Upsalquitch, and the South Oromocto Lake. Particulars may be had from D. G. Smith, Fishery Commissioner, Chatham, N. B., or Hon. A. T. Dunn, Surveyor-General, Fredericton.—*Adv.*

FROM SNOW TO SUMMER IN A LITTLE OVER TWENTY FOUR HOURS is a quick and startling transition, but improved railway travel has accomplished it. Good roadbeds, handsomely-equipped trains, record-breaking time make a trip from New York to Florida a pleasant one. The Atlantic Coast Line *via* Richmond is one of the most popular lines to the South. In connection with the Pennsylvania Railroad it carries passengers in solid vestibuled, steam-heated and electric-lighted trains, known as the "New York and Florida Special," from Jersey City to St. Augustine in exactly twenty-seven hours. It also has fast through car service to Aiken, S. C., and popular Georgia resorts. The bureau of information is at 229 Broadway, N. Y.—*Adv.*

Down the Shenandoah, but up Broadway.

THE Norfolk & Western Railway, Shenandoah Valley route, the most picturesque route to the Southern States, announces a change in the location of its New York office. No. 487 Broadway (telephone, 1875 Spring) is where J. E. Prindle, N. Y. Pass. Ag't, and L. J. Ellis, the Eastern Pass. Ag't, of the Shenandoah Valley route, have now hung out the shingles of the road they represent.—*Adv.*

Audubon's Birds.

DR. J. D. USHER, Sicily Island, La., advertises for sale copies of Audubon's "Birds of North America," and Audubon & Bachman's "Quadrupeds of North America."—*Adv.*

FOREST AND STREAM OFFICE

346 Broadway

NEW YORK LIFE BUILDING

Present Entrance on Leonard Street

Bear-hunting, as a general rule, I do not think would appeal to most sportsmen. It is rather slow work, and one is often very inadequately rewarded for the time and trouble spent in hunting up bruin. There is hardly a portion of the mountains where there are not evidences of bears, but I do not believe that in any locality they are especially abundant. They have been hunted and trapped so long that those which survive are extremely cautious. In my experience there is no animal gifted with a greater amount of intelligence, and, in this region, the hunter's chief virtue, patience to wait and stay in one spot, is sure to be rewarded, sooner or later, with a good shot which should mean success. Archibald Rogers.

THE NEW FOREST RESERVES.

IN another column we print a letter from a Washington correspondent, who takes exception to a recent editorial in FOREST AND STREAM on the new forest reservations, and gives a number of reasons for his belief that the setting aside of these new reservations will work injury to the Western country and to its residents. This letter voices a sentiment which is widely extended through the West, and which is natural enough to people who imagine that their interests are threatened. The alarm manifested, however, is groundless, because it is based on an entire misapprehension of the facts.

When the National Academy was requested to nominate a committee of forestry experts, it was for the purpose of examining the forests of the public domain, and preparing a comprehensive plan for their preservation and care. The first part of this work has been done. The forests have been examined, and as a result the Commission has recommended the establishment of the thirteen reserves which we have enumerated. It is now continuing its work, and has passed on to the second portion of it, that is to say, to the preparation of a plan for the care of the forests. After this plan has been worked out, it will recommend legislation looking toward the preservation of the forests and such use of them as shall make them of the greatest value to the people of the United States, no matter where they reside.

In considering the recommendations of the Commission, it is worth while to remember that the men who compose it are those of the very highest rank in their various special fields of work. The Commission includes not only a trained forester, but also an engineer, a geologist, a botanist, a mining expert, a naturalist and a person familiar with our river systems. With hardly an exception these men have for many years been familiar with the Western country and its needs. Several of them have spent more than thirty years traveling North and South, and East and West, over prairie and mountain, from the Pacific to the Missouri River, from the Mexican boundary line south to Mexico. They are thus neither "pilgrims" nor persons dominated by a single idea, since they represent as many professions as they do individuals, and since each one stands high in his profession. It seems, then, reasonable to believe that such men will take a broad view of the subject of our Western forests, and will consider carefully not only how they may best preserve these forests, but also how they may best avoid working harm to persons of any class, or to the residents of any section.

Our correspondent, and the dispatches published from widely separated localities in the daily newspapers, talk about the injury to settlers, the injury to miners, and the injury to stockmen, that will be worked by the establishment of the forest reservations. We believe that these people are all wrong, and that they say these wild things merely because they do not understand the facts of the case.

We have it on the best authority—that of the Commissioners themselves—that the Commission will recommend that agricultural lands lying within the reservations named shall be excepted, so that the settler who wishes to do so may take up a claim of arable land within the reservation just as he might have done before the reservation was established; that miners will be allowed to prospect and to mine on the reservations, and to cut timber for use in their mines; that actual settlers will be allowed to cut such timber as they may need for domestic purposes—that is to say, for the building of houses and barnes, of fences and corrals, and for fuel. But we may feel confident that miners will not be allowed to burn the forests through carelessness or by intention, and that individuals will not be allowed to go on the public land and cut for commercial purposes the timber which belongs not to them, but to the people at large.

Thus it will be seen that the rights of no individual are to be interfered with; that no settler will be prevented from taking up a ranch; that no prospector will be hindered from searching for minerals, no miner from working on his claim. All the temper, all the speeches and all the resolutions which have been expended on this subject have been uncalled for. They have been shots fired at a phantom.

No one who has long been familiar with the Western country (and especially with the forests of Washington and Oregon) can be ignorant of the enormous damage that has been done by forest fires there, nor of the vast quantity of timber that has been cut on Government land, taken out, sawed and sold, without one penny of return to the general Government. It is to put an end to abuses such as these that the forests should be cared for. They are to be protected, not in order that they may not be used, but that they may be used, but used in an intelligent way, and so may become to this Government what they surely would be if they were in private hands: a source of income, a part of the material wealth of the people.

It is worth while in this connection to recall what has been the course of affairs in other forest reservations, set aside in recent years. In such reserves no settler has been disturbed, no miners have been interfered with. Instead of this, settlers have carried on their ranches; built their houses, barns, fences and corrals, and pastured their cattle on the reserves. Miners have prospected, established their claims, sunk their shafts, run their tunnels and timbered them. To none of these classes of individuals has any injury ensued because of the setting aside of the reservations.

It is necessary that such reserves should be established. This is the initial step in a system of forest preservation such as all intelligent persons must acknowledge that this country needs. No one's rights can be encroached on without legislation by Congress, and no legislation can be enacted without a full discussion, in which each section of our country will have a voice. Such alarm and apprehension as are expressed by our correspondent are uncalled for. It would be better for the people directly concerned not to get excited about things of which as yet little or nothing is known, but to wait until fuller information shall enable them to form an intelligent opinion on the subject.

In many communities there has been ill-considered agitation about these reserves, which does not at all reflect the sober judgment of the general public. It may very well be that much of this hasty talk comes from persons who "go off at half-cock," and make speeches and offer resolutions without at all knowing what they are talking about. It must be remembered though that the great body of the American people who are adults use intelligence and reason, and do not, like little children frightened by a stump bear, run shrieking away from a danger that does not exist.

We urge the people of East and West alike to take a temperate view of this subject of the new forest reserves and to await the final report of the National Forestry Commission before rushing to a conclusion that either the East or the West is to be ruined by the establishment of the reserves. *A priori*, the facts are all in favor of wise recommendations by a Commission made up of such men as is this one; and we venture to predict with confidence that in a few months those persons who are now making the most outcry about the injury likely to be done will be the most enthusiastic in favor of the plan which the Commission shall recommend.

FOR THE INDIGENT POOR.

IT has been left for a New Jersey assemblyman to take a step which will go far to compel for the game laws the sympathetic indorsement of all charitably disposed citizens; in one State at least no longer will be heard denunciations of game protection as a system unjustly devised and maintained for the benefit of privileged classes. Henceforth the game law of New Jersey may shine forth as a beneficent provision for a deserving part of the community. Mr. Ambruster has introduced in the Assembly at Trenton a bill which runs:

> It shall be lawful for the board, body or authority having charge of matter affecting the indigent but worthy poor to issue permits to said poor to shoot game, birds, rabbits, catfish and quail, in order that they may so provide for their sustenance and no longer be a charge on the municipality in which they live.

Is not one who is simply poor quite as much entitled as one who is both poor and indigent to gather a sustenance of wild game? Should the indigent poor have hunting privileges refused the poor? Moreover, if the indigent poor of New Jersey are ever to fill themselves with quail and catfish, Mr. Ambruster's measure should carry with it an appropriation for powder, shot, car fare, dog hire and mosquito lotion.

SNAP SHOTS.

We regret that the New York (City) Association for the Protection of Game should have considered it expedient to compromise with the market men as to Section 249 of the game law, permitting the sale of game the year around. As we understand the case, the Association was moved to recommend a compromise, because President Gilman, of the commission men's organization, gave out that he owned the legislative committees, and any new legislation approved by those committees would be only such as he, their boss, might sanction. Before accepting Mr. Gilman's representations, it would have been the part of prudence for the Association to inquire whether or not he really did carry the Albany committees in his pocket. There is a possibility that he was bluffing, and there is a probability that the Senate and Assembly committees would give honest consideration to the subject. Under such conditions, united action by the sportsmen of the State, as represented by the State Association, would prevail to win repeal of the iniquitous measure. As the case now stands, one hears it said at Albany that the New York (City) Association is for compromise, and that therefore compromise, and not repeal, is the expedient action. There should be no compromise. Section 249 should be repealed unconditionally.

The committee on the Fly-Casting Tournament at the sportsmen's show at Madison Square Garden is composed of anglers who are so devoted to the sport that they need little to intensify their enthusiasm. If anything was lacking, an incentive came for them in a telegram received Monday by Manager Frank W. Sanger from Horace Smythe, secretary of the San Francisco Fly-Casting Club, who triumphantly wired that Walter D. Mansfield, the club's president, had just broken the world's record for long-distance fly-casting during the progress of the club's tournament Monday. Mr. Mansfield's cast was 108ft. 6in., and was a single-handed cast.

The Baldwin bill in the Pennsylvania Legislature is an excellent measure in so far as it will provide a State game and fish warden and a force of deputies. There should be such executive machinery in Pennsylvania as in every civilized commonwealth. To leave the enforcement of the fish and game laws to an unsalaried fish commission is the poorest possible economy. We believe that the wiser plan would have been to make the warden wholly independent of the Fish and Game Commissioners. There is no necessary connection between the activities of fishculture and fish planting and the enforcement of the fish and game laws. The Fish Commission should not be taxed with the work of executing the statutes. To give them the appointment of wardens is to put upon them a thankless, burdensome, distracting and aggravating task, in which petty politics interfere with their proper work. However, the system provided by the Baldwin bill is so decidedly an advance upon the present situation that the measure should have the heartiest support of all good citizens. Fish and game law violations in Pennsylvania are disgracefully common; an end must be put to them; this cannot be done unless to do it be made the duty of some one responsible official. This is the purpose of the Baldwin bill. We trust that it may become law.

The Sportsman Tourist.

RECOLLECTIONS OF IOWA.—II.

"And did the dust
Of these fair solitudes once stir with life
And burn with passion? Let the mighty mounds
That overlook the rivers, or that rise
In the dim forests crowded with old oaks,
Answer: A race that long has passed away
Built them. The red man came—
The roaming hunter tribes, warlike and fierce—
And the mound builders vanished from the earth.
The solitude of centuries untold
Has settled where they dwelt. The prairie wolf
Howls in their meadows, and his fresh dug den
Yawns by my path. * * *"

THERE was plenty of novelty and romance in my early life in Iowa in the long, long ago. Now Iowa is regarded as one of the old States, and, if my memory serves me, statistics show that she produces more hogs and corn than any other State in the Union. Really it doesn't seem possible, for when I was a boy it was about all we could do to get hog and hominy enough to keep us through the winter. But I presume times are changed. Well do I remember the time when there wasn't a house or other evidence of civilization for a hundred miles northwest of our house. But then that was a long time ago, and the world keeps moving along, I suppose. Even the traditionary mound builders were forced to give way to the plundering red man of later times, and now the red man has given place to his pale-faced successor. Yes, he and his night of ignorance and superstition, in which he so delighted to revel, have given place to the light of intelligence and civilization.

Novel indeed, and in a sense romantic, were the early days in Iowa. Even going to mill in those days, when there were no roads, no bridges, no ferry boats, and scarcely any conveniences for traveling, was no small task where there were so many rivers and treacherous streams to be crossed. Such a trip was often attended with great danger. But even under these circumstances some of the more adventurous and ingenious ones in cases of emergency found the way and means by which to cross the swollen streams and make the trip. At other times again all attempts failed, and they were compelled to remain at home until the waters subsided, and depend upon the generosity of their more fortunate neighbors. The Ellis boys had been on their claim but a few months when it became necessary to go to mill, for although hominy was a pretty good substitute for bread, the corn they had brought with them was about out; and not only had they to go 100 miles to mill, but they had first to work to buy the grain. It was not unusual to be gone three or four weeks on such a trip. At the start, in this instance, North 'Coon, then out of its banks, had to be crossed. There was no ferry boat, not even a canoe, and wagons, yokes, chains and camp furniture had to be taken over on log rafts. The current was too deep for setting poles, and swept them a long way down stream. The wagon had been crossed and debarked in shallow water, the four oxen driven across, yoked and chained together, the traps loaded in, when the oxen, true to their reputation for stubbornness, took it into their heads to return to their stalls on the west bank. When they struck the main current it swept them, of course, down stream, and they soon became entangled in their chains and the floodwood. They struggled and strangled for a long time, until in fact they all save one seemed to have a through ticket. Old Ben would paddle for the west bank whenever he came up. Isaac Ellis, the youngest, finally stripped and swam to them, and with his pocket knife cut the bow keys, unyoked the oxen, and got them safely to land. About this time Isaac Ellis went west of the Missouri, hunted with the Indians, and supplied for some time several stations of the overland stage company with deer, buffalo and other wild meat. When last heard from he was with the Indians in British America. But here was an example of the difficulties and dangers to be encountered and overcome by those hardy frontiersmen of the early days in their efforts to supply themselves and their families with the very necessaries of life and keep the wolf from the door. Although too young to engage in any of these hazardous undertakings of pioneer days, it was one of my chief delights to sit quietly in a corner and listen to the stories and discussions of my elders regarding them. It has never been satisfactorily explained why it is that scenes and incidents of comparative insignificance transpiring in one's youth remain fresh in the memory, indelibly impressed upon one's brain for scores of years—yes, even until death—when incidents of greater importance transpiring quite recently vanish from memory as if they had never occurred at all. Possibly it is because "the morning of life is like the dawn of day, full of purity, of imagery and harmony," and while we shut the door against the setting sun

"In our remembrance blossom
The images long forsaken."

At any rate, nearly all the scenes and incidents of our youth are as fresh and well defined to-day as if they had occurred only yesterday.

I remember hearing William Ellis telling father how he and George Haworth set out to follow the Raccoon River on the ice from Fort Des Moines up to Stump's cabin, about twenty miles by land. After a hard day's travel of about twenty-five miles, they found themselves, when night overtook them, not more than half way to their destination. They attempted to cross the country, but for various reasons had to give it up, and they had to camp for the night. They had neglected to take matches (unpardonable in frontiersmen) and they had to either walk or in some way get a fire. They got a fire after the expenditure of a good deal of patience and powder by firing their guns into dry grass, and then they carried their fire to the timber a half mile away, where they spent the night with a reasonable degree of comfort. The relation of the incident made a lasting impression upon my young mind, and I cannot now recall ever being caught without matches.

There was game in abundance in that country during the time of which I write. Deer and elk were quite plentiful for some time after the first settlements were made, and there were some great hunters in those days as well, men who enjoyed the sport too as well as any of us do at the present time. The capture of elk calves was, in those early days, a favorite pastime. In these adventures John Wright was the leader. The outfit consisted of teams and covered wagons sufficient to convey provisions, camp equipage, etc., and to bring home the proceeds of the chase. Cows were taken along to furnish milk for the young elk, and sometimes the expedition would be gone a month or more. From Greene county to the headwaters of 'Coon was the favorite hunting ground. The hunting was done on horseback. First the old elk were found and then, with the aid of dogs, the calves. These were generally found in the tall grass surrounding the ponds that abounded in that part of the State.

When the calf found that he was observed he would spring from his hiding place and run for dear life, and if he was two or three weeks old it took a good horse to overtake him, among the bogs and ponds. Many a good horse was ruined. Sometimes a calf, if very young, was captured by springing upon it in its bed. On one of these excursions John Wright saw a dark object in the distance, which he, true to his nature, proceeded to interview. It proved to be a half-grown black bear, which took to immediate flight. John came up with it and, by a flying leap from his horse, attempted to grapple with it. As John landed the cub turned and received him warmly. John was now in his true element, and after a long struggle, in which one of his hands was badly lacerated, besides sundry other bites and scratches, he bound his captive and took him to camp. On this particular trip John captured at least twenty young elk besides his bear. The last heard of John Wright he had followed the footsteps of Isaac Ellis and disappeared among the Indians of the far Northwest. These elk were a sad disappointment to the settlers. They had theorized upon the subject and concluded that they could be made most useful domestic animals for the plow and cart, and possibly for the dairy. In size, form and general characteristics they were cousins to the reindeer. Their speed and bottom had been proven, and their meat was equal to or better than the ox. They could winter where a mule would freeze, and were easily domesticated. Take a young elk that never before saw the face of man, carry it in your arms a short distance, and it would follow you through fire and water. The theory was fine, but in practice the elk turned out to be unmitigated nuisances. They would not work at all, and wouldn't play only in their own way. In the early fifties much valuable time was spent by father and the others in breaking them to harness and saddle. Elisha Morris harnessed a span of two year-old bucks to a light buggy and started for some of the Eastern cities, where it was thought the outfit would command a good price. Eight days' drive took him to Oskaloosa, where he swapped the whole outfit for a horse, which he sold for $80. Lish said said they wouldn't work—"they were too much like an Injun."

Around home they were regarded as outlaws, going at their pleasure into fields and gardens and doing much mischief just out of pure wantonness. They seemed to know that a horse would stampede at sight of them, and they had lots of fun out of it. They would curve their necks, throw up their great horns, set their hair forward, and snort to make it more interesting, and runaways were very frequent. I well remember how Bilderback's elk over on South 'Coon scared father's team one day when we were going to mill, and how the horses in their fright tried to straddle a big jack oak, demolishing the whole outfit except father and me. When we saw the inevitable right in front of us father and I slipped out over the hind end gate and escaped injury.

At certain seasons of the year the males were as dangerous as mad bulls. A son of Dr. Rush at Fort Des Moines was attacked by one, his abdomen ripped open so that his bowels protruded, and for a long time his life was despaired of; but he finally recovered.

I cannot remember when I first began trapping prairie chickens. It must have been at least forty years ago. There were myriads of them. They were in the cornfields, in the wheatfields, in the buckwheat fields, in the grass—everywhere. During the autumn and winter they would gather in flocks of thousands. The first telegraph wire that was strung across the State passed our place. Only a single wire, it is true, but many chickens lost their lives on it by flying against it, and us boys used to go out along the line after school hours and gather up numbers of them. Father had large fields of various kinds of grain which I appropriated as my exclusive chicken preserve, and compelled the other boys to respect my rights, often by force and arms. I sold my chickens at the corner grocery at 50 cents a dozen, and was regarded by the other boys as the chicken king of the country. I did make lots of money, and to the best of my recollection never missed a circus that visited Fort Des Moines from the time I was out of my swaddling clothes. I remember one winter in particular. I think it was in the winter of '59 and '60. Father had a ten-acre buckwheat patch right by the house that did not mature properly, or at least it was not harvested, for some good and sufficient reason. During almost the entire winter that piece of ground was one living, moving mass of prairie chickens. And rest assured that I was not slow to reap where others had sown. I made the best that a nine-year-old boy could of the opportunity. Most of my traps were made of lath with figure 4 triggers, and four or five chickens at a clip in each trap was nothing unusual. But I had one trap made of rails with a wide shingle on a pivot at the top and an ear of corn suspended over it. The chickens would jump up on the trap and walk out on that shingle to reach the corn, when it would tip, let them down inside and fly back to place. I took twenty-three chickens out of that trap at one time.

It was about this time that I shot my first chicken. The incident is still quite fresh in my memory for various and obvious reasons, and I guess I will have to relate it. I have fired many, many thousands of shots at various kinds of game since that time, but I cannot now recall one that made a more lasting impression. Father had a No. 14 muzzleloader (of course it was a muzzleloader) that I had been taught to look upon as forbidden fruit. It generally hung high up on the wall—to lessen the temptation, I suppose. Well, on that auspicious day I had started out to my traps, when I came upon a vast flock of chickens on the side hill above the barn. They were very tame and manifested no disposition to fly, and it occurred to me that if I only had father's shotgun I would fix them plenty. It has been said that he who hesitates is lost. I hesitated. Then I stole back to the house, got up on a chair when no one was observing me, and took that shotgun down from the rack. Doubtless I felt somewhat as Adam must have felt on that inauspicious day when he took down the first apple in the Garden of Eden. But I had the gun at last—at last. The chickens were still there on the side hill, and very accommodatingly tame. I squatted down, slipped the gun well back under my arm so as to get my eye as near the rib as possible, aimed at the nearest chicken, shut both eyes and pulled. * * * It bursted both my lips, knocked my nose out of place, kicked me clear down hill, jumped on me and kicked me some more. I did not look for either gun or chicken, but gathered up my face and ran for the house. Of course mother sympathized as mothers do, and relieved me as only a mother can, but father said nothing. He simply put on his hat and went out. Presently he returned with the gun and a chicken, and remarked that I had made a good shot. I said nothing, but wondered then and have often wondered since whether it was really the chicken I had shot at. Father was a man of pretty good sense, and he saw that I felt that it was time for me to learn to shoot. So he proceeded to teach me how to load and handle the gun, and from that time on of course the gun was mine. As a matter of curiosity I wish that I knew how many chickens, quail, pheasants, ducks, geese, sandhill cranes, squirrels and rabbits fell by that old gun before it met its ignominious fate. Several years after I had assumed full and complete possession and ownership of the gun I was helping the hired man haul corn fodder from the field one winter's day, and had the gun along to shoot chickens off the corn shocks. It was part of my business to open and shut the gates, on which occasions I would leave the gun lying across the sled. Its time had arrived. The breech fell through between the cross bars of the sled, and before the team could be stopped it was twisted all out of shape and totally ruined. Guns were scarce in those days, and my lamentations were correspondingly profound and prolonged.

PORTLAND, Oregon.

[TO BE CONTINUED.]

PODGERS'S COMMENTARIES.

SAN FRANCISCO, Feb. 28.—I read the other day in the FOREST AND STREAM an article discussing whether fish had memories. I don't suppose it makes any very great difference to the community whether they have or not, but there are a great many readers of FOREST AND STREAM doubtless who will take an interest and give their experiences, for there is precious little above the waters or under them that the said readers do not know something about, and are full of "wise saws and modern instances," and we should like very much to hear from the cow counties what is known, pro or con, on this subject. For myself, to lead off in the discussion, I am inclined to think that fish have memories, and very good ones; for many a time when I have pricked a trout, notwithstanding all my efforts, changing flies and resorting to bait, trying all the allurements possible as he lay in his hole visible in the clear water, slowly vibrating his tail, and saying as plainly as a fish can say, "No, you don't, my love; you can't play that game on me twice; that hook was not pleasant." It was no use while he was cogitating over it to fool away the time, but next day, when I hoped he had forgotten all about it, and probably with a better appetite he would try it again; but it always seemed to me that he went very gingerly about it, showing very possibly a lingering recollection of the previous experiment.

Again, I have noticed in artificially raised trout in fish ponds that when the person who was accustomed to feeding them passes near the edge of the pond they would all rush toward him and follow him around, but did not do so when I walked along the path. They certainly recognized the man, and did not know me. Was it memory, or instinct, or reason?

To recognize is memory. Many people argue that all examples of intelligence in animals is instinct, wherein they are wrong. Do not horses, for instance, remember the hours at which they are accustomed to be fed, as is the case of every animal in a menagerie. I have seen instances where, when fish in an artificial pond are fed at noon, they would gather at the particular spot where they were fed some minutes before the time, awaiting their dinner. So, on the whole, I am of the opinion that fish have memories.

Our Legislature is again in session, and I see that the crank of a granger is attempting to get in his work, as usual. One bill was introduced giving permission to shoot quail at all seasons of the year; another to kill all the meadow larks, assigning as a reason that they ate all the grain and grapes. Why they did not include the boys who eat grapes, and apples as well, must have been overlooked. The granger begrudges the birds the waste of grain that is left after gathering, presumably, as that is the only time they do. Liberal-hearted are these gentlemen who introduce such bills. No wonder the Lord gives them short crops occasionally as a punishment for such meanness. But to the credit of the Legislature these bills were thrown out, and they passed a bill forbidding the shooting of robins at any time, which is commendable. Another bill was introduced repealing the close season on salmon, but that was squashed also, so we have hopes that the poachers are not going to have things all their own way this time. They are the lowest order of foreigners, Greeks and Austrians, who decry all laws, and are the roughest element we have; yet they find politicians who pander to their votes, regardless of the interests of the decent community. It is a source for congratulation that the present Legislature is starting off so well, and we hope our game laws will not be tampered with this session.

The legal fraternity is generally accused of possessing a superabundance or what in American parlance is termed "cheek," and they don't seem to deny it; but if proof were wanting of the hardness thereof, it was in evidence in a case that a few days ago occurred a short distance from the city. A lawyer and friend were driving along the country road in a buckboard where the quail were very abundant, when whack! came a stunning blow on the legal gentleman's cheek that made him see stars, and a small object dropped into the bottom of the wagon, which proved to be a quail, and as stone dead as a quail was ever seen. In flying across the road it had struck the gentleman fairly on the cheek and dropped dead, killed by the concussion. But what about the gentleman, say you. There is where the joke comes in. Beyond a brief lesson in astronomy and view of the constellations, it never phased him; but the quail paid for his ignorance of the predominating characteristics of the legal profession. A case somewhat parallel to that of the snake that bit the old woman, resulting in a dead snake. I may add that the quail met the usual fate of a client—had his bones picked.

The last number (Feb. 20) was particularly interesting, especially the description of "Hunting on the Spanish Main," by J. F. Le Baron. That is somewhat familiar ground to me, for I have crossed the Isthmus of Nicaragua several times, and by the same token I call the lake of Nicaragua one of the most beautiful lakes I ever saw, and I thought what a lovely time I could have with a trim little yacht, in which to cruise along its shores. Mr. Le Baron's allusion to the peccary or mule-footed hog reminds me of an episode happening to a friend in Tampico, Mexico, who was engaged to be married. The morning of the day it was to come off, he being debarred of the society of his lady love that day by reason of the necessary preparations for the ceremony, and taking his gun and strolling out of town to pass away the time intervening, encountered some peccaries, one of which he shot and wounded. This brought a large drove of them, which he found were decidedly belligerent, and perforce he had to take to a tree, which they surrounded, and persisted in remaining to guard. The time wore on with no signs of their departure. The evening shadows were falling. The wedding ceremony was to come off at 8 o'clock and how to get down from the tree was a question. He tried banging away at the animals, but that only made matters worse. The bride and friends were punctual at the church, but no bridegroom put in an appearance, and after waiting a full hour the bride went home in tears and mortification, under the impression that she had been jilted. The bridegroom had been seen going off in the morning with his gun, and becoming alarmed at his non-appearance, a party was organized next day to go in search, concluding some accident had happened to him. They found him still in the tree surrounded by his tormentors and rescued him. The explanation satisfied the bride, and the wedding came off all right that evening, but the poor man never heard the last of it.

A friend who went out for a day's shoot a few days ago came back in high disgust without a feather, and being questioned, said he found that every place that looked like good quail ground was posted; and as an evidence that the schoolmaster was abroad he put one of the notices in his pockets, which read as follows: "Doods with guns and fish poles are warned to keep off these ere premises.—JOE BUNCE. N. B.—I keeps a dorg."

Speaking of signs reminds me of that of a Chinese wash man, who evidently had employed some waggish "Meliky man" to paint it for him, reading: "Ching Sing, Washing, Pinking, Ironing, and all that sort of thing," and being at a loss for a finish, had added, "We may be happy yet." There was a sign on a Sacramento street miners' hostelry that read in the old days, "Rest for the weary and storage for trunks." In those early days it had a significance, as there were no express wagons or impecunious gentlemen to tote baggage from the steamers. Every ragged, seedy-looking chap you saw lounging around had a pocketful of gold dust, and scorned anything like work, hence every man had to shoulder his own traps, and by the time he reached a house of entertainment was quite likely to be "weary." The first time I landed here on the beach from the steamer, after paying $10 for landing myself and trunk, I looked around for help to carry it up a short distance to the shanty of a friend, and seeing a colored gentleman leaning against a pile of lumber, asked if he would take hold of one end. Rather to my surprise he complied, and when I asked how much I owed him he replied, "Oh, nothing, boss; I specks I has more money than you has," which I have no doubt was the case, after my enforced stay of six weeks in Panama. Those were the days when a man with a wheelbarrow or handcart could earn his $50 every day of the week. He would be a smart man to do it now in a month. PODGERS.

A STORY OF THE MATANZAS.

OTTUMWA, Ia.—*Editor Forest and Stream:* Mr. Fred Mather's most interesting and touching account of the trials, troubles and sad end of his venerable companion Geo. Raynor recalls to my memory an incident which happened to me during my rambles in Florida in the winter of 1876–77, which is of such a weird and uncanny nature that I have always refrained from telling it in public for fear of injuring my reputation for veracity. However, a few of my intimate friends have listened to my tale to the end, but their remarks have ground harshly upon my feelings, and it is some fifteen or sixteen years since I have related the incident for the last time. It was forgotten until Fred Mather refreshed my memory with his charming account of Geo. Raynor. My only reason for bringing the story before the public now is a desire to ascertain if possible whether or not there is any truth in it. I will give it as it was given to me by the victim one beautiful night in March, 1877:

I had but a few days left for my sojourn in St. Augustine, and intended to gather what shells and sea beans I could for distribution among my friends. In a small sailboat and with a fair easterly breeze I soon landed on St. Anastasia Island, at a place called the Divides. This is where the waters meet when the tide rises, flowing north from the inlet at Matanzas, and south from that of St. Augustine. To my right I noticed a clearing about half an acre in extent planted with vegetables of various kinds; at the end of it, among the dense and luxurious undergrowth of the island, stood a shanty built entirely of saplings and resembling the bamboo houses afterward seen in the Siamese village at the World's Fair in Chicago. I wondered how any human beings could possibly content themselves in such a house and such a place for any length of time, little dreaming of the terrible tragedy connected with it. Picking up my fishing tackle and an empty 50lb. flour bag which I had brought with me for a container of my findings, I started for the other side.

I had barely crossed over the sand bluffs when a cloud of mosquitoes embraced me, which made a hasty retreat compulsory. For some time I did not know how to overcome this difficulty. To travel half a mile through an atmosphere every square inch of which seemed to contain thousands of mosquitoes was simply out of the question. I thought of the flour bag—a bright idea indeed. I drew the bag over my head, carefully tucked the ends under my coat, stuck my hands deeply into my pockets, and boldly faced the music. Music? well, I guess it was! It seemed as if my head was inside a beehive filled with millions of enraged bees, and each of them humming a different dirge in a different key. I could just see enough through the bag to keep the path, and the speed I developed in crossing the island was something wonderful. I reached the end without any mishap, and as soon as I got over the bluff on the Atlantic side the mosquitoes gave me a mournful farewell and retired to the jungle. It seems they drew the line about 200ft., more or less, from the salt water. I have never been molested by them when close to the surf.

It did not take me long to secure all the shells and sea beans I needed, and to fill out the day I captured a lot of small fiddlers, and baiting my hook I started out fishing. But it was labor lost. The fish were not hungry, or the bait was not the proper kind; at any rate there was no sport in it, and I gave it up. My return trip was easy; not a mosquito appeared. Great was my surprise and chagrin when I found my boat missing, and in its place a rickety old flatboat with a short piece of board in its place for a paddle. Here was a fine situation to be in! Would I have to paddle this old tub twelve miles with that rough piece of timber? I had fully made up my mind that some unprincipled individual had willfully, premeditately, and with malice aforethought, exchanged craft with me, and I was compelled to wriggle out of the dilemma as best I could. Just then I noticed a man coming out of the shanty previously described. To him I explained my plight: "I found my boat gone and that miserable old scow in its place; some scoundrel has played me a fine trick; how am I to get to St. Augustine in that thing?" "H'm! I reckon nobody exchanged boats with you, mister; that old mud-scow belongs to me, and there was no boat here when I came at 2 o'clock this afternoon. You landed here with low water, and your boat went out with the tide. You won't lose it though. I see you had it on the north side of the Divide, and it has gone toward St. Augustine. Let us look around the bend; we might find her on the bar."

Well, we found her, but not on the bar; the mast had got caught in some overhanging branches close to shore, and in a very short time we had her back to the original landing place.

How to get it back to the city in a dead calm I did not know, and I mentioned the fact to my companion. "Well," he said, "if a hammock in my shanty will do you, you are welcome to it. In the morning you are sure to get a good breeze to go home with."

I gladly accepted his hospitality, joined him in his scow, and during an hour's good fishing got pretty well acquainted with him. There was something mysterious about the man that aroused my curiosity, and his actions toward me indicated that he was well pleased with my company.

After supper we lit our pipes and several smudges, and sat down in front of the house facing the river, to pass away a few idle hours in contemplating the beauties of a Southern moonlight night and to listen to the mockingbird's songs. We had drifted into that delicious, dreamy condition which overcomes a tired person just before going to sleep, when suddenly the hooting of a distant owl came floating over the perfect calm of the night. Immediately my companion jumped to his feet, put his hands to his mouth and imitated the call to perfection. Again and again he repeated it, and the owl came nearer and nearer, and more hoots came from other directions. Suddenly a shadow flitted over the ground in front of me, and looking up I saw the bird lighting in the brush. This was indeed amusing, and I broke out in a laugh. "Hush," he said, "keep quiet; I'll give you a concert such as you never heard before in your life." And he did. The owls kept coming, singly and in pairs, until we were surrounded with them. There must have been several dozen, and the hooting was kept up incessantly. In the midst of this weird concert he related to me the following story:

"I formerly lived in Milwaukee; my wife had a sister come to visit us whom I had not met before. An affection sprung up between us that outrivaled the one between me and my wife. The result was an elopement; we never stopped until we reached this spot, built this shanty, cleared what little ground you see here, and were happy and contented until a year ago last May. One day a stranger came to the house and inquired of my sister-in-law where he could find me, stating that he had been informed at St. Augustine that I was acquainted with the river and knew all the good fishing points, and he desired to employ my services. I was fishing; she pointed me out to him and told him to go down to the edge of the river and hail me and I would come after him. She had no more than uttered the words when quick as a flash he had his hands upon her throat and was strangling her to death. Then he came to the river's edge and hailed me; I rowed over, took him in, and turning around to sit down I heard the report of a pistol. That is the last I remember. When I partially regained my senses I realized that I was badly hurt and I tried to remember what had happened, but I could not. I was covered with blood and I felt numb, and was breathing through a hole in my throat. I had not enough strength left to raise either my head or my arms, and soon I again lost consciousness. Several weeks elapsed before I found myself again among the living, and from then on I mended rapidly and was soon able to be about.

"Meanwhile the assassin had been captured and held in jail for trial. I was the main witness against him. He confessed and pleaded for mercy; the verdict was imprisonment for life at hard labor. My wife in Milwaukee was acquitted by the court, as there was not sufficient evidence to establish her connection with the crime.

"Now all I am telling you," he went on to say, "with the exception of what occurred in the short time it took to row across the river after he had called me until I heard the shot, is the murderer's own confession. After turning my back to him to sit down to row the first bullet struck me in the head and made me unconscious, the second penetrated my shoulder, and the next my neck. Then he dragged me out of the boat, beat the top of my head into a jelly with a large cluster of oysters, cut my throat from ear to ear, rolled me into the river and then left."

"Great heavens, man!" I exclaimed, the cold chills running up and down my spine, "what are you telling me? If you were not dead before he rolled you in the river, how did you escape drowning?"

"Oh, yes, it seems miraculous; but that was really my salvation. The salt water stopped the flow of blood and kept me from bleeding to death. My face was probably not under water at all, and as the tide was going out I was soon left on dry land. My neighbor, who lives two miles north of me, found me late that afternoon, and with the help of others I was taken to St. Augustine. Come in the house; I will show you the proofs of my story."

I followed him, he lit a candle and gave it to me to hold, then he took a red bandana handkerchief from around his neck and raised his beard. There was a ghastly scar from ear to ear, the bullet scars were there also, and the top of his head was a sight to behold. The evidence was too strong to doubt his words, and I asked in amazement:

"But what had you done to this man? What was his motive in doing all this?"

"Well, you see, he was after my wife in Milwaukee, and she had promised to marry him as soon as she had proofs of our deaths; that was all."

The owls had disappeared, the concert was over, and we retired. I put in a very restless night, and was glad to get an early start in the morning.

If any of the many readers of FOREST AND STREAM has ever met this man or heard his story, I would be thankful to him if he would kindly inform me, either through FOREST AND STREAM or by mail, whether or not it is an actual occurrence. O. VON HOLTZSCHUHERR.

II.

The FOREST AND STREAM cannot undertake to investigate all the yarns told its fishing friends by the light of the Florida moon, and punctuated by the hooting of howls; but in this particular instance we have sought to vindicate Mr. Holtzschuherr's responsibility. His relation was sent to Dr. DeWitt Webb, of St. Augustine, who has written as follows:

III.

"ST AUGUSTINE, Fla.—*Editor Forest and Stream:* The story is an o'er true tale, although strange to say I had never heard of it. The next day after the receipt of your letter I asked the man who drives for me, as we were riding, whether he knew about a tragedy that happened down the Matanzas River near the divide some twenty years ago. He said, yes, he knew all about it, and proceeded to tell the story substantially as your correspondent has it. The man's name was Keech, and he may be still living. The man who came so near killing him was named Newton, and was sent by Keech's wife from Milwaukee, she giving him the pistol with which to kill her husband. The evidence shows that the woman was shot in the back as she was standing before a glass combing her hair. I suppose she might have been choked afterward. Then when he had, as described, shot Keech and pounded his head to a jelly with a clump of oyster shells (and you know a clump of coon oysters would make an ugly weapon), he threw him in the edge of the water; and then wanting to make the job complete, turned him over and cut his throat. This brought his head out of the water, and the receding tide left him dry. The hemorrhage may have brought him out of his insensibility. Newton could easily have escaped if he had not stolen Keech's horse to ride away with; for, as he was passing George Carter's, Carter noticed the horse and went down to Keech's to find out about it, with the result of finding Keech in sorry plight.

"Newton was arrested and brought to St. Augustine for trial. Mrs. Keech was arrested at her home and brought to the State. Her lawyer fought for delay, so that Newton was tried and convicted before her trial, and on account of his confession was sentenced to imprisonment for life instead of being hanged. His conviction saved her, because as a convicted felon his evidence was worthless, and so she was acquitted.

"Another informant told me that Newton was shot while attempting to escape from confinement some years after. And strangest of all, he said that rumor had it that Keech, after leaving the neigborhood of St. Augustine, lived afterward with his wife in Jacksonville.

"How will all this do for a plain, unvarnished tale of love and blood? DEWITT WEBB."

Natural History.

THE WOODCOCK'S WHISTLE.

LOWELL, Mass.—I have read with much interest the articles from your many contributors concerning the whistle of the woodcock. I know very few men who have hunted this beautiful bird more than I have, covering a period of about thirty years, and while I have not yet learned all there is to know about this shy and mysterious creature, yet I have come into possession of many facts by close observation relating to his general habits and to others which are due to and contracted by change of locality.

I offer the above prelude to these few lines to show that, while differing from some of your correspondents, I feel a modest degree of assurance that many of my observations have been correct. If these few notes, covering so many years' observation about the woodcock's whistle, meet with the approval of the FOREST AND STREAM and its many readers, some time I might venture to air my views, which are due to observation, on some of the general and local habits of this singular bird, many of which are at the present time either in dispute or not generally known.

The young of the woodcock never whistle. I have seen and caught them during spring while following small brooks trout fishing, and have seen the mother bird early in the morning after a dark rainy night feeding her little ones. I have seen them when hardly able to fly, and when after a few yards of flight they would slowly sink to the ground, striking stones, sticks, trees or anything which might be in their way, just as young grouse do when learning to fly. I never saw a young bird that whistled.

The feathers on the wings grow out before they get strength to make rapid flights. When well along in the summer and the birds have grown strong of wing and are capable of swift flight, then like the old birds that can fly swiftly; they always whistle during rapid flight.

Most of your correspondents only recognize the fact that this bird whistles while rising. This goes far toward convincing me that most of them see him only when hunting, and that the less audible but distinct whistle which he makes during flight is overlooked or is not heard at all.

Many years ago, when mink pelts were worth $10, I used to put out my traps early in the spring before the ice was fairly out of the brooks, and often used to visit them at night, going over the whole line if the nights were on a big moon. Woodcock were frequently seen and heard, often flying so near that they would pass within an arm's length, and as they were all old birds at this season of the year, every one had his whistle with him, and was plainly heard, especially if the nights were without much wind.

During the summer months, while I have been in camp on the shore of lake or by the bank of some river, these birds have often been seen and heard while flying at night. Also when I was softly plying the paddle or fishing at night woodcock have passed so near that they could be reached with the paddle, and on nearly all of these occasions the

whistle, although not so loud as when rising in cover, was plainly and distinctly audible. Later still in the summer, after the family has grown up, they are in moulting, and if my observations have been correct do not fly or move around either by day or night so much as at other seasons of the year, but still he has his whistle with him then when in full motion.

Some twenty years ago, while I was hake fishing during a foggy October night off Wood Island Light, in Saco Bay, a woodcock paid us a visit, alighting on the deck of our smack. He immediately took flight again, but flew around and among our rigging several times, as though loath to leave a place that afforded a chance to alight. The night was still, and we could follow his course plainly by his soft, low whistle.

In my hunting this bird during many years hundreds of opportunities have presented themselves to hear the whistle other than when rising, a few of which I will relate. Once while hunting with the late Newell Abare, as true a sportsman as ever trod a cover, a woodcock was wounded badly by being shot in the head; in fact, the under mandible of his bill was broken nearly off at the base and was hanging. The bird seemed to lose his reason, and flew around back and forth over the cover in large circles, something like the manner of a bat. Sometimes he would come almost within the length of our gun to us, then he would work off at a distance, only to come back again. Curiously we stood and watched his singular flight. At all times when near his whistle was distinctly audible. I also noticed that in turning sharply, or when struggling for a greater height, the whistle varied by being louder. After viewing for a number of minutes this freaky and singular flight, I again shot, and ended the instructive exhibition.

Many times wounded birds have come to hand that were not wing-broken, and frequently have been held by the feet and allowed to beat their wings as in flight. On all such occasions the whistle was all right, and was in good condition so long as the wing beats lasted. The same birds have also been held firmly by the head and bill, and, like the other cases, so long as the wing beats were maintained vigorously his whistle was in the best of order.

When rising in tall cover and in much haste, as is usually the case when alarmed, his wing beats are quick and powerful, and the whistle which we all love so well is clear and sharp. After gaining the top of the cover and good headway, it softens down to a much lower key, and is heard best on still days or when a bird passes near by you.

Did any hunter ever hear a cock whistle when the notes were not in perfect time with his beating wings?

On one occasion, while hunting with a young friend, at the signal for a point I went over to where he stood, and he pointed at a cock only a few feet before the dog's nose. He wished to catch him alive, and while I stood guard in case of a flush, he laid down his gun and dropping on his knees plunged suddenly forward, and covered with both hands the much surprised woodcock. The many experiments that were tried, all of which bore a large crop of whistling in the best of condition, and all coming from his beating wings, would have satisfied any one. I could give many more cases, but I think that I have stolen from the leaves of my memory sufficient to account for the faith that is in me as to how and when the woodcock makes the air vibrate with the many varied notes of his tremulous whistle.

INTERCOMMUNICATION OF ANIMALS.

I HAVE read with interest the article by Ernest E. Thompson on "Intercommunication of Wolves," in your issue of Jan. 23. His statements regarding the odors of different animals, and that the odor of the same animal differs under different conditions, are all correct, and what all intelligent hunters have known for generations.

Signal Posts.

In regard to the amount of information which animals obtain from what he calls "signal posts," many of us would differ. These so-called "signal posts" are some prominent object, either a rock, bush, stump or mound near a game trail, or if in winter on the ice or shore of a pond or stream. No doubt wolves, foxes, dogs and other animals can tell by the scent where animals of their own species have been, whether they were friends or foes; of what sex and whether searching for a mate; but I doubt if they can tell much more by the scent left on these "signal posts." If they can tell where they came from and which way they were traveling, it is by smelling of the track and not by the scent left on the post. Of course the animal last at the post left his track, and, as Mr. Thompson states, any animal can tell which way a track leads. Going to the post, he finds the track, and gets his idea of whence the animal came and where he is going from the track and not from the scent on the post.

Animals do not find places entirely by scent, although in many cases the scent helps them locate the exact place more easily. In proof of this, set up a bush which you know to be perfectly clean on the ice near where foxes travel. The first fox which passes will go to it, after that any other fox will follow, but the first fox will go by sight because he expects to find that others have been there. Wolves do the same, and many a one has found the poison and met his death by investigating a "sign post" where no wolves had never been before.

All animals know where animals of their own kind will travel, and one who has hunted any animal a long time will get so that he in a measure partakes of the instinct of the animal he hunts, and can tell very nearly where it will travel and where to look for signs of it. Any good otter hunter canoeing on a strange stream can at once point out many places where otter slides will be found before he lands, and on lakes or ponds can locate them when long distances away. Any good mink hunter can tell you places where every mink will surely visit, even on streams he has never seen before. Those who hunt deer or foxes with hounds know that the runway where they ran fifty years ago, if left just as it formerly was, is the place where they will run to-day. I always judge that animals know as much about their own concerns as men do; and that what a man can find without scent an animal can.

Bears leave signs by biting prominent trees, usually near old roads or game trails. Every bear which passes leaves his mark. I know that they can tell where a bear has lately passed and how high he could reach (unless they cheat by standing on a log, as I have seen done), but I doubt if they find out more except by following the track. Squirrels and some animals of the cat kind leave their signs by scratching trees or logs of rotten wood. Fisher and marten will leave sign on prominent logs and rocks, but I believe that all this communication only tells that the animal has been there, with perhaps the sex and condition. The real communication is in an entirely different way, and one to us as yet unknown.

Animals, Traps and Trappers.

Mr. Thompson speaks of wolves learning about traps and poison, and teaching others. This is correct. Most animals (and in this term I mean to include not only beasts, but birds, fishes, reptiles and also insects) learn to know and shun, and teach others to shun danger. There are exceptions, as in the case of Canada and Franklin's grouse, but this is the general rule. The bear of to-day can only in rare instances be caught in the same way in which he could be fifty years ago in places where he has been trapped. For many years he has known enough to tear down the sides of the house around the steel trap, and in some cases to take hold of the clay and haul the trap out of the house. A bear which is well educated can discount any wolf ever born in the tricks he can teach a trapper. Many can now be taken only by setting the traps in water with scent, as is practiced in setting for foxes. Most fishers know enough to trip a log trap and steal the bait. Any one who tries to trap the common house rat will find that, although he may have a college education, he has still a good many things to learn. Fish learn to avoid nets. In Solomon's days he found that it was "in vain to set the net in the sight of any bird." Where mosquitoes are persistently hunted they learn to alight on dark objects to escape being seen.

Where telegraph lines have been long used, birds have learned to avoid them. As "dead men tell no tales," it is reasonable to suppose that all kinds of animated life (unless we except men) learn by the experience of others. The young ruffed grouse begins life where his parents left off. City nighthawks learn to use gravel roofs, and chimney swifts to use chimneys instead of hollow trees. But all these are only examples of learning from or communication with each other by scent, example or teaching.

Migrations of Bears.

There are ways of communication which are far more wonderful. While birds migrate at regular seasons, and from well-known causes, in their usual spring and fall migrations many animals, and some birds, migrate at irregular intervals over great extents of country and from no known cause. Take our black bears for an example. The first notice of one of these migrations is to be found in a book by John Josselyn, entitled "New England Rarities Discovered," published in 1673. In this he says (I have to quote from memory, not having the book at hand) that where he lived at York, Me., the bears sometimes traveled in great companies and crossed the river (probably the Piscataqua River) in large numbers.

The next migration of bears of which I have any sure proof was witnessed by my father some seventy years ago. Early in September a very large number of bears came to the east bank of the Penobscot River, in the town of Orrington, some seven miles below Bangor. The night was so dark that they could not be seen, but they could be heard calling to and answering each other, till just low water, when they took the water and landed on the Hampden side. In the morning it was found by the muddy tracks that a large number had crossed. My father saw three tracks across a single plank in a shipyard. Although a large body of men searched all day, none were seen, as they had kept straight on, traveling west.

Although my father, being a fur buyer, would have been likely to have learned if there had been other migrations, we heard of none till about thirty years ago, when an old hunting friend of mine, Mr. Henry Clapp, who is quoted in the article on bears in Cassino's "Standard Natural History," told me on his return from a hunt that he set out his traps in the fall, but found few bears till on going out one morning in November, after it had snowed the night before, it looked as if the country was full of bears. He counted the tracks of nine different bears, all going up one narrow valley. They kept coming for some days, all traveling from east to west, and not making any stop till it came time to den. He had his traps out very early the next spring, but as soon as those near by came out of the dens they at once resumed their march westward. Others followed from the east for a few days, and then there were no bears left in the county. If in either case any of these bears ever returned, it was in such scattered parties that no one was ever aware of it. Although I have bought bear skins by the thousand, and have always inquired of all the hunters, I have never known of any general migration since, although bears, like other animals, often move over small spaces of country in search of food. In both of these cases lack of food did not seem to be the reason for moving.

Migrations of Other Animals.

When I was a small boy, or over fifty years ago, the caribou were often seen in droves of fifty or more on Chemo Bog, only some fourteen miles east of Bangor. In a few years they all left, and not a caribou was left in Maine. For a good many years not a single one was known to be taken. In the falls of 1857, '58 and '59 I spent months in traveling over a large part of northern Maine, but never saw a caribou track, nor heard of one being seen. I heard of a few caribou being taken in 1860 and '61, and in a few years they became quite plenty. When they migrated it was said that they went east. It is quite certain that those coming back in 1860 and '61 came either from the north or northwest.

Lynx were so abundant that several hundred skins were sold in this market every year till about the last of the war, when in a short time all had left, so that not a single skin was offered for several years. Then they returned in such numbers that within a few years after the first came I was buying some 200 yearly. Red squirrels also frequently emigrate from east to west. I once in September counted ten red squirrels in the course of half a day's paddling, which were either swimming or out on leaning maples, and just entering the water, and which were all going west. I have also known foxes and rabbits, fisher and marten, almost entirely to leave a large tract of country in a very short time. In most or all of these cases there was no lack of food. I have known foxes in great numbers to appear suddenly. I once bought over 600, all taken within less than six months on a space less than ten miles by twenty. One farmer took sixty-five near his home. When the season closed they were said to be as plenty as ever.

In the same way some kinds of birds, notably owls, will all at once leave a large extent of country as if by a preconcerted arrangement, and all go in one direction. Some years the snowy owls come down from the north in great numbers all along the line from Maine to Dakota. In other years the hawk owls come, and a few years ago we had a great flight of the great gray owls, and a bird which had been so rare that previously I know of the record of but a single one ever being taken in Maine suddenly became abundant. The fact that the snowy and great gray owls, which feed on the same food, did not come in the same year, would indicate that food was not what they emigrated for, and in dissecting at least twenty snowy owls I found that all were in good condition. I have also known ruffed grouse and Canada grouse to migrate in large numbers, and as they subsist on entirely different kinds of food, and both can get all they need anywhere in the State, the lack of food certainly was not the cause of their coming.

I could also cite numerous instances of fish and insects, like locusts, grasshoppers, ants, caterpillars and others, all moved by a common impulse, moving over great distances and all going in the same direction.

These facts prove that animals of all kinds do by some means communicate over immense distances both of land and sea, and where there is no possibility that any individual can ever see others of its kind or see any sign to indicate that such a movement was contemplated. This is not only the case in America, but in all other countries, of which the migrations of lemmings in Europe is a striking example.

Warnings of Danger.

But besides this there is a communicating to move to escape danger or to go to new breeding grounds. Dr. Livingstone, whom every one who has read his writings will acknowledge both a close and scientific observer, and whose statements are reliable, says of antelope: "Have they a guardian spirit over them? I have repeatedly observed when I approached a herd lying beyond an ant hill with a tree on it, and viewed them with the greatest caution, they very soon showed symptoms of uneasiness. They did not snuff danger in the wind, for I was to the leeward of them; but the almost invariable apprehension of danger which arose, while unconscious of the direction in which it lay, made me wonder whether each had what the ancient physicians thought we all possessed—an archon, or presiding spirit." Those who have watched wild ducks much must have noticed the same thing. Whole flocks will begin to be uneasy and quit feeding when there is no chance to either see, hear or smell the danger.

There is positive proof that when a whale has been struck every whale within the range of a spy-glass will at once turn flukes, being in some way notified of danger in a second's time over a great extent of water. I have often seen every porpoise in sight go down as if by one motion when one was killed, and all those which were under water when they rose only gave a single short, sharp puff instead of the three slow long puffs which they usually give.

It is a matter of record that plover—and in some places ducks—when they have been shot at for years at points where they usually passed in their migrations, have changed their flight lines and made new paths through the air, which every flock followed. It is also well known that sperm whales, from being hunted, left their old grounds and sought new and remote places. Porgies also entirely left the Maine coast for years on account of being netted so persistently. Dr. Nansen tells us that on his voyage in a sealer to the south of Greenland the herds of seals all lay on the outer edge of the pack to escape the ice bears; but when he returned some years later to make his trip of exploration across Greenland, and was working his way in boats through the pack to land on the south end of Greenland, he found that the seals, from being hunted, had changed their grounds and were now on the inner edge of the pack, having concluded that the bears were less dangerous than men.

Now in all the cases cited these animals must have in some way communicated with others not only that there was danger to be avoided, but must have made each other understand the exact direction to be taken to avoid it.

If any one needs further proof that animals can communicate about meeting at a certain point at a long distance off which they have never seen, I will quote from A. Conan Doyle on page 464 of *McClure's* for March, 1897 (italics mine): "For breeding purposes the seals all come together at a *variable* spot, which is evidently *prearranged* among them, and as this place may be anywhere within many hundreds of miles of floating ice, it is no easy matter for the fisher to find it. The means by which he sets about it are simple, but ingenious. As the ship makes its way through the loose ice streams, a school of seals is observed traveling through the water. Their direction is carefully taken by compass, and marked on the chart. An hour afterward perhaps another school is seen. This also is marked. When these bearings have been taken several times, the various lines upon the chart are prolonged until they intersect. At this point, or near it, it is likely that the main pack of the seals will be found."

Now here is what seems to be positive proof of great numbers of animals, scattered over vast expanses, all being moved to meet at a certain well-understood point, which very few if any of them have ever seen. As it is an impossibility that any one of this vast multitude could a year beforehand have been notified by any "walking delegate" of the time and place of meeting, and certainly there can be no landmarks or "sign posts" in all this wilderness of moving ice to guide those coming from different directions to a given point, the only other reasonable explanation seems to be that in some way they are influenced by some kind of mental telegraphy, to which our nearest approach at present is telegraphing without a wire. If there is such an influence exerted in any way, then another mystery is as to whence it proceeds. Solomon says: "The locusts have no king, yet they go forth in bands." All these various kinds of animal life seem to have no leaders, but they all move at once in one direction, as if acting under the influence of one mind. I have stated the simple facts and leave it for others to theorize.

Game Bag and Gun.

HOURS IN A BLIND.—II.

When Birds Came.

As I stood there watching the live decoys enjoy the water and their freedom from the coop, I heard John call "Mark to the east," and turning saw a single bird coming low over the marsh. Gently lowering my body until my head was hidden by the cane which formed the blind, I watched the simple bird's approach. John had given utterance to vigorous quacks, which had caught the bird's ear, and it had seen the decoys and was flying toward them. While it was still 100yds. distant the old drake saw it and saluted, and the ducks lifted up their voices in sonorous calls. This was too much for the lone black duck. He passed outside the decoys, well beyond gunshot, swung up into the wind, turned back, and with lowered flight and down-bent neck surveyed the decoys and prepared to alight. He swung over the live ducks and up toward the drake, and I jumped up, put the gun on him and pulled. Bang went the first barrel and bang the second; the duck climbed and climbed, and kept climbing; Gunner tore through the cane to see what had fallen and to bring in the bird; John made no comment and I said nothing either, though I had missed a shot that a ten-year-old boy ought to have killed.

I knew why I had missed the bird, though not how. I had let him get too far over the decoys and past me, and had shot at him when he was going away, and failing to allow for the velocity of his flight, had shot behind him. So my first shot for the season was a disgraceful miss.

I do not know how other men feel about missing, especially about missing easy shots, but it plunges me into an abyss of shame and mortification from which I do not easily emerge. At the best of times I am a very bad shot, and often my missing makes me declare that I will give up shooting altogether. When, however, the time comes for me to get an outing again, I forget all about my past misses and start forth as hopeful and as free from anxiety about missing as if I were a good shot instead of being a villainously bad one. So I mourned over this miss, and felt horribly ashamed that John, and even that Gunner, had been witnesses of my disgrace.

As I sat there thinking of this John whispered, "Mark behind," and, turning my head, I saw a pair of mallards—a big greenhead and a duck—almost over me. To grasp my gun and throw it to my shoulder seemed but a second's work; but in a second a duck can go a long way, especially down wind, and by the time the muzzle of my gun was pointed in the birds' general direction they had passed over us and were far beyond the decoys.

In desperation I fired both barrels, and again I heard Gunner rush to the water's edge, saw him look in vain for something to bring in, and saw the ducks like a pair of disjointed parentheses melt into the gray sky and disappear.

"Those two came badly, sir," ventured John. "Yes, they came badly," I replied, "but we ought to have been looking out for them."

Some little time elapsed without any further excitement, when suddenly—although we thought that we had been making good use of our eyes—a duck appeared quite close to the decoys, coming in as gently as one could wish. I very slowly bent to get my gun, resolved that this time, if it came, I would retrieve myself. On the bird came, looking only at the decoys; I rose up slowly, but he saw me and flared. I followed him, but gave the gun a little too much swing, and shot over him. Another miss.

Again despair seized me; and when a little later I missed an easy double at a pair of sprigs, which were alighting among the decoys, it tightened its grip. John said never a word in comment, nor did I. The trouble was too deep for words.

It is astonishing how much room there is in the air around a duck. I have seen the time when the birds were so thick in the air that it seemed as if it would be impossible to shoot a charge of shot through them without killing one or more, but how very easy it is to spare their lives. After a few more misses John seemed to feel that I stood in need of comfort and consolation, and ventured the remark that there must be something the matter with my cartridges. I was shooting wood powder, and he asked if the shells were not old ones. They were old; but I knew very well that if the gun was held right the cartridges would do their work well enough, and—though I say it myself—I was too honest to attempt to excuse my lack of skill on the plea of poor ammunition.

It was not until after lunch that I got my first bird. John and I had both become careless about looking out, for it seemed useless to see the birds, as I could not hit them. Suddenly a big black duck cut across the head of the decoys, and, not seeing it until it had got by, I threw up my gun and took a snap shot at it, and killed it dead. It fell on the edge of the marsh and Gunner brought it with much pride. John too was delighted, and assured me that the shot was a good one and that I was getting onto them now. I shook my head wearily, for I knew what an accident this success had been. Still I presume that I was unconsciously a little bit encouraged. At all events, we both kept a better lookout, and a little later, when three widgeons came by over the decoys, but not lowering to them, I doubled on a pair with the right barrel and killed the third with my left. This was a little better, of course, but still it did not give me much courage. A little later, however, when a pair of mallards came up the wind high up, and I killed both, I began to take heart and really to feel as if perhaps I could do something. The conceit was quickly taken out of me, however, by three widgeons, which stole in and alighted among the decoys unseen. These I missed on the water with the first barrel, and on the wing when they flew. They were not 25yds. from me.

It was still early in the day—only 2 o'clock—and there was time yet to kill a lot of birds if they kept coming and—if I could only hit them. But there did not seem to be much chance of my doing that. John was encouraging, however, and regaled me with anecdotes of the numbers of birds that certain men whom he had accompanied had killed in the afternoon; and especially of one who only a few weeks before, after a day of very bad luck, had in an hour's shooting just before sunset run his score up to over thirty. I anticipated no such good luck, but I determined to endeavor to use greater care in shooting; to take my birds earlier, to hold further ahead of them, and not to shoot unless I felt reasonably sure that I was holding on each bird about as I thought I ought to.

Meditating thus, I was watching the sky to the south and east, when suddenly I heard from John the grating call of the canvasback, followed by several loud honks, and sitting down I strained my eyes to see where the birds were to which he was calling. Peering through the stalks of the cane, I presently saw off to the right a single canvasback coming with the steady flight that distinguishes these birds from almost any other ducks. He was an old male, white and handsome, and was headed straight for the decoys. John continued to call, and the bird had evidently made up his mind to come. We had a few canvasback decoys out, and these with the geese were more likely to bring him; for, as is well known, canvasbacks will stool to geese as well as they will to their own kind. He came on swiftly and steadily, and at length, just as he was over the tail decoys, I arose, held about 2ft. in front of his bill and fired, and the noble bird fell. He had hardly struck the water before Gunner had plunged in, swam through the decoys and seized him, and in a few moments he was in my hand, and I was smoothing out his plumage and admiring the rich coloring of his head and neck, and the wonderful delicacy of his back plumage.

"Mark in front, high up," said John, before I had finished looking at the canvas. High up in the sky to the south of us I saw a pair of black ducks, which, in response to John's vigorous calls, and to the invitation offered by the live ducks, rapidly lowered their flight, took a quarter circle to the west, and then coming down to about 6ft. above the water flew confidently on toward the blind, one about 2ft. behind the other. I waited till they were over the last of the decoys, rose to my feet, and killed the first and then the second in capital style. They did not see me and never knew what had hit them. This was cheering.

From this time on until it was time to take up I shot fairly well—very well for me—and at night when we returned to the house I had twenty-two ducks, and believed that I had in some small measure effaced the feeling of contempt that John—and Gunner—must have for me.

I had other hours in the blind during my trip, and in some of them I did better than on this first day; in none worse so far as missing went, though often I came in with a less number of birds.

Men of the Marsh.

Now and then, while we were sitting in the blind, John and I would be joined by one of the club watchmen, whose time is devoted to patrolling the marshes, driving off poachers, preventing night shooting, and generally doing all in their power to preserve the shooting. These men are farmers in summer time, but during the winter are glad to earn what they can by watching the marshes; for this is a steady job, which pays much better than fishing or gunning. They are most of them old gunners, familiar from childhood with these waters and their islands, and with all the ways of the wildfowl. Constantly on the marsh and on the water, they know just where the ducks are "using," and what are likely to be the best shooting points on any given day. They are thus always consulted by the men who are going to shoot on the marshes under their charge, and their advice is usually taken.

The life of these watchmen is a lonely one. For six days in the week they live on the marshes in little houses built for them in the fall, but on Saturday afternoons they report at the club and then go to the mainland to spend Sunday with their families. Leading such a life, the watchman is delighted when one of the club members comes to shoot on the marsh under his charge, and often he spends most of the day with the gunner, helping his boatman to tie out and take up, assisting in retrieving the birds killed, and during the quiet times sitting in the cane with the boatman and gossiping. Some of them are silent men, but others are great talkers.

The subjects which the two discuss are varied. Of course the ducks and their actions are a fruitful theme, but home matters claim a good share of attention; the recent social events on the mainland, the last sermon of the circuit rider; farming, past and future; marriages, sickness and deaths.

I heard one of them tell John a story which will perhaps bear repeating. He said:

"I never knew tell the other day that coons went fishing."

"Why, of co'se they do," said John; "they mostly live on fish and crabs."

"No, that ain't what I mean. I mean fishing with a hook and line. The other day I was going up a little lead and I come to a bend, going slow and quiet, so's to see if they wus any ducks sitting in there. Just as I looked over the p'int I see an old coon a little ahead of me runnin' round on the beach this away and that away, like he was plum' crazy, and waving his paws. I watched him a little to see what he'd do, and pretty soon I see he was working around a little pool that had some minnies into it, and pretty soon he druv 'em up into a corner and he made a rush and swep' a lot of 'em ashore with his paws. I expected now to see him eat 'em, but he didn't; he just put 'em up where they couldn't get back to the water, and then he took one and trotted down to the water again. When he got there he stopped and looked about a little. When he found a place to suit him he stuck the minnie on one of his sharp claws and held that foot in the water. Pretty soon I saw from the way he acted that a fish was biting at the bait, and in a minute the coon jerked his paw out of the water and threw a little fatback out on the bank. He ran to it, carried it upon the marsh, and put it on a little patch of grass, and then went back and baited his claw with another minnie. Then he caught another fatback and put it up with the first one and then went on fishing again. He kept this up until he had caught quite a number, and at last when he carried a fish to where the others was lyin' on the grass he set up and put his hands on his knees and looked at the pile of fatbacks, and seemed to be studyin'. Then he laughed right out and said: 'Ha, ha, ha! seven. Enough for supper.' That made me laugh out loud, and the coon grabbed up his fish and run off in the marsh.'

"Huh!" said John. "Expect me to believe that?"

The lives of these marsh men are monotonous. The watchman rises with the dawn, and as soon as it is light clambers up to his post of observation—the roof of his house. This is only a one-story shanty, but standing here he can see over the cane which surrounds him and can look down into the larger bays, ponds and creeks which are within his jurisdiction. He can see if birds are sitting in these waters, and whether any are flying, and easily gets a notion of what is taking place in all the neighboring marshes. Day after day he watches the ducks, studying their habits and learning their ways, and no one can give better advice to the gunner as to where he should tie out.

Now and then a bit of excitement comes into the watchman's life, but it is excitement of a kind that he does not like. It is given in doses too strong for enjoyment. Occasionally the marshes are invaded by night shooters, who—with or without a light—scull up to rafts of sleeping ducks or geese and shoot them on the water, creating havoc in their close-packed ranks. When this occurs the watchman sallies out in his light skiff, and, knowing all the leads and short cuts, he usually has no difficulty in coming up with the poachers, whom he tries to drive away. On two or three occasions watchmen have been shot at by these gentry, though no one has ever been injured in this way. Several, however, have been badly frightened, and more than one has given up his berth under the stress of such a scare. Others, more courageous and wiser, put a bold face on the matter and give back threat for threat. Such persons the poachers speedily retreat from and avoid in future, for your true poacher is not a courageous animal. He does not enjoy a fight. Since the shootings that have recently taken place on these marshes the watchmen have taken to carrying shotguns and rifles about with them at night, and in the future the night shooters may expect a little shooting from the other boat.

Besides his work of guarding and patrolling, the watchman has little to occupy his time. Of course he does his own cooking, dish washing, wood chopping, and so on, and now and then he may be obliged to make a journey to the mainland for wood or water or provisions; but still he has plenty of idle time on his hands. Often he employs a part of this in trapping the minks, muskrats and coons which abound on the stands. The few skins that he may get he sells at the store, and the cash which he is paid for these goes a little way toward helping out the family living, or perhaps toward the expenses of next spring's farming operations.

Certainly these men are not the least interesting of the inhabitants of the marsh. COUPLES.

THE FOREST RESERVES.

Editor Forest and Stream:

It has been so uniformly my custom ever since your paper was founded to indorse the opinions of the editorial department in matters within the scope of its columns that to call up for question one of your paragraphs at this time creates for me a novel experience. But your editorial in the issue of Feb. 27 lauding the action of ex-President Cleveland and the report or findings of a forestry commission, by which vast areas of the public domain in the Northwest have been segregated and set aside—including several millions of acres in the State of Washington—as forest reserves, moves me to ask how such action of the executive will, to quote your words, "be of incalculable benefit to the Western country?"

The millions of acres included in the so-called Washington Forest Reserve and the Olympia Forest Reservation, while they include portions of the densely wooded foothills and slopes of the Cascade and Olympic ranges, also include the rock-ribbed sides, gulches and treeless summits of these mountains that are rich in mineral deposits. All of the rich minerals, including valuable quarry stone, abound in the country which a commission of experts say should be closed to the mechanic arts. Probably more than half of the land situated in this State that is included in this "forest" reservation, and thereby withdrawn from entry, is entirely destitute of merchantable timber, and contains at best a scrub growth fit only for mining purposes as fuel, while a large portion is a treeless, snow-covered region.

When I came to Washington a few years ago to make my home in the Pacific Northwest, I soon learned that the present as well as future development and wealth of this section of the United States depended largely on its timber and mineral resources, and I made an effort to become acquainted with some of the lands that are now embraced in the reservation order. Therefore in this connection permit me to say that capital has come freely into this State, seeking investment in the development of the mineral as well as timber values lying within the proscribed districts. Thousands of prospectors have located claims within their borders, and a large number of claim-holders have spent time and money, and risked life and health, in prospecting and in prosecuting assessment work necessary to secure patents from the Government to perfect their titles. To-day hundreds of men are threading the cañons of the Cascades and Olympics, defying the dreaded avalanches of snow incident to this time of year, prospecting for the precious metals, some of whom are struggling with poverty or meager "grub stakes," while others are backed by the liberal hand of moneyed capital.

The late act of the President will seriously embarrass the existing situation of affairs and check further development. Capital will become frightened into abandoning enterprises already entered into, and will seek other countries, where experts in forestry do not erect Chinese walls around mineral belts. The homes of hundreds of settlers are practically withdrawn, and all future settlement therein discouraged. Roads, mills, camps, trading posts, and all the means of developing a country rich in natural wealth are virtually prohibited, so far as the exercise of any liberties therein is concerned, notwithstanding the members of a forestry commission have reported their examination of the situation and recommended that the reservations will be beneficial.

Looking at the matter from the standpoint of a resident of the State from which this enormous area of valuable land is withdrawn from entry and practical use, permit me to ask you on what hypothesis you base your belief that the sweeping order of the President will redound to the incalculable benefit of the Western country? CAYUGA.

EVERETT, Washington.

[Our comments are given elsewhere.]

Manitoba Deer and Lumber Camps.

THE provincial authorities are determined to enforce the newly enacted law prohibiting the killing of deer in the Province for a period of two years. Last Wednesday Constable Cox made a raid upon a camp of hunters, who felt themselves secure when in the depths of the Riding Mountains, and arrested three men who have been in that country since last fall, and during that time, it is charged, have killed many animals. The heads and hides of the elk and moose were thrown out upon the snow to rot. Numbers of these were found by Constable Cox scattered about the bush. The meat was used for food and, it is thought, sold to lumber camps. The trio were somewnat surprised when Constable Cox dropped in upon them before breakfast, catching them with a supply of the meat on hand. The offenders were taken to Dauphin, where they appeared before Magistrate Smith, and were fined $50 and costs. Two of them were unable to pay, and were taken to Brandon jail to serve out a sentence of two months.—*Winnipeg Free Press.*

DECOY STORIES.—III.

GUILFORD, Conn., March 6.—*Editor Forest and Stream:* Your correspondent Melville Church, who writes in your issue of Feb. 20 in regard to an eagle trying to carry off one of his wooden decoy ducks on Thanksgiving Day, puts me in mind of an incident of a similar nature which occurred to me one afternoon in the latter part of October. I took a half dozen black duck decoys of wood, placed them in a salt hole out in the meadow back of the beach, and as the wind was blowing strong from the south, which would drive the ducks in from the Sound, I took my position back of a small bunch of beach plum bushes which I had stuck up in the meadow about six roods from the salt hole. The ducks did not come in as I had expected, but I watched until almost dark, when I saw quite a large bird coming over the beach straight for the salt hole; he hovered over the decoys for a moment, then down he came, grabbed one of the decoys and started off. Now I had no idea of losing my decoy in that way, and brought gun to shoulder in short order, and a half minute later I was hauling the decoy and bird ashore. It proved to be a large gray owl, what is called here the horned owl. I hope this will reach the eye of Mr. Church, for I think it will make him feel better. M. D. STEVENS.

LIFE AMONG THE LUMBERMEN.—I.

ASHLAND, Wis., Jan. 24.—"We haul no logs to-day. Dat snow come more like he spill out of the sky."

So spoke Ernest as he stamped the snow from his feet in that little old camp in the wilderness just sixteen years ago to-day. On the deacon-seat by the old heater I was pulling on my shoe-packs, ready for a long day in the pines. The cook came down the row of bunks, calling in no gentle voice: "Roll out! roll out!" emphasizing the call by shaking or pulling the extended feet of said occupants, whereat said occupants slowly changed ends, and crawling out of their warm beds with eyes still heavy with sleep felt for their footgear. The extent of their talk was a smothered *sacre* from a Frenchman and a *mavel* from a Swede—swear words of the different nationalities being the only speech heard.

The boss sat on the end of the seat next the cook's apartment quietly smoking. As I passed him on the way to the "wash sink" he caught me by the belt and pulled me to the seat beside him. "George," he said, "there's the devil to pay. The snow was too deep before to work the timber we are in, and now comes another snow of 18in. in a night. We'll have to quit that ridge, that's all; and go down near the river to some thick clumps, which I will cruise out as soon as I get time. But that isn't all. The cook tells me we are practically out of flour and meat. The tote train is due here to-morrow noon; but they'll never get here without help. We are the furthest camp up on the river, and I am going to take Jake with his four horses and narrow sled and start to meet them just as soon as we have breakfast. I'm going to leave you in charge. If it clears up, go out to the works with the loading team and bring in the tools. You won't starve; there is plenty of corn and oats ground together for horse feed, and the cook can keep you alive on that."

As he finished speaking the low door opened, and the teamsters came in, Jake in the lead, Kronquish in the rear. With them came a breath from the outer world, a little whirlwind of snow. "Whew!" said Jake, "worst storm I ever seen;" and he continued in a low, grumbling tone: "hard three-trip road anyway; and now the skidways are all buried, the cross-hauls and go-devil roads all filled up, it's going to be tough the rest of the winter."

Just then the cook called out, "Take it," and we all dropped into place around the table. With the exception of Ernest's chatter the meal was eaten in silence and quickly. The boss rising first said quietly to Jake, "Jake, put your team on the tote sled." Half an hour later the gloom of the tote-road swallowed them up, while yet no sign of daylight appeared. The crew, with the exception of Ernest and myself, crept into their bunks again, and were instantly sound asleep. Slowly daylight peered through the single light of glass over the door. Slowly the candle on the end of the table burned into the socket, fluttered and went out, at which I was forced to close the book I was reading; noting that day was at hand, I stepped out to see about the weather. It was, as Ernest had said, as though the snow was literally spilled out of the sky. It came in chunks, compact and hard, and struck the face with sufficient force to make the skin tingle.

"What will we do, Ernest? We are all but out of grub, and time will move slowly until they get more supplies in here. If we only had some ammunition we could get deer and plenty of partridges and spruce hens, but the cook shot away all the powder and shot last fall, and all the shells for the Winchester."

"*Bien*, we see. The cook he have a little powder left; I chew some tea lead and make some bullet, then we get a deer; we get him to-day, you see."

An hour later we were dragging slowly along the logging road in the direction of the "works." Arriving at last where the last trees had been felled the night before, we found numerous deer signs, where they fed on the small maples and ironwood that had been broken down by the tops of the pines in their fall. "Now," said Ernest, "we chop down maple; de deer hear him when he fall; then we keep still; maybe leetle while, maybe long time; de deer come eat de top; then we shot him."

We soon had a tree about 10in. in diameter smashing down among the alders at the edge of the swamp. Then we dug down beside and about midway the trunk, and spreading some pine boughs on the floor of our ambush settled down to wait.

I was fairly paralyzed with the cold, Ernest having placed a strict embargo on any movement whatever; and we were fairly buried in fast falling snow when Ernest whispered, "Listen! now I hear stick crack! Deer come sure."

A moment later out of the gloom of the swamp there appeared one, then two, deer, followed by two more. They came straight for the tree top, and almost before I had fairly noted the number the leader was within 20ft. Ernest poked the gun over the edge of the snow fort, there was a report, and I was scrambling along the tree trunk to where a stricken deer was floundering in the snow. It was a big doe and was dead before I reached her. "Ha, ha," said Ernest, "dem feller sleep in camp eat horse feed. We have meat for supper. We be plenty hungry too when we get camp."

Already the early twilight was falling, and by the time we had wallowed out to the logging road, dragging our deer, night was fairly upon us. We were likely to be, as Ernest said, plenty hungry before we reached camp, and to say truth I had in imagination eaten almost the whole of that deer before we finally came within sight of the rough comfort of the interior and heard the steak sizzling in the frying pan, while the cook, delighted with our success, sang as he sliced the coarse bread for our supper and did a bit of a dance on one of the smoother planks of the floor. Then with a few deft movements he placed a steaming heap of steak before us and we did eat. How the memory of that meal comes back to me. Your dwellers in cities, buried in piles of stone and brick and steel, with tables spread with everything good for food, will never know the sweet pleasure of eating until they have earned the meal to be eaten by a hard day's hunt, even though the meal so earned be corn and oatmeal bread and venison steaks. After supper the pipe, then oblivion; and as the sense of perfect relaxation and rest swept over me, the cook's voice sounded low and sweet as he sang, while rattling the knives and forks in the dishpan:

"Oh, remember the valley you're leaving,
How lonely and dreary 'twill be;
And remember the sad heart you're breaking,
And be true to your promise to me."

G. W. M.

[TO BE CONTINUED.]

DAKOTA SCREENINGS.

STRICTLY speaking, among screenings some grain should be found. It is doubtful if there is any wheat in this. I have been watching several jack rabbits start off trying to determine which hindleg they were lame in, but until I used my horse judging rule for lameness I could not decide. To tell which foot a horse is lame in watch carefully and pick your foot; it is always the other foot that is hurt. This works great on jacks.

Half-breeds as Hunters.

The North Dakota half-breeds are good sneak hunters, a good deal like coyotes, great on finding other hunters' cripples and dead birds. As deer, moose, elk and antelope hunters they are undoubtedly a success, but as goose, duck and crane hunters they are poor. From what I have seen of them their favorite way is to sneak up and take a pot shot or to "ground sweat" their birds. They sneak on to a bunch of birds on or near shore and try to get birds, geese particularly, where these birds water and rest, instead of going back to stubble fields and digging pits where geese are feeding morning and afternoon. The breeds walk the shores very much as the Sunday town boys do with their store clothes on, and shoot out over the open water at birds they cannot reach with BBs.

They are successful in one way at least, and that is in frightening all birds away, particularly geese, changing their feeding grounds, habits, elevation when flying, and hours of coming to and leaving water for stubble. What few birds are left soon scatter and leave that section; those remaining water at small, clear lakes and sloughs, and do not come in to big lakes until it is perfectly dark. The breeds kill one goose or other bird where a so-called city dude who knows his work kills a dozen; and they frighten away 100 where the city man would only drive away a few. Of course, the cities turn out all manner of shooters and sportsmen, but I refer to city men of some experience with the rare gift in man or dog called bird sense.

There is one point of similarity between the Sunday town shooter and the half-breed, and they are both consistent in it, and that is color; they are both great admirers of black as a color. They nearly all wear black hats, coats and trousers, and use powder of the same color. It is too bad that these black clothes people do not concentrate their forces for a purpose for the benefit of the farmer. At times rains are uncertain and much needad in the Dakotas; if these men would line up and fire altogether a number of rounds, as they do in a scattering way on a duck fly-way, the results would be marked. I believe the uncertainty of moisture would be over with; as rain makers they would be a success, and add greatly to the productiveness of the soil of the State.

In Texas and Wyoming the rain makers found that a severe sudden shock would sometimes produce a fog; if these men could be handled scientifically they might produce a shower whenever needed. The shock is then all right, and if they would use less old felt boot and binder twine for wadding it might make sharper reports; but the good old-fashioned thrum-rum hang-fire explosion is what gives them real joy. It is a good deal like the old muzzleloader squirrel shotgun that used to kill 'em dead at twenty rods every shot.

The breeds eat most anything. One day one of us shot a badger and left it on a plowing by the road, next day it was gone and doubtless furnished a meal for several. They will eat a badger poisoned by arsenic. They skin the animal and let it soak in water until all or most of the poison is out, and in a few days are apt to call around again to see if there are any more. This comes from a postmaster direct, who has given them more than one poisoned animal. Skunk is a warm favorite with them; they will eat any animal that gets drowned or stuck in a slough. Their food is limited when winter sets in and consumption kills many. Their clothing is poor and they have no buffalo robes, as in the past.

Last year we had lost several white cranes, that is on our way out we had planned to get some; on our way back we did not take any, and as the law says you must not, we did not. We were glad we did not get any. We had not marked four or five white sandhills with any bands like the carrier pigeons of to-day, nor put any leg seals on such as they put on a $50 China cochin pullet at the New York show. We had no left double upper cut, nor a single right under cut, such as they sometimes try to put on a razor-back shote in the overflow lands of Arkansas or on a sucking calf on the Montana ranges. Our crane were slick-eared crane all right enough. We had seen but very few, probably less than ten all the fall; one day we saw four, two old, two young. As a general rule they go four in a bunch, and it is nearly always an old pair with two young. Although wild, we saw they lit within a mile beyond a hill, and decided to try for one; so going as near to the hill as we dared and lying down, we sent driver and team around to try to get them to fly over us. They rose wild and flew too far to one side, but by straining the guns we managed to down the nearest one, a young bird showing light brown on body, wings, head and neck. About two weeks later, when together in a goose pit, with decoys out on burnt stubble, we heard cranes, and looking out through weeds without rising, we saw four white cranes watching closely before feeding. We could do nothing but wait. After about twenty-five minutes they began calling, showing that they had seen something and were on the lookout. It seems that our driver had seen them light and gave them time to rest, feed and look around before starting toward them to try and get them to fly within range of us. We could tell by their calls they were getting nearer, but we dared not move; at last they rose and we were up and ready for them, and got the four—two old, two young. The leader was winged and ugly, and no one cared to pick him up for several reasons; he could run 100yds. in about eleven seconds, and he could use his bill to advantage to himself. After chasing him on foot and with team we surrounded him and the driver made a lasso out of the reins and got a body hold first throw; the rest was easy. He weighed 20lbs. One young one weighed 17lbs.

There is one curious thing about the so-called snowbird, which winters in North Dakota. It is a small bird, about the size of the English sparrow and not unlike the female sparrow in plumage in summer. In the winter it turns nearly white; whether the feathers fade to white or are shed I cannot say. Natives say they fade to white. I have often noticed that after a cold spell with a flurry of snow I would see quite a few birds partly white, particularly white on wings, where a few days before I had not seen a white bird. This would seem to indicate that perhaps the weather quickly affects the color of their plumage. They go in immense flocks, and when snow is on the ground feed on weed seeds where snow is blown away, also on roads and on weed seeds falling on top of snow. MILWAUKEE.

THE ADIRONDACKS GAME LAW.

GLOVERSVILLE, N. Y.—*Editor Forest and Stream:* In looking over the suggestions from the fish and game protectors as a result of their late meeting in Albany, I notice some of the following recommendations to our State Legislature: First, that deer shall not be hunted with a dog for five years from June 1, 1897; second, the making of a uniform law as regards the open season for partridge, woodcock, squirrels, hares and rabbits.

In view of the fact that, according to the information of men that have given it considerable attention, deer are on the increase in most places in the Adirondacks and its surroundings, and that nine out of ten of the citizens who hunt deer prefer to hunt them with dogs, it would seem unnecessary to deprive a large majority of the sportsmen of the State of the privilege of their particular style of hunting, providing of course the deer are showing a healthy increase.

According to the report of Superintendent of Forests William F. Fox, and published in the FOREST AND STREAM of Jan. 16, 1897, there seems to be a general belief among guides and hunters that a great many deer die from starvation, as the following paragraph, taken from his report, will show: "In the vicinity where the carcasses were found all the foliage of the evergreens and buds of the hardwoods within reach had been devoured, and the deer under the protection of the game law had increased so rapidly within the last few years that there was no longer a sufficient supply of food for them all during the winter season." I have received the same information from some of the most prominent guides and hunters of Piseco, West Canada and Cedar lakes.

Now, as we understand them, the game laws are made, first, to afford ample protection for a healthy increase of game; second, that the greatest good and enjoyment shall accrue to the greatest number. And if Mr. Fox's report is true (which it undoubtedly is), what is the need of a change in the present law to one that will simply increase the suffering and mortality of the noblest game of our State Park.

It is a fact that all game near the Adirondacks is on the increase, unless it be perhaps in some place which is easy of access or near some thickly populated community. For instance, in our own particular county of Fulton deer are often seen where three or four years ago there were none. Any one taking the time and trouble will find that the decrease in some localities is largely influenced by being in the immediate neighborhood of some lumbering camp and when the deer are surreptitiously used to fill the capacious maw of some French-Canadian woodchopper. If hounding is so destructive, why is it that, according to the report of Mr. Fox, they are on the decrease in some localities of St. Lawrence and Lewis counties, where hounding is not allowed, and are increasing in some localities where hounding is allowed?

We mistrust that a great part of this agitation comes from people who never hunt deer, or more probably from the inveterate floater. I wish to say a few words in regard to the favorite style of hunting of some sportsmen, namely floating, or jacking, as some call it.

Assuredly there can be no more destructive and cruel way of hunting deer than for a man to paddle up to a deer while it is in the water and is fascinated with the light in the "jack," and shoot it down or perhaps wound it so that it crawls away into the woods and dies, and perhaps not only entail the death of that one, but of others that are depending on their mother for their sustenance, and consequently wander around and starve through the loss of that sustenance. But this is not the worst of this diabolical mode of hunting, for I have frequently been told while talking with men who prefer floating, that they have shot at as many as four different deer in the same night, and in one case a man told me he had killed three deer during the same floating.

And this, if done when the jacker prefers, which is during his summer vacation, is when venison is in its poorest condition, especially so soon after breeding season, when the does are yet suckling the fawns.

We would gladly recommend an amendment to the law (if it should be proven that the deer are decreasing) which would prevent any one person from killing more than one deer in a season; this would have a tendency to prevent the large parties who go to the woods for a general hunt, and after feeding on venison for from ten days to two weeks prevent them from having the privilege under the law of each bringing out a deer after the hunt is over, as can be done under the present law.

If there is any necessity for a change, why would it not be a good plan, instead of abolishing hounding altogether, to amend the law so that deer could not be killed in water while swimming, as is done to such a large extent at present. But instead must be killed on streams or runways, where they would have a greater chance for escape.

Now, in regard to the recommendation of a change in the existing laws on partridges, woodcock, squirrels, hares and rabbits. Where is there a place throughout the whole Adirondack region where there has not been reported an increase in the number of partridges? And if it is a fact that they are

on the increase, why change a law that is bringing such beneficial results? When have we ever had a better law than the present one on hares and rabbits? The idea of making the season for woodcock and hares the same. What man in the State would care to hunt hares unless they could be tracked on snow, or could be killed in front of the hounds?

It would be a much more sensible thing to stop the killing of woodcock altogether for two or three years, so that they could have a chance to increase in proportion to other game, as it is a well-known fact that they have been decreasing every season for four or five years.

But the best law that could be framed for the protection of game would be one that would forbid the sale of game altogether. This continual pecking away at the game laws where we have good and just ones already is unwise, as it puts everybody in an uncertainty as to what is the open or close season.

Would it not be more to the interest of game protection for those same people who are advocating a continual change in the game laws to use the same amount of effort to have a law and its necessary appropriation which would legalize the appointment of a deputy game protector in each township, so that the laws we now have could be more successfully enforced?

Would it not also be equally as wise for those same game protectors to show a little more zealous effort in enforcing the laws we now have instead of recommending so many radical changes?

I think it is the general opinion of the people who are interested in game protection that the laws we now have (with the exception of the law which allows the sale of game the year around under certain restrictions) are all right, and all that it requires is a more rigid enforcement.

CAYADUTTA.

NOT ALL ALIKE.

Editor Forest and Stream:

Could we analyze the emotions which causes various classes of men to go to the woods and fields for game, we would at once be able to divide these men into three classes, the distinctive features of each being the objective result to be obtained from the trip. Class 1st, the men who strive to obtain a material, tangible result in the shape of the coin of the realm.

Of the second class is the so-called true sportsman, who goes for a lark, a change, to gratify his vanity, and chief of all to bring back birds or game, no matter by whom killed, how killed or when killed, so long as the game is in his hand, and he can exhibit it and brag about it. The seventeen men from Ohio who went up into Minnesota and sneaked out with six deer belong to this class. What blessed things the memories of those seventeen must be stored with!

The third is the single-standard class. They go after game for the sake of the chase. The knowledge of the game's ways and the excitement of the chase are more than the mere result of bringing home a certain number of birds or heads of game. He will have none of the guide except to inform him of the lay of the land, the sign, etc , when in a strange country. But as to letting the guide carry a rifle, it is not to be considered.

Once I met a guide who claimed that he had been engaged by your correspondent, Mr. C. M. Stark, to go into the woods with him, but on putting in his appearance he saw that he was expected to leave his gun behind and instead to carry a big pack of goods, and he very promptly "threw up the job." This same man, by the way, is a curiosity in his way. Born and reared in a large manufacturing town, he had studied cheap hunting literature until he fancied himself a hunter. When I first met him he lived in the woods, eking out an existence by gathering spruce gum; too lazy and ignorant of the ways of the woods to hunt or even fish, he was squalid and filthy to the last degree, but made a brave effort to pose as an ideal woodsman to such greenhorns as chanced to believe his yarns. No doubt C. M. S. saw his true nature and would have none of him. Many of your readers who have been to the Franconia Mountains will recognize him in this description. To do him full justice would require quite a lengthy article, and I don't know but that I will try it some day—he is such a character, and it might serve to point a lesson to those young men who revel in cheap sporting literature.

To return to the sportsman of the second class—enumerated above—one of the greatest sinners against the law of sportsmen's ethics and against the common law are his wife, family and friends. About the first thing they utter after the first greeting on a return from the woods or fields is this: "What did you get?" As if this were the *ne plus ultra* of the sportsman's desires. However, a man in such a position and fearing the foolish nagging of his friends and neighbors, is sure to obtain game in some manner not truly in accordance with sporting ethics, if he cannot get it "straight," and thus we find that the blame can often be placed elsewhere than on the shooter himself. It is not the custom in all countries thus to judge the chase by its material results—quite the contrary in many parts of Europe, and especially among the high Alps of the Tyrol and Switzerland. Nowhere in the world is true sportsmanship so fully developed among the poorer and more ignorant classes as it is among the chamois hunters. Many and many a poor man will work hard for ten months in the year and the other two will chase the elusive chamois, securing perhaps two or three per season, which he invariably sells. He has the chance of killing deer, roebuck, etc., which when sold would fetch more than the chamois—but he never hunts them. It is his passion to hunt the chamois, and he loves it because of the very difficulties and dangers of the pursuit. These men are true sportsmen, whatever their shortcomings and however slender their purse.

How different are some we meet. "What ye got?" is the first question when such an one sees a man with a gun. It is he who killed the deer of Vermont on the crust until there were none left. It is he who skins the covers to the last partridge and the last rabbit, takes the game to the store and swaps it for goods, any kind, wet or dry. Would he eat bird or rabbit when he could get a few pennies' worth of store goods for them and salt pork worth only 8 cents a pound? Not he. He will lie awake nights thinking how to get that last rabbit that's running in the hollow five miles back. Often I have had a day in the woods with one of these critters, but invariably on bagging a bird its market value was considered first, trees and lovely landscapes were estimated as to how many feet of lumber could be extracted from them, and I well remember the smiles and knowing looks which were caused by my occasionally ascending a steep hill to view a particularly pretty sunset or sunrise. Of course a sunrise has no market value, and so there must be something wrong with the man who would ascend a hill to see it—and it not even worth one red cent.

MATTERHORN.

WELLS RIVER, Vt.

Maine Legislation.

BOSTON, March 13.—Mr. Frank Jones, of Portsmouth, who now holds the title of Hon., gave his annual fishing entertainment to fifteen of his friends, at Tunk Pond, Hancock county, Me., last week. The gathering was, as usual, first at Bar Harbor. The company included railroad men and politicians. Annually about the same company assembles, though but little fishing is done. But the hospitality of Mr. Jones is described as most bountiful.

A part of the famous guide license bill has passed both houses of the Maine Legislature, and will doubtless become a law. It has been amended so many times that it is not easy to give it in full text. But I believe that it is shorn of compulsory registration; guides may register, and the commissioners may require them to register. Compulsory badges are cut out of the measure, and compulsory returns to the commission are not required, unless the commissioners see fit to require them; doubtless in special cases. Such is the form of the bill, unless other amendments have been tacked on since reported to me. Other peculiar measures have suffered at the hands of the committee on fisheries and game. They have reported an appropriation of $750 to advertise the fish and game attractions of the State. Leave to withdraw has been granted to the petitioners proposing to regulate the number of pounds of pickerel and perch that might be caught. Legislation inexpedient has been reported on the matter of taxing non-resident sportsmen for game killed. The measure to prevent the trapping of foxes has also died in the hands of the committee; also a proposed measure to prevent the hunting of fur-bearing animals by non-residents. The asking of legislation to authorize the maintaining of private fish ponds has again failed in the committee. The commissioners are justly down on such ponds and the granting of special favors to their owners, especially the taking of fish in close time. The measure to prevent Sunday fishing has been branded "Ought not to pass" by the committee. "Ought to pass" has also been put on the measure for the repeal of a lot of obsolete and private fish and game laws.

But no attempt has been made to repeal the unjust measure that allows of ice-fishing or fishing before May 1 by residents of the State, while non-residents are denied that privilege. This measure works particular injustice at Sebago Lake, where the ice goes out in April, and sportsmen from Portland can fish legally, but Boston fishermen are liable to arrest.

SPECIAL.

From the Eastern Shore.

Editor Forest and Stream:

Brant are still pounding away at Hog Island light tower, the keeper having gathered into his fold over 100 one night last week, while scarcely a night passes that he does not get a fine bunch. The light at Hog Island is of the first order, revolving, thereby sweeping far out to sea, and when turning inland it lights up the bay for miles, the intention possibly being that the light may be seen in the Chesapeake Bay over the mainland, so as to be of service to vessels in that body of water too. However, is it not fair to conclude that this light will eventually drive from our waters not only brant, but our numerous supply of ducks of all sorts?

Brant are now on the flight from Southern waters, and are reported in great abundance and tame. Local gunners are doing better where shooting for market than ever before. Black duck shooting is never worth much after Christmas. We have shot a great deal in years gone by, and while finding the best of shooting during November, and especially in December, have found that after that month the ducks will pay scarcely any attention to decoys.

We met a friend during the week from Chincoteague who reported the very best of shooting there, redheads and brant being very plentiful.

The time is near at hand for the Northern flight of Atlantic coast birds, which will be plentiful through April and May along our coast. These months afford the very best of shooting. We will not undertake to give the names of the birds further than to say all sorts and kinds may be found. Stick a few decoys on the meadow and a few cedar boughs to hide in, and no fear need be felt as to the sport to be had. Many times, from the 50s to the 70s inclusive, have we battered among them until at last we have became tired of shooting, or possibly it was laziness, having to tote the birds for a considerable distance.

A word about fox hunting. It is a fact—so the boys say—that their dogs catch the foxes so quickly that there is no longer any sport in the chase. A few days since they raised a staving old male and picked him up in less than an hour, and this is the case almost each week. Talk about flyers, why, these dogs down here in Viginia fairly singe the grass, they go with such lightning speed.

T. G. ELLIOTT.

KELLER, Va., March 12.

A New Brunswick Moose Head Seized.

ST. JOHN, N. B., March 11.—*Editor Forest and Stream:* I inclose clipping I cut out of the St. John *Telegraph* of to-day's issue:

"During last fall Mr. Charles Church, of New Bedford, Mass., arrived in the city and proceeded to the vicinity of the Washademoak for a couple of weeks' outing. He procured the services of a man who is a hunter and taxidermist as a guide, and started to take in the Canaan River. Game Warden Samuel McDonald asked Mr. Church if he wanted a license, which is worth $20, and was answered in the negative. During the time Mr. Church shot a beautiful moose, and then the trouble began. He left the country for the States, and his guide started in to mount the head. The mounting of the moose head was finished about a month ago, and Chief Game Commissioner L. B. Knight being informed of the matter, ordered its seizure, which was accordingly done by Warden McDonald, and the head arrived in the city on yesterday's Pacific express, and was greatly admired as it was drawn through the train shed on a Dominion Express truck. Mr. Church got out of the country without paying the fine of about $80, and it has not yet been decided on what will be done with the head, which is one of the finest captured in New Brunswick."

You will notice that through trying to escape the license the person referred to has got himself into trouble, and no doubt should he visit New Brunswick again the wardens will be sure to watch for him. I saw the moose head referred to; it is a splendid specimen.

H. H. H.

The Man in the Hollow Tree.

MONTREAL, Can., March 10.—*Editor Forest and Stream:* I inclose clipping from the Montreal *Gazette* of 9th inst., containing our old, old friend of the bear story:

"A correspondent sends an account of an adventure with a bear in the county of Chateauguay. He had started on his return from Howick to Peasoup village with some tea, and, to save time, made a cut across the country and lost his bearings in the swamp. Climbing a pine tree stub to get a better look at the country, he found it hollow, and eventually fell inside. Here he might have remained to die, but that the place was already occupied. He felt something moving and saw the exit darkening. Putting up his hand, he caught hold of the hair of a bear and held on till the top was reached. Here the bear leaped to the ground and then proceeded to crawl into its lair among the roots again, where the correspondent killed it. Then he skinned the animal and also captured two cubs, one of which he gave to a friend on the Scotch Concession, and one to a peddler for 5lbs. of tea."

I think your collection of varieties of this yarn is pretty extensive by this time.

F. W. G. J.

[In a former issue was given the collection to which our correspondent refers. The story of the man in the hollow tree, whence he was liberated by a bear, was told in the Middle Ages, when bear stories were written in Latin, and it has been repeated at frequent intervals ever since in all lands the world over haunted by bears. It will outlast the wilderness on this continent; it may live long after the last "stump bear."]

Game in Central Iowa.

Editor Forest and Stream:

I have just read something that brought to mind some observations I made between July, 1879, and September, 1880, in central Iowa. In the fall of '79 I saw ducks and brant so plentiful among the cornfields bordering the Des Moines River, in Boon county, that the most insatiable might have tired of the slaughter. They drifted like clouds, and their quacking was incessant. I did no shooting, but frequently sat in the buggy and watched the flight. I was much amused one day at the antics of some sandhill cranes. There were about a dozen of them on a bared spot near a small lake, and they were having a game something like the leap frog of our boyhood days. I drove past them not over 200yds. distant, but they went on with the dance, apparently undisturbed by my inquisitiveness. Prairie chickens were much in evidence also. A farmer living between Ogden and the river told me that in midwinter they came to his barnyard and hayricks, and he could almost walk on them before they took wing.

Will some reader of FOREST AND STREAM tell us how it is there now.

G. W. CUNNINGHAM.

Probably a Red-Throated Diver.

NORFOLK, Neb.—Fast fall while hunting ducks on Lake Quinnebaugh, Nebraska, my friend, Mr. Geo. A. Smith, who accompanied me, shot a bird that puzzled us to classify. In size it was a little smaller and with head and bill shaped exactly like the common loon, but the colors and markings were entirely different, the back and wings being of a slate color and the breast white; in flight it resembled the speckled front brant somewhat, and for which bird Mr. Smith mistook it when he fired. Only one person at the lake at the time claimed ever to have seen the bird before, and he called it a gray loon. I am sorry now that the bird was not saved for identification, but unfortunately it was mutilated by some animals and so thrown away.

Ducks and geese were both wild and scarce last season; though lacking in numbers, they made up for it in variety, as we killed ten different kinds of ducks in the first fourteen shot.

H.

[The bird probably was the young of the red throated diver (*Urinator lumme*)]

Rhode Island Game Wardens.

PROVIDENCE, R. I., March 15.—A meeting of the Rhode Island Fish and Game Association was held last Wednesday to take measures to notify the city and town clerks of the law providing for the appointment of the game wardens in April. After some discussion it was voted that the secretary notify all city and town clerks of the law and ask them to take action on it. Last year thirty-six were notified and twenty-two replied. It was announced that the revised game laws that are being drafted would be presented to the General Assembly at its next session.

Bluebirds and robins have been reported as individuals in various parts of the State during the past few days, also several flocks of blackbirds.

Flatfish have commenced to bite, the first catch being reported at Bullock's Point steamboat landing on Thursday, when Hezekiah Bunn, of Riverside, caught several, one weighing 2lbs. 4oz.

W. H. M.

Ducks in Massachusetts.

Gov. WOLCOTT has vetoed a bill exempting coots and other fowl, and has given his reasons as follows:

"The purpose of the first is to exempt from all legal protection at any season of the year certain of the so-called duck species, therein described as white-wing scoters, commonly called coot, sheldrake, old squaws and loons, it being illegal under existing law to kill these birds between the dates of April 15 and Sept. 1. These birds have little or no marketable value, and their presence in our waters affords pleasure and interest to many, and the right to destroy them during the entire year instead of during seven and one-half months, as now permitted, would, in my opinion, materially increase the enjoyment of few and the profit of none."

By this action the Governor has placed sportsmen under renewed obligations for his sensible exercise of the power of veto as applied to game legislation.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

QUEBEC GAME AND FISH TERRITORIES.

DEPARTMENT OF LANDS, FORESTS AND FISHERIES, Quebec, March 11.—*Editor Forest and Stream:* Several of your fellow-countrymen who are no doubt desirous of acquiring exclusive hunting and fishing rights in this Province over certain sections which our laws allow the Government to lease out, after having previously erected them into hunting and fishing territories, frequently write me for information.

I hope you will allow me to make use of your paper to answer their questions, as it is read throughout the United States by all sportsmen, and by publishing my answers you will convey information not only to those who write directly to us, but also to all to whom the same may be of interest.

I will be as brief, as concise and as clear as possible, answering each question put to me.

1. To whom must applications for leasing a hunting territory, a salmon river or any lake be sent?

Always to the Commissioner of Lands, Forests and Fisheries, at Quebec.

2. On what conditions can leases be effected?

The conditions vary according to the extent of territory, its proximity to means of communication, and the intrinsic value of the territory whose lease is applied for.

3. In what parts of the Province are the best lakes for fishing and the best salmon rivers?

The best salmon rivers are those of the Gaspé Peninsula and Labrador, which flow into the St. Lawrence on the north and south. There are also some which flow into the Saguenay. All these rivers are well known to American fishermen.

The best lakes for fishing are those in Labrador, in the Lake St. John district; in the counties of Ottawa and Pontiac, in the district of Temiscouata, and in the region north of Montreal. They contain an abundance of speckled trout (*Salmo fontinalis*), gray trout (*Salmo confinis*), touladi, bass, etc.

4. In what parts of the Province of Quebec are the best hunting territories situated?

In Labrador, the counties of Ottawa and Pontiac, the Temiscouata region, the county of Charlevoix, the Gaspé Peninsula and the Matapedia Valley, where there are numbers of moose, caribou, red deer and smaller game. Moose and red deer are found in abundance, especially in the counties of Pontiac, Ottawa, Montcalm, Terrebonne, Temiscouata and generally throughout the region comprised between Lake Temiscamingue to the west and the Saguenay and Lake St. John to the east. There are a good many also in the Gaspé Peninsula and the Shick-Shock Mountains.

Caribou, both woodland and barren ground, exist in large numbers, the former in rear of Quebec, about Lake St. John, in Temiscouata, and in Saguenay as far as Newfoundland, Labrador; the latter in the upper regions of Canadian Labrador, adjoining the vast plains of Hudson's Bay.

Woodland caribou are especially abundant in the counties of Saguenay, Charlevoix, Montmorency and Chicoutimi on the north, and in Gaspesia and the Shick-Shocks and Temiscouata on the south shore of the St. Lawrence.

Canadian Labrador—that is to say, that portion comprised between the Saguenay on the west and the 57th meridian on the east—contains the most valuable fur-bearing animals, from the shore of the Gulf of St. Lawrence on the south to the parallel of 52° 10' on the west and near 56° on the east. In this region are found the marten, pekan, beaver, gray wolf, black bear, mink, wolverine, lynx, black fox, silver fox, cross fox, otter, etc.

5. Can the lessee of a hunting or fishing territory invite his friends to come and hunt or fish with him without their being compelled to take out a permit or pay for a license?

Undoubtedly. For all hunting and fishing purposes during the open season the lessee is master of his own territory, and may invite whomsoever he pleases to share his pleasure and amusements without his guests having to pay for licenses, whether they do or do not reside in the Province.

6. What rights are conferred by the lease?

The lease gives the lessee the exclusive right to fish and hunt in the territory leased to him during the open season.

7. What extent of territory can be leased for hunting purposes?

A hunting section cannot be greater than 400 square miles, but there is nothing to prevent any individual, company or club from leasing several sections. Sections of 10, 20, 30, 40, 50, 100, 200 or 300 square miles can also be leased.

8. What is the cost per square mile of hunting territories?

Everything depends on the location of the land selected, but it cannot be less than $1 per square mile. If the territory contains a considerable number of large game, such as moose, caribou and red deer, and if it is easy of access, as much as $10 per square mile may be charged. The territories most easy of access are those along the Canadian Pacific, the Temiscouata, the Pontiac, the Gatineau Valley, the Intercolonial, the Grand Trunk and the Lake St. John railways.

By the Canadian Pacific one can reach the region north of Montreal and the upper Ottawa. The Pontiac and the Gatineau Valley railways run through territories containing considerable numbers of large game. The Temiscouata takes the hunter into the center of a region where caribou and red deer abound. The Intercolonial gives easy access to the Matapedia Valley. The Grand Trunk takes one through the Eastern Townships, where there are also great numbers of large game. The Lake St. John Railway runs through the district of that name, which is already so advantageously known to the public. The Jardins, in the county of Charlevoix, are reached by the steamers of the Richelieu & Ontario Navigation Co. and by the colonization roads opened by the Government. Labrador is reached by steamers running weekly between Quebec and the north shore of the St. Lawrence.

Of course, in a letter like this I am compelled to restrict myself to general information, but I will always be at the disposal of those who may wish for more details. Moreover, I will in a future letter revert to this special and very important subject.

9. For how long are the leases?

They cannot be for less than two nor for more than ten years.

10. When, where and to whom are the rents paid?

The rent is paid on signing the lease and every year afterward at the same date, at Quebec, to the Commissioner of Lands, Forests and Fisheries.

11. Can the lease be transferred?

The lessee may sublet, sell his rights or transfer his lease; but such transfer or sale is subject to the approval of the Government.

12. Have the lessees the privilege of cutting timber needed for building their houses, for fuel, etc., on lands belonging to the Crown?

Yes.

13. Have lessees the right to take to the United States the game killed or fish caught by them?

Beyond a doubt, provided the hunting and fishing have been within the open season.

But, Mr. Editor, this letter is already long enough. Next week I will answer other important questions bearing on the subject.

L. Z. JONCAS,
Superintendent-General of Game and Fisheries.

PENNSYLVANIA GAME AND FISH WARDEN.

THE PENNSYLVANIA FISH PROTECTIVE ASSOCIATION, PHILADELPHIA.—*Editor Forest and Stream:* We are working for the defeat of a bill entitled "An Act to appoint a Game and Fish Warden, and to prescribe his power and duties," now before the Legislature. If enacted one warden will be appointed to the office by the Governor, who reports to the Governor, Auditor-General and State Treasurer, and is not responsible in any manner to the Game and Fish Commissioners. He appoints all deputy wardens and apparently handles all moneys relating to his work, without the power of veto by the Commission. The powers delegated to him are dangerous and may prove inimical to the fish and game interests. The Fish Commission has accomplished too much good work for any friend of fishculture or protection to assist in striking a blow which will certainly impair or destroy their future usefulness. M. G. SELLERS, Sec'y.

In comment upon the above communication, Mr. James H. Worden, ex-president of the State Sportsmen's Association, writes as follows:

Editor Forest and Stream:

This article in many instances is misleading; in order to justify the action of the supporters of this measure, and that every citizen of this State may have an opportunity to judge of the merits of this act, I mail you herewith a copy of the bill. Will you kindly publish the bill, that every citizen having an interest in the protection of both fish and game in this State may have the opportunity of examining its provisions, enabling him to intelligently address the member and senator of his district for or against the passage of this act.

As one of the supporters of this act, I hope the widest publication of the two communications will be given the weekly and daily press of this State, that the sentiments and wishes of the people of this State may be voiced on this subject.

During the past ten years the Board of Fish Commissioners of this State have had appropriated to them $204,000, $42,000 of which was specifically appropriated to them for water bailiffs; and I believe it would be interesting to many citizens of Pennsylvania if the writer of the article referred to would have kindly made some authentic statement of the number of arrests and convictions secured, the number of cases of violations, etc., investigated, and the amount of fines imposed and collected as the result of this expenditure, rather than to have made the sweeping assertion "that the Fish Commission had accomplished too much good work for any friend of fishculture or protection to assist in striking a blow which will certainly impair or destroy their future usefulness."

There is no one who has a higher personal regard of the ability, integrity, honesty of purpose and usefulness as citizens of this Commonwealth than the writer of the gentlemen composing the Board of Fish Commissioners. But I do claim that their system of protection is antiquated, selfish, inoperative and expensive, which I propose to prove by this article.

Notwithstanding the fact that a large majority of the citizens of this State interested in both the protection of game and fish are dissatisfied with the present system, they insist on continuing it upon a more elaborate and expensive method by asking the State to empower them to appoint a water bailiff in each of the sixty-seven counties, at a fixed salary of $10 each per month and reasonable expenses.

Computing this at the lowest possible fixed basis, it will create an annual expense of not less than $17,000, or three and a half times greater than at present, and this for the protection of fish alone.

The game and fish warden act, now known as the Baldwin act for the protection of fish and game, which, as your readers will see, limits the annual expense to the State to $6,000 and furnishes 212 fish and game protectors. A secretary for both the Game and Fish Commissioners, whose duty it is under the direction of these two commissions to render their annual reports to the Governor in detail, establishes an office in the State to which every citizen can appeal for any information desired relating to game and fish, and to which they can report any violations of the game and fish laws, which, under the provisions of this act, must be promptly investigated. All the appointments of the warden are made subject to the approval of the Board of Fish and Game Commissioners in joint session met; he handles no money except that which is paid to him and his deputies upon warrants, which must be verified under oath. His plenary powers are just to all law-abiding citizens; the person who willfully violates the game and fish laws of any State is an outlaw, and the powers conferred to meet such violations must be strong enough to place the warden on a physical par with the violator. To attempt to combat this upon the feeble score that he might not use the powers delegated to him with discretion at times is as absurd as it would be to oppose the appointment or election of certain other necessary officials. There is little doubt that on the passage of this act the Governor would soon have a list of eligible, capable men from which to choose.

An act similar to this has been in successful operation in Michigan for the past ten years, and I quote a brief synopsis of the workings of this act, taken from the fifth biennial report of the State game and fish warden of the State of Michigan, in which he reports for the years 1895 and 1896 as follows: Violations investigated, 1,738; arrests made, 1,007; convictions secured, 814; amount of fines and costs, $12,831.33; seized $100,000 worth of illegal nets—all of which was accomplished at a cost to the State of Michigan for the years 1895 and 1896 of $10,506.90. And to offset this the State's receipts arising from prosecutions, etc., were $12,831.33, or $2,324.42 more received by the State than the cost of conducting the operations of this system.

Kindly compare this system with the one now being operated by the Pennsylvania Fish Commission. Draw your own conclusions from an impartial standpoint as to which you consider the best system.

Believing there are none who recognize more keenly and considerately the very creditable work that has been accomplished in the past by the Fish Commissioners in propagating and distributing certain game fish and food fish than does the writer and the many supporters of the Baldwin act, we do claim, and that without fear of successful contradiction, that the Baldwin act does provide a better system of protection than the one now being operated to the detriment of this valuable Commission and the people of this State.

There is no system of successful protection, that has ever been operative, that did not require the personal attention of some one to direct the work of the department. Quoting from the State warden of Michigan, he says: "Whatever success the warden has had is due to the fact that he has devoted his personal attention to the work, conducting prosecutions both in justices' and circuit courts, where local prejudices or other causes made it seem desirable to appear in person, and endeavoring not to shirk his share of the disagreeable work of tramping through the woods for violators, or spending nights upon lakes and streams to catch netters and spearers. A chief who takes no personal interest in his work will not inspire the proper zeal in his subordinates, and, in my opinion, the law should compel the warden to give his whole time to the office, having no other business." This the Baldwin act does.

It is beyond the province of the acts creating the boards of game and fish commissioners, serving as they do without compensation, to either expect or compel them to give their personal attention to the proper patrolling and prosecution of this work.

The purport and intention of the Baldwin act is not to destroy the usefulness of these two commissions, or in any manner to interfere with their good work, and it is unfair and unjust to assume that the Governor of this Commonwealth would appoint a person who would be antagonistic to the workings of these two commissions; but, on the contrary, is it not fair to presume that he would zealously guard against the selection of such a person, and aim to appoint one whose every effort would be to assist them in every particular.

By an act of this nature we unite every organization, association, club, corporation and individual interested in the protection of our game and fish. In doing this we also create a more advanced, less expensive and more successful system of protection, and will also harmonize and cultivate a uniform interest in which all will aid in furthering the work of these departments. It is with the purest motives and the most honest convictions that we submit this communication for the consideration of the public and the friends of better protection. JAMES H. WORDEN.

The Game-Warden Bill.

An act to provide for the appointment of a game and fish warden, and to prescribe his powers and duties.

SECTION 1. Be it enacted, etc., that from and after the passage of this act, it shall be the duty of the Governor to appoint some person, a resident of this State, game and fish warden. Said warden shall hold office for four years, or until his successor has been appointed and qualified, unless removed for cause by the Governor; he shall receive a salary of $1,800 per annum, payable monthly, and shall also be reimbursed his actual expenses necessarily incurred by him while engaged in the performance of his duties, to be paid on the warrant of the Auditor-General, monthly, on the approval of his vouchers therefor.

SEC. 2. It shall be the duty of said game and fish warden to devote all his time to the position to which he is appointed, and he shall not be engaged in any other business or vocation while filling this position. He shall be secretary of the boards of game and fish commissioners, and he shall occupy as his permanent headquarters the room assigned the game commissioners at the Capitol in Harrisburg; it shall further be his duty to collect, classify and preserve all such statistics, data and information as in the judgment of either board will tend to promote the objects of their department. He shall take charge of and keep all reports, books, papers and documents which shall in the discharge of their or his duties hereunder come into their or his possession, or under their or his control. He shall make the annual reports to the Governor as required under the direction of the game and fish commissioners.

SEC. 3. It shall be the duty of said game and fish warden to seize all nets of illegal mesh found in use in the waters of this State, and all nets and other fishing apparatus or appliances found in use in violation of the laws of this State; and to enforce the statutes of this State for the preservation of all insectivorous and game birds and game mammals; and to enforce all other laws of this State for the protection and propagation of birds, game and fish, now in force or hereafter enacted; and to bring or cause to be brought, and to prosecu e or cause to be prosecuted, actions and proceedings in the name of this Commonwealth to punish any parties for the violation of said statutes and laws. Such actions and proceedings may be brought in the name of the Commonwealth in the like cases, in the same courts and under the same circumstances as they may now or any time hereafter be brought by any individual or by the presecuting attorneys of the several counties, under and by virtue of any laws now existing or hereafter enacted.

SEC. 4. Said warden may make complaint and cause proceedings to be commenced against any person for the violation of any laws for the protection or propagation of game or fish without the sanction of the prosecuting attorney of the county in which such proceedings are commenced, and in such case he shall not be obliged to furnish security for costs. Said warden may also appear for the Commonwealth in any court of competent jurisdiction in any case for violation of any of the laws for the protection or propagation of fish or game, and prosecute the same in the same manner and with the same authority as the prosecuting attorney of the county in which such proceedings are commenced.

Said warden shall have power to search any person, and examine any boat, conveyance, vehicle, fish box, fish basket, game bag or game coat, or any other receptacle for game or fish, when he has good reason to believe that he will thereby secure evidence of the violation of the law; and any interference or hindrance, or attempt at interference or hindrance, with such search or examination shall be *prima facie* evidence of a violation of the law by the party or parties who hinder or interfere with, or attempt to hinder or interfere with, such search and examination.

Said game and fish warden shall at any and all times seize and take possession of any and all birds, animals or fish which have been caught, taken or killed at a time, or in a manner, or for a purpose, or had in possession or under control, or have been shipped contrary to any of the laws of this State; such seizure may be made without a warrant.

Any court having the jurisdiction of the offense, upon receiving proof of probable cause for believing in the concealment of any bird, animal or fish caught, taken, killed, had in possession, under control, or shipped contrary to any of the laws of this State, shall issue a search warrant and cause a search to be made in any place; and to that end may cause any building, inclosure or car to be entered, and any apartment, chest, box, locker, crate, basket or package to be broken open, and the contents thereof examined by said game and fish warden.

All birds, animals or fish, or nets or fishing appliances or apparatus, seized by the game and fish warden shall be disposed of in such a manner as may be directed by the court before whom the offense is tried, or by any court of competent jurisdiction.

Said game and fish warden shall not be liable for damages on account of any search, examination or seizure, or the destruction of any

nets or fishing apparatus of any kind, in accordance with the provisions of this act.

SEC. 5 Said game and fish warden shall have the same power to serve criminal process as sheriffs, and shall have the same rights as sheriffs, to require aid in executing process. Said warden may arrest, without warrant, any person or persons caught by him in the act of violating any of the aforesaid laws for the protection or propagation of birds, game or fish, and take such person or persons forthwith before a justice of the peace, or any other magistrate having jurisdiction, who shall proceed without delay to hear, try and determine the matter; and the same proceedings shall be had as near as may be, as in other criminal matters, triable before a justice of the peace, or any other magistrate having jurisdiction. Such arrests may be made on Sunday, in which case the person or persons arrested shall be taken before a justice of the peace or any other magistrate having jurisdiction, and proceeded against as soon as may be on a week day following the arrest.

SEC. 6. Said warden shall, in the month of December in each year, file in the office of the Auditor-General an account in writing, stating the days and parts of days spent in the discharge of his duties, the kind of service rendered, and the places where rendered, and the expenses paid and incurred in the time of the discharge of such duties, that said amount as claimed had actually been expended and he had in no wise received return therefor, which account shall be verified by the oath of said warden stating that the same is correct and true in every particular.

SEC. 7. Said warden shall, at the close of each calendar month, file with the secretary of the Commonwealth a report in writing and in detail stating the service performed by him during the last preceding month, including an account of the suits commenced at his instance, as herein provided for, the disposition made of the same, the result of any brought to trial; the amount of fines collected from each case, and the condition of any undisposed of, and any other particulars he may think proper; and no payment for services performed or expenses paid by said warden shall be made until he shall present to the Auditor General, in addition to the usual oath of performance and payment, a certificate from the said secretary of the Commonwealth that he has made the report required by this act. The secretary of the Commonwealth shall cause the monthly reports of said warden, or so much thereof as may be of interest to the public, to be transmitted annually to the Legislature when in session.

SEC. 8. Said game and fish warden shall have the power to appoint deputy game and fish wardens, by and with the consent of the boards of Game and Fish Commissioners, in joint session met, who shall have the same power and authority herein provided for the game and fish warden himself, subject to the supervision and control of and to removal by the game and fish warden. Said deputy game and fish wardens shall receive $3 per day for each day actually spent in the discharge of their duties, under the direction of game and fish warden, and their actual expenses necessarily incurred when so employed; said $3 per day and expenses to be paid monthly on the warrant of the Auditor-General, on the approval of itemized vouchers thereof, verified under oath and certified by the game and fish warden; but the number of deputy wardens shall not exceed ten, and the total amount certified by the game and fish warden, and approved by the Auditor-General, for compensation and expenses of deputy wardens in any one year, shall not exceed the sum of $3,000. Said game and fish warden shall also have the power to appoint in each county not to exceed three residents thereof as county game and fish wardens, who shall have the same powers in their respective counties as herein provided for the game and fish warden himself, subject to the supervision and control of and to removal by the game and fish warden. The said county game and fish wardens may be employed by individuals, clubs, corporations interested in the enforcement of game and fish laws, and shall receive such other compensation as may be allowed and approved for by the county commissioners of their respective counties.

Any person who hinders, obstructs or interferes with, or attempts to hinder, obstruct or interfere with the said game and fish warden, or any deputy or county warden in the discharge of any of his duties, shall be deemed guilty of a misdemeanor, and on conviction thereof shall be fined not less than $10 nor more than $50, shall be confined in the county jail until said fine and costs are paid, provided that said imprisonment shall not exceed thirty days.

THE CEDAR RIVER, IOWA.

THOUGH nearly one-half a century has elapsed since the settlement of that portion of Iowa (especially Mitchell, Floyd and Chickasaw counties) through which the Cedar River flows, it still retains much of its picturesque scenery and ideal camping grounds.

Boating, bathing and fishing are still pleasurable pastimes, and the adjoining prairies hold forth inducements to the sportsman in the way of jack rabbits and prairie chickens; while the wooded sections are frequented by the quail, pheasant, cotton-tail, gray and fox squirrels. Ducks and geese, in their migrations both spring and fall, furnish good shooting, often lasting several days during their flights.

Charles City and all of the towns and villages along this stream from its source (sixty miles north) and as far south as Waterloo (fifty miles south) have their flouring mills and various water-power companies All the dams that cross the Cedar this whole stretch of 120 miles have no runways for fish; thus their natural habit of running up in time of June and spring freshets and dropping back during the summer and autumn months is balked. Although there is a law that requires all corporations to place fishways in their respective dams, up to the present time it has not been enforced.

Native game fish, pike, pickerel, bass (black and rock), are yet quite plentiful considering these impassable barriers and the wholesale slaughter with spear, which was lawful up to four years ago.

The State Fish Commissioner caused to be placed above the dam some five years ago a few hundred Oswego bass and crappies and their growth and yearly increase are quite noticeable. Specimens of the bass have been caught weighing 4lbs. One year ago 25,000 wall-eyed pike eight days old were placed below the dam.

Splendid strings of pike and bass were taken from these waters last season. Pike are more numerous below the dam. Twenty-nine that weighed 65lbs. were caught the first week in October. During the freshet in June the largest wall eyed pike known to this region was caught with bare hands by a Mr. Jennings; weight, 16½lbs.

Notable among the fish taken in 1896 were eleven pike weighing 62lbs., and two black bass, one of 6¼ and the other 6½lbs. The two big bass were taken one day apart, and in the same place, eighty rods above the dam, in 9 or 10ft of water. The 6½lb. bass took the second prize of $15 offered by the Black Hawk County Fish Club for the next largest bass caught in the State for '95, whether a member of their club or not.

The very best fishing for black bass in this region is at Floyd, six miles above Charles City. There is good water for three miles above the Floyd Dam, and it is here that parties camp for weeks during the summer. Great ledges of limestone, 40 to 60ft. high, alternate along its shores. In many places these walls are so abrupt and free from soil that nothing but the gnarled, scrubby red cedar can find root here. Most of the fish taken are caught with rod and line. The silk phantom and the gang-hook spoon are used, while soft crabs are in demand for bass fishing in July and August. The chub and shiner constitute the principal bait for the majority for all kinds of fish.

The best catch of the season was made by Dr. Sitzer, with a casting rod, using a small patent frog. His remarkable catch has already been published in FOREST AND STREAM (Oct. 17), namely: six black bass, weight 18½lbs., in forty-five minutes. These bass were caught by wading and casting 100ft. below.

Over 2,000 bass were taken last season at Floyd, aside from a goodly number of pike.

An active game and fish club, with a salaried warden, will, we hope, do away with unlawful hunting and fishing as practiced in this section in the past. VANE SIMMONDS.

ANGLING NOTES.

Signs of Spring.

"ABOUT these days," as Josh Billings used to say in his almanac, the angler begins to watch for signs to determine whether the spring is to open early or late. For months in this region his eyes have been directed chiefly downward to see where he placed his feet that he did not get a fall on the icy sidewalks; but now he is looking aloft to see if by chance the bright sun, high in the heavens, has induced a robin to wing his way north and perch with the sparrows in the leafless trees, while it looks over the situation, and the snow, to decide whether it is rushing the season or not. All the long winter the angler has taken things as they have come—snow, sleet, rain, frost, have meant nothing to him, except that he must put on extra clothing, or a mackintosh, or carry an umbrella; but now it is different, for he watches the snow banks to see how rapidiy they diminish, and he looks at the thermometer with interest, and turns the paper to "Old Probabilities" to see what is going to happen as to weather in the near future, and when the street gutters are running full of water he thinks of how the trout brooks are breaking up and running bankful with rain water and melting snow.

We know what Tennyson said about a young man's fancy in the spring and the fuller crimson on the lapwing's breast, but he seemed to know nothing about the fever in the blood of a man who is not young which indicates the approach of spring as surely as the livelier iris on the burnished dove. That glorious fever which no one dreads and for which there is but one cure. The symptoms are always the same, and every one can diagnosticate his own case and save a physician's fee. A mild symptom is when the angler looks into the tackle shop windows, but this is not an infallible sign of the spring fever, for he is quite liable to look in at any time of the year; but if this is followed by an overhauling of fly-books one may look next to see him going over his rods and other tackle, and if he gets out his fishing clothes and shoes the fever is near its height. He will turn to the fishing department of FOREST AND STREAM to see what its correspondents may have to offer as to probable indications regarding the opening of the waters in different sections, and he will peruse the advertisements of tackle dealers to see what they have to offer that is new. Then he will send in an order for some flies and leaders, perhaps a new rod or reel, and when they are received he will be in what may be considered a critical condition, and the spring fever is consuming him, and he must go a fishing or lose a lung, as that is the only remedy known to the *materia medica* which will abate this peculiar and ever recurring fever. What a delicious remedy it is, and what large doses of it one can take without the slightest protest, and how efficacious it is to cure other ills than the spring fever, for the list is larger than the list of ills that the patented cure-alls are so familiar with When I saw the sparrows watering on Washington's Birthday I pitied the poor things for not having a better knowledge of this northern climate, but yesterday two grasshoppers were found kicking their heels in the sun on the south side of a barn, and before I write another line I must look at an old pair of fishing shoes that gave out in Canada last fall and which I have not thought about since.

Florida Fishing.

With the approach of the season when fishing will open in the North the Northern angler who cannot avail himself of winter fishing in the South takes less interest in the fishing in Florida waters; but two of the Fisheries, Game and Forest Commissioners of New York, Messrs. Charles H. Babcock and Hendrick S. Holden, have been taking a short vacation in the South, and have distinguished themselves by excelling previous records in kingfishing. Mr. Holden's father, Mr. E. F. Holden, and Wm. J. Gillette, of Syracuse, constituted the remaining members of the record-breaking fishing party. The largest fish weighed 20lbs., and was caught by Mr. E. F. Holden, but the average weight of the catch was 10lbs. Commissioners Babcock and Holden are accomplished fly-fishermen, with decided preferences for the trout of the Adirondacks and Canada and the ouananiche of Lake St. John and the Saguenay, but Mr. Babcock tells me the kingfish on a reel makes one's blood tingle, and the sport is fast and furious when a big school is found. Both gentlemen are very enthusiastic about their Florida fishing, and say they never saw such a sight as on the day that they caught the big kingfish at Miami. Fish would jump 10 or 15ft. out of the water, and when one fish was hooked the rest of the school seemed to follow it until it was landed or it was cut into bits by a shark.

Never do I hear of kingfish fishing but I think how, inadvertently, the late Prof. Goode made me steal some other man's thunder by ascribing to me in his book, "American Fishes," what some other man had written. The trouble is I do not know who this other man may be, nor did Prof. Goode when I called his attention to the error. He says: "Its great gameness (the kingfish), its beauty of color and form, and its excellent flavor, Mr. Cheney assures us, caused the loyal citizens of New York in colonial days to call the species the 'kingfish,' and in former times, when it was abundant in New York Bay, the kingfish and the small striped bass were the crowning glory of the old-time fishing."

I regret that I never wrote anything of the kind, nor did I write what is credited to me in the same chapter later on about tackle and the manner of fishing for kingfish. I have always expected that some one would accuse me of pilfering his "instructions," for I had a copy of the book in my possession for some time before I discovered the error and informed Prof. Goode of it. He intended to make a correction if the book ever reached a second edition, but now it will never be corrected by the author.

Mr. Rowland Ward, of London, probably the most eminent man in his profession as a taxidermist, writes me that he will sail the middle of March for this country with his wife to try the tarpon fishing in Florida. Mr. Ward had heard of tarpon fishing in this country and had seen a mounted specimen, but did not quite know how to set about getting to the tarpon grounds, so he wrote to FOREST AND STREAM and got in return full sailing directions, and it is to be hoped that he will be successful in killing some tarpon when he arrives, as did another Englishman who came over and outfitted himself with tarpon tackle in this country at the suggestion of this journal.

Fish Laws.

Every winter there is an increasing number of amendments to the game law of New York, good, bad and worse. It is a big State, and it is a difficult matter to reconcile all interests, aside from the selfish interests.

One bill that I noticed this winter had in it a clause that permitted spearing in one of the interior lakes when the fish in the lake were on their spawning beds, and I was told that the bill was introduced at the instigation of a fish and game club, as they claimed that the fish—whitefish—could be taken by no other means. This bill got a great start toward final passage, when it ran against a snag of some sort It was whispered in Albany that Gov. Black had a fine new pen and penholder, with a supply of ink, on purpose to veto the bill when it came to him for approval. However this may be, the spearing clause was stricken out of the bill without any opposition that I could hear of. I have the best possible authority for saying that Gov. Black is as much interested in the fishery interests of the State as he is in its forestry interests, and I believe that no bad fish and game legislation will meet with his approval, however well it may be concealed in verbiage.

A bill has just been introduced by Assemblyman Eldridge, of Warren, which forbids trolling or fishing in Lake George from a steam or naphtha launch. This measure was recommended by the Fisheries Commissioners because there was almost a universal demand for such action by the residents of the region around Lake George. The claim has been made that some few owners of steam yachts catch more trout and bass, fishing to make big records for publication, or to have the fish photographed, than the occupants of a dozen rowboats, and that such fish, caught ostensibly for sport, are turned over to the guides, to be sold for their own benefit; and that in this way over a ton of trout found their way to market in one season from one steam yacht. Naturally the rowboat fishermen conclude that they are outclassed, for they cannot skim the lake with rowboats as can the owners of steam craft. In the fall the steamboat owners can fish pretty much all the desirable shoals in the lake in one day, while it would be difficult for one rowboat to cover one hundredth part of the water in the same time.

A. N. CHENEY.

Salmon Reported Taken Through the Ice.

HADDAM, Conn.—*Editor Forest and Stream:* During the last of February I felt that some fresh fish fried brown in pork fat would taste very good; and as a couple of young friends of mine had informed me that they had some fine bait fish, I told them I would furnish transportation to Cedar Pond if they would do the work; and this arrangement being satisfactory, we went fishing through the ice. I do not think it is right to catch any kind of fish in this State in the winter except eels, and would be glad if it were prevented by law, but you know the lines, "We know the right and oft approve it too," etc. This was my case exactly; so we went fishing. We caught thirteen pickerel and four yellow perch—no large ones, but all of fair size, and when cooked as aforesaid they were good; in fact, they were very good.

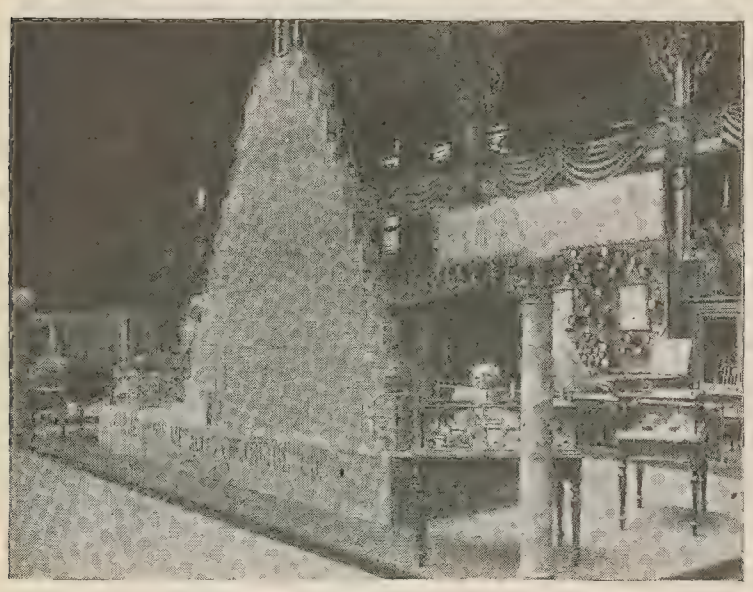
Now, if this were all there was to the trip, I should not trouble you with it, but we had a very enjoyable day—saw numerous rabbit tracks in the snow, and several places where three or four partridges had crossed the road; and got sight of one cock partridge that looked as large as a small turkey, as he stood broadside to us, with head up and outstretched neck, with the snow for a background. These things were pleasant to see and assured us that when the autumn comes again the alders, the white birches and the sumacs will not be tenantless. May we be there to see.

At noon we went to a farmhouse near the pond, and the good old lady gave us a table on which we spread our lunch, and she kindly added a pitcher of excellent cider with which to moisten it. And now comes the part which induced me to trouble you: One of my young friends who is a hunter and a fisherman told me how last December, while fishing with "tip ups" through the ice on Salmon River, he saw a "flag" go up, and on taking hold of the line he felt that he had a very large fish, and pulling carefully he raised a salmon about half its length out of the water when it dropped off, as it was not hooked at all, but had held to the bait fish to be raised thus far. He said he thought it would have weighed as much as 8lbs. I had supposed that salmon left the freshwater streams before winter set in, and did not know that they would take a minnow bait, though I must confess I am not up on salmon. Perhaps Mr. Cheney will tell us all about it. By the way, did not the Carman River trout that I tried to tell FOREST AND STREAM about several years ago deserve a place among your big fish? Was the fish too big or the story too thinly authenticated? As I remember the story the trout weighed 13lbs., and I believed it then; and I think I gave names of people then living at Brook Haven who could confirm the account. A.

[We do not recall the statements regarding the reported 13lb. fish, but it is safe to assume that it was not a brook trout. Can our correspondent give more specific information?]

The Striped Bass Record.

SOUTH PORTSMOUTH, R. I.—*Editor Forest and Stream:* Noting in a recent issue the weight of a striped bass for which was claimed, as far as known, the record weight of large fish of that species, I would state that on July 11, 1882, a striped bass was taken chum fishing on Sachuest Neck, R. I., with rod and reel by Wm. M. Hughes, of South Portsmouth, R. I. It was weighed at the market of Wm. Lawton, of Newport, in the presence of Chas. Lawton, Albert Gash and Daniel R. Connell, and was found to weigh, after cleaning, 67lbs. There is no doubt that this fish would have weighed over 75lbs. undressed. This fish has always been known as the record fish for Newport, and, so far as known, is the largest fish taken in this section, concerning which the facts and weight of the fish can be substantiated.



WM. M. HUGHES.

P. S.—Dr. D E. Cone, of Fall River, Mass., saw this fish weighed, also Dr. McBurnie, of Philadelphia, Pa., before carrying to Newport, and it then weighed 67½lbs.

REPORT YOUR LUCK
With Rod or Gun
To FOREST AND STREAM,
New York City.

THE SPORTSMEN'S EXPOSITION.

The third annual Sportsmen's Exposition in Madison Square Garden, this city, is in progress as the FOREST AND STREAM goes to press. The exhibits are manifold and interesting, and are attracting large throngs of visitors. We give to-day a review of the principal exhibits. The thirty odd illustrations afford a capital example of the possibilities of the illustrated journalism of to-day. The work was necessarily done in a rush. The photographs were taken in one day and developed and printed by night; and the prints were given to the engravers early the following morning for reproduction as the half-tone engravings

UNION METALLIC CARTRIDGE COMPANY.

which are presented herewith. By this expedition it was possible to supply in the mid-week of the Exposition admirably comprehensive and accurate pictures of the individual exhibits. From these illustrations and with the text accompanying them readers who did not visit the show may gain a very satisfactory notion of just what it was.

The Exposition opened last Saturday with sixty exhibits in place. There is a noticeable divergence of the character of the exhibition this year from that of the original one; the show of 1897 is not so closely confined to the sports of the rod and gun as was that of 1895, although it is clearly manifest that the real interest centers about the gun displays, the powder exhibitions, and the hunting boats and the field equipments. One feature of the present Exposition is the largely increased number of trophies and prizes shown by representatives of all branches of sport, including rowing, fencing, swimming, yachting, la crosse, running, football, tennis and athletic sports in general; there are extensive collections of such trophies shown by individuals and societies. There is also a novelty in an exhibit of live game birds, including snow, Canada, Hutchings and blue geese; black brant, black ducks, mallards, domestic call ducks and others; and Mr. Verner de Guise shows English ring-neck pheasants, dark-necked pheasants and Mongolian pheasants. The rifle-shooting contests are attracting decided interest and promise to be a success exceeding the anticipation of the promoters. There is also revolver shooting, and fly-casting contests are held afternoon and evening over a miniature pond provided on the south side of the Garden.

The attendance at the Garden has been very satisfactory in number, and there is a noted improvement in its character. Many trade representatives are here and the Exposition has proved a meeting ground for dealers and sportsmen from far and near.

U. M. C. Company.

In arranging for a display of its manufactures at this year's exposition, the U M C. Company, of Bridgeport, Conn., devised something in the way of an exhibit that is not only novel, but decidedly striking. The arrangement of

LAFLIN & RAND.

the different kinds of goods manufactured by this company is bound to attract the notice of all visitors to the Sportsmen's Exposition.

The location and the amount of space occupied by the firm this year is precisely the same as in the expositions of '95 and '96. This year, however, the black and gold pagoda-like structures that held the U. M. C. Co.'s goods in those years are absent. In their place is a mammoth lozenge-shaped pyramid composed entirely of cartridges in the original packages, that is, in the paper boxes that contain 100 cartridges, and which are so well known to trap-shooters generally. The base is built of the green paper boxes containing Trap shells. The next few steps are built of the white paper boxes, lettered in red, that speak of the Smokeless shells inside. Next come the maroon boxes with Nitro shells, followed step by step by boxes of Acme, Black Club and High Base in order named. The whole is capped with more of the green boxes of Trap shells. The pyramid bristles with ammunition for rapid-firing guns from 1-pounders up to 12 pounders.

The pyramid occupying a square space, but being lozenge-shaped, there are necessarily four small corners to utilize. And here again the display is simple but effective, the pyramidal style being adhered to. Each of the four corners is occupied by a miniature pyramid of wads in the original packages, and each pyramid is surmounted by a glass globe filled to the brim with samples of the wads that go to form the base such globe is resting upon. The four kinds of wads represented are: white felt, field, pink-edge and black-edge.

The four corners of the space occupied by the U. M. C. Co. are marked by gilded pillars; on the top of each pillar is an electric light of high power, whose rays are softened by being inclosed in a ground glass globe. Each corner also contains a glass showcase tastefully arranged, and each distinctively of its own kind. No. 1, for instance, shows samples of the various kinds of military rifle ammunition manufactured by the company; No. 2 is devoted solely to sporting rifle ammunition; No 3 exhibits shells for shotguns, loaded and sectionalized to show wadding and powders used; No 4 shows the immense variety of caps and primers still in use for the firearms of the world. That showcase, No. 4 contains an excellent object lesson on the old adage of "many men, many minds," and we might add, "many guns"

In addition to the brilliant lighting obtained from the electric lights all over the Garden, and the lamps at each of the four corners of the space occupied by the company, an electric sunburst (no other name is so appropriate), hanging just above the apex of the central pyramid, adds greatly to the effectiveness of the U. M. C. Company's exhibit during the evening sessions.

It is unnecessary to add that Mr. J A. H. Dressel, the secretary-treasurer of the Sportsmen's Association, and also a representative official of the U. M. C. Company, is nearly always in evidence around the company's exhibit. But the exhibit itself is directly in charge of "U. M. C." Thomas,

CLEVELAND TARGET COMPANY.

the company's ballistic expert at Bridgeport, Conn., who is always on hand, and who is untiring in his efforts to explain the nature of his firm's exhibits to those interested in the same. We believe the originality of this year's exhibit is due mainly to Mr Thomas's consideration of this matter. Mr. Herbert F. H. Dressel, son of Mr. J A H. Dressel, assists Mr. Thomas in looking after the exhibit.

Laflin & Rand Powder Company.

In the space occupied by the Laflin & Rand Powder Co. are two very catching exhibits. The first is a working model of the entire plant of the company at Wayne, N. J., known as the Wayne Powder Works. The buildings and machinery are so faithfully reproduced in miniature that it is possible under the tuition and guidance of Mr. John Lyon, the master mechanic of the company at Wayne, and the gentleman whose deft fingers so skillfully framed the model, to pass, as it were, with the raw material from building to building until it finally becomes the finished product for blasting purposes for which this firm is noted. At Wayne nothing but blasting powder is manufactured. At Newburgh, N Y, and at Schaghticoke, Rensselaer county, N. Y., the company's black powders for sporting purposes are manufactured. The firm's W–A Smokeless powder is manufactured at Pompton, N J, under the superintendence of Capt. Aspinwall. Thus, in looking at Mr. Lyon's model of the Wayne Powder Works, it is just as well to remember that one is not looking at a reproduction of the entire plant of the company, even if those works do cover a great deal of ground and do employ about 125 hands. Mr. George Paterson, who has the superintendency of the entire operating plant of the Laflin & Rand Powder Co., makes his headquarters at Wayne.

After the model mentioned above, the second article of great interest is the beautiful rock of crystallized saltpeter, the interior of which has been hollowed out to admit of the whole being suffused with the rays of an electric light inclosed in a red globe. The effect is very beautiful indeed, the formation of the crystals being bold and rugged.

The remainder of the exhibit of this company is mainly made up of kegs indicative of the many products in the powder line manufactured by the company. The company's W–A always attracts attention from its peculiar features. As one lady expressed it: "It looks more like something good to eat than gunpowder!"

Visitors to Laflin & Rand's exhibit will be greeted by Ed Taylor, late of Cincinnati, but now, we are glad to say, of Jersey City, N. J. Mr. Taylor and Mr. John Lyon, whom we have referred to above, have charge of the exhibit.

Cleveland Target Company.

The Cleveland Target Company occupies the same position this year that it has done in past expositions. The articles exhibited by this firm, the makers of the bluerock target, may be briefly and effectively enumerated as follows: One magautrap; four barrels of bluerock targets, draped with yellow and black cloth; four expert bluerock traps, and Paul North. If we have omitted anything we are not altogether to blame; for, small though the number of articles exhibited may sound, the magautrap and Paul, or Paul and the magautrap (we don't care which way you put it), are sufficient to keep one's attention from anything else while in their vicinity.

An examination of the magautrap will show at once that changes, though slight perhaps, have been made in the construction of the trap. The attachment of an electric pull is the greatest improvement of all; but the magautrap as a whole looks far more businesslike than it did last year. So popular has "the bicycle trap" become that Paul North and the Cleveland Target Company will have to look out next

HAZARD POWDER COMPANY.

year for a novelty. Speaking of the number of traps now leased and in use by clubs, Mr. North informs us that his company cannot keep pace with the orders received. It may be as well to mention also that the Brooklyn Gun Club, of Brooklyn, N. Y., and the Yanticaw Gun Club, of Nutley, N. J., have each leased a magautrap and will shortly hold special shoots for the purpose of introducing them to the trap-shooters of New York and vicinity.

Of the expert bluerock traps, and of the bluerock targets themselves, nothing new can be said; all shooters know what these articles are, what they are like and what they can do. As for the black and gold drapery, Paul says he has to have that, as it suits his complexion.

Hazard Powder Company.

The Hazard Powder Company's exhibit is in the hands of John L. Lequin, secretary-treasurer of the Interstate Association, also secretary of the Hazard Powder Company; and of E. S. Lentilhon, assisted by B. H. Norton, the company's popular representative in the New England States.

The chief feature of this exhibit is the working model of a single-wheel rolling mill used in the process of mixing the ingredients of black powder. This mill attracts lots of attention and is an essential part of the company's exhibit. The back wall of the space occupied by the company is artistically decorated with kegs showing the varieties of powders manufactured by the company, among the black powders being its Electric, Duck, Trap, Kentucky Rifle and India Rifle (the latter for export). Of course readers of FOREST AND STREAM very generally know that the company's smokeless shotgun powder is the Blue Ribbon. They will be reminded of this fact by the draperies of blue ribbon that deck the showstand, on which one can see the raw material and the finished product, a brick-red, which it seems almost a misnomer to call "Blue Ribbon." It is perhaps in these exhibits of raw materials and manufactured products that most people take the greatest amount of interest; it is certain anyway that they are worth far more than a mere cursory examination.

It will not do to close this notice of the Hazard Powder Company's exhibit without mentioning that a portrait showing the familiar features of Col. Hazard, the founder of the Hazard Powder Company, forms part of the decorations in

VON LENGERKE & DETMOLD.

the rear of the exhibit. The artistic and effective arrangement of the many colored kegs of powder upon this wall is mainly the work of Mr. Lequin, the company's secretary.

Von Lengerke & Detmold.

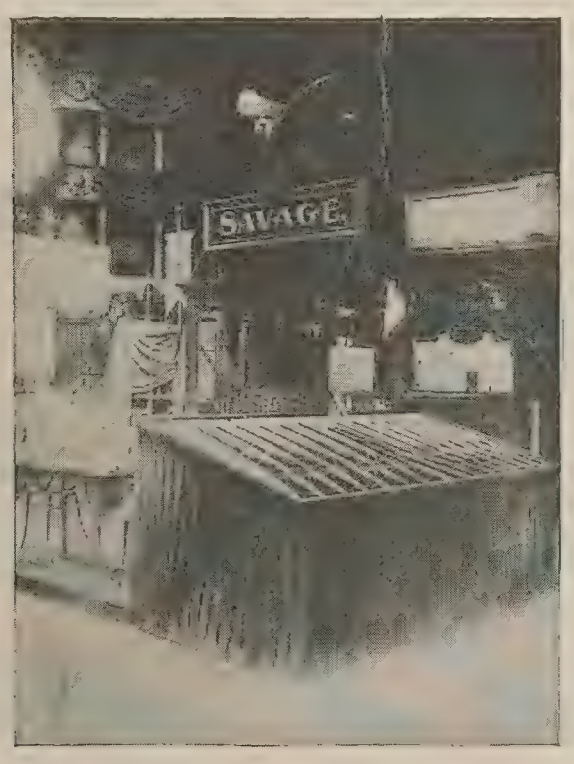
An exhibit which, from the very variety and excellence of the articles displayed, is bound to attract and hold crowds of interested spectators, is that furnished by the firm of Von Lengerke & Detmold, 8 Murray street. During the evening the joint signs of E. C. and Schultze powder, in incandescent lamps on a white and gold ground, are certain to catch all eyes. Once caught, there are other things to look at.

This firm makes a specialty of Francotte guns, and these guns need looking at only once to take the fancy of a lover

of shotguns. All sorts and grades of these arms are on view: single or double 8-gauges down to 41-gauges; hammer or hammerless; $80 or $500 grade; all works of the gunsmith who knows his business. Among the noted guns on view at this stand are two which respectively own Edgar Murphy and J. P. Knapp as master, and which, under the guidance of these prominent amateurs, made records to be proud of, winning the Larchmont amateur championships in 1895 and 1896. The gun exhibit is a large portion of this firm's display, but there's plenty more.

On the other side of the stand is what we generally call "John Wright's department," viz , the fishing tackle exhibit. And this year, as in the past, John Wright has laid out some of the prettiest pieces of work ever put together by a fisherman. From tarpon rods, the gradation can be followed by

M. ABBOTT FRASER.



steps until one comes to the delicate fly-rod that seems more like a toy than an article intended for practical purposes. The handles of these rods form no unimportant feature; they are of various kinds: solid cork fitted to the hand, as it were, while others have the usual round handles of cork, lapped with fine-drawn silver wire. Thoughts of Izaak Walton and *his* rod and of the present day farmer's lad with his bean pole flit through one's mind as one examines these highly finished specimens.

Another show case on "John Wright's side" contains samples of flies; silkworm gut in the raw and the finished article looped for use; Vom Hofe reels; spinning baits, etc. The special feature of this case is what looks to us like the tiniest rod and reel ever made; the rod is a split-bamboo with two tips, and it almost makes one's eyes ache to think of threading a single strand of silk through the rings.

At the end of the exhibit next the cross aisle is a full set of Mott's disappearing traps, with electric pull attachment; everything being in working order and an exact duplicate of the sets now in use at Elkwood Park. This part of Von Lengerke & Detmold's exhibit will attract special attention from this cause, intending competitors in next week's Grand American Handicap being sure to take more than passing interest in the working of these traps.

Speaking of traps reminds us that Von Lengerke & Detmold have on exhibition—loaned to the firm by the courtesy of Miss Annie Oakley—the first set of regular sparrow traps ever made in this country so far as we are aware of. These little traps are for all the world like miniature King's pigeon traps, and are painted green. They were made some twenty-three years ago, and were presented to Miss Annie Oakley by Frank Kleinz, of Philadelphia. Looking like toys, they are still perfectly practical little pieces of workmanship. Miss Oakley (Mrs. Frank Butler), who will make her headquarters at this exhibit, will undoubtedly be glad to show them to all interested.

Samples of E. C. No. 1 and of E. C. No. 2, and also samples of Schultze powder, together with cans of the same powders, cartridge cases, gun cases, and in fact all that a shooter

SAVAGE REPEATING ARMS COMPANY.

needs, go to make a delightful whole in the form of the exhibit of Messrs. Von Lengerke & Detmold. The exhibit is in charge of Justus von Lengerke, who will be assisted in answering questions by John Wright, Carl von Lengerke, Gus Greiff, Theodore Baron and Eddie Morehouse.

While in England last December, Justus von Lengerke made the acquaintance of the European woodcock. Two beautiful specimens of the bird were brought home by Justus in the flesh and mounted in remembrance of his trip. Although kept on ice, having been killed two weeks previous to their arrival in America, they weighed about 16oz. each on the scales in the store at 8 Murray street.

Savage Repeating Arms Company.

A neatly arranged glass case in space No. 72 displayed a full line of the Savage repeating rifles, both sporting and military, the identical rifle which successfully contested for the arming of the New York National Guard being one of the number shown. It is in excellent condition. A plate of ⅝in. steel practically illustrates the terrific power of the .303-caliber sporting rifle. It is perforated with numerous clean-punched holes, made by the soft-nosed bullets fired from this rifle. The great penetrative power is shown in a log in which is embedded a Savage .303 bullet, its course parallel with the grain of the wood measuring 46¼in. The different effects of the jacketed and soft-nosed bullets are shown in the wood; the latter spreading and showing more destruction along their path, but penetrating less. Besides the display in the glass case, a number of finely finished Savage sporting rifles are exhibited on a slanting, silk-covered table. Mr. Arthur Savage, the inventor, is in charge.

Bridgeport Gun Implement Company.

The B. G. I. Company's exhibit will be found at the Fourth avenue end of the Garden on the Twenty-seventh street side. Last year it will be remembered that the company was located about midway of the Garden on the Twenty sixth street side. Changed though the location is, the exhibit is soon found, the space chosen being well adapted for showing off the specialties of this company's goods, and attracting the attention of the public.

Shotgun enthusiasts and riflemen all need tools for their guns or rifles, and the B. G. I. Co. has made it its duty to find out what is wanted and then to supply that want with the best articles obtainable. Its show cases reveal what a variety of implements are actually needed by all classes of shooters.

The panels on the walls of the exhibit display considerable taste in the arrangement of the different articles exhibited. One panel contains loading tools for shotguns, such as all kinds of powder and shot measures, the micrometer measure being used interchangeably for all nitro or black powders and also for shot; a variety of closers (or crimpers, as they are very often called) are also on view on this panel. Another panel shows all kinds of cleaning rods, with scratch brushes, wool swabs, expansion felt swabs, twisted wire bristle brushes and field cleaners. Re-cappers, de-cappers, extractors, wad-cutters, etc., make this panel a neat one. The third panel may be called the rifle implement panel; it shows all varieties of cleaning rods for rifles, together with the necessary tools for casting bullets, pocket oilers, etc.

BRIDGEPORT GUN IMPLEMENT COMPANY.

The B. G. I. Company's exhibit is in charge of Mr. H. B. Cannon, who will, with the aid of his assistants, gladly give any information in his power to those who want to know anything about the goods manufactured and sold by the B. G. I. Co.

Winchester Repeating Arms Company.

The conclusion is obvious, taking the name of the above firm as the basis of our conjecture, that the exhibit of the Winchester Repeating Arms Co. at this year's Sportsmen's Exposition deals mainly with "repeating firearms," their ammunition and tools generally. Such, of course, is the fact, but Mr. David Daggett, the gentleman who has charge of the exhibit, shows also a lot of single-shot rifles, light-weight, weighing 5½ to 7lbs. each, that take the fancy of many small-bore enthusiasts.

The firm's specialty, however, is really its repeating rifles and shotguns, and many beautiful specimens are shown, the most beautiful perhaps being a .45-90, model 1886, that lies in one of the glass cases at the base of the main exhibit. It is the highest class sporting rifle made, is inlaid with gold, silver and platinum, while the stock and forearm are exquisitely carved and engraved. This rifle is a take-down, and is priced at $400. There are also other specimens of sporting rifles, all highly finished, and listed at from $400 to $80, any one of which the firm feels it no disgrace to attach its name to.

This year the Winchester Repeating Arms Company is making a specialty of light-weight rifles. Among the number shown to us by Mr. Daggett was a .45-70, model of 1886, that weighed only 7lbs.; other light-weights which we examined were the .38-50, .32-40 and the .32-38.

Another feature of the Winchester Company's exhibit are the new model half-magazine take-downs, which are made in any caliber and only weigh from 6½ to 7lbs. The handling of these rifles shows at once the vast difference between one of the heavy-weights and these new works of the New Haven firm. The advantage to a man who has to carry a rifle over mountains all day in having a light-weight instead of a heavy-weight is something that has to be tried to be appreciated fully. An extra pound at the end of the day weighs about four times that amount before camp is reached.

In Schuetzen rifles Mr. Daggett has something new to show. Matted barrels are not new, perhaps, but the coarse matting, done by special machinery, is something that no other firm in this country can boast of so far as we are aware. The company exhibits three new styles of matted barrels on this kind of rifle.

The company manufactures and exhibits other things besides repeating rifles and shotguns. In one of the show cases is the small sword-bayonet adopted by the navy; this little weapon is equally fitted for a trenching tool, a tobacco knife, to slice a beefsteak or cut a junk of salt pork, or to be used as a weapon to do a foe to the flag. It is little, but—!

Speaking of the navy naturally brings us to the "Lee straight-pull" rifle adopted by the U. S. N. This weapon lies on a table alongside the new model '95 and excites quite a lot of interest. It can be used as a repeater or as a single-shot, and is the most modern rifle in the way of military makes. The model '95 was tried very highly before the New York State Commission appointed by Gov. Morton to choose a small arm for the National Guard of the State. The records made by this rifle before the board are told in full in a pamphlet of which there are always some to be gotten at the Winchester Company's exhibit. Some of the catalogues are well worth carrying away as souvenirs, being works of art in the half-tone line.

WINCHESTER REPEATING ARMS COMPANY.

In sights the company exhibits a variety that is puzzling to any but experts. The chief curiosity in this line is a seven-leaf express sight for use in South Africa, the big game country of the world for the twentieth century.

A show case right alongside the main aisle shows some exceedingly pretty and fanciful stocks fitted to rifles of superb workmanship. Among the woods used are California redwood, teak, bird's-eye maple, English, Circassian and American walnut.

The two show cases that mark the corners of the space occupied by the company abutting on the cross aisle show different kinds of military and sporting rifle ammunition, and a variety of shotgun ammunition, with shells loaded and sectionalized to show wadding, etc. The specimens in these cases are samples of some of the things not already mentioned that are manufactured by the Winchester Repeating Arms Co. at its New Haven, Conn., works.

To assist him in answering questions, etc., Mr. Daggett has a large force, among the number being the champion target shot of the world, Rolla O. Heikes, who shows the repeating shotgun he handles so effectively to all who want to look at it. Others around the exhibit are Capt. B. A. Bartlett, an excellent shot with either rifle or shotgun; J. Hildreth, one of the company's representatives in the South; W. L. Cameron, its representative in Canada; W. Maynard, from the New York store; Mr. Clark, from New Haven, who has charge of the advertising department, and Mr. Irby Bennett, late of Memphis, now of New Haven; and others.

Before closing this necessarily brief review of a capital exhibit, we must remind readers of FOREST AND STREAM who are fond of trap-shooting to go to the Winchester exhibit and see, with the aid of the mutoscope, how rapidly and effectively Rolla Heikes snuffs out targets.

M. Abbott Fraser.

Entering the Garden from the Twenty-sixth street side and passing east along the north aisle, we come to the exhibit of M. Abbott Fraser, of Boston. Here are to be seen a great

H. H. KIFFE COMPANY.

number of heads and hides and of well-mounted birds, of which perhaps the most interesting are a pair of capercailzie, male and female. A snowy owl, remarkable for its unspotted plumage, is another striking bird.

Dressed hides of Virginia deer, caribou, and a buffalo robe hung over the rail surrounding the space, make an effective barrier between the aisle and the wealth of skin rugs and mats within the space. Among these a black wolf hide is noticeable.

The heads are those of deer, moose, caribou and one musk ox, which, on account of its size, we take to be a cow. It is remarkable for its blackness.

The H. H. Kiffe Company.

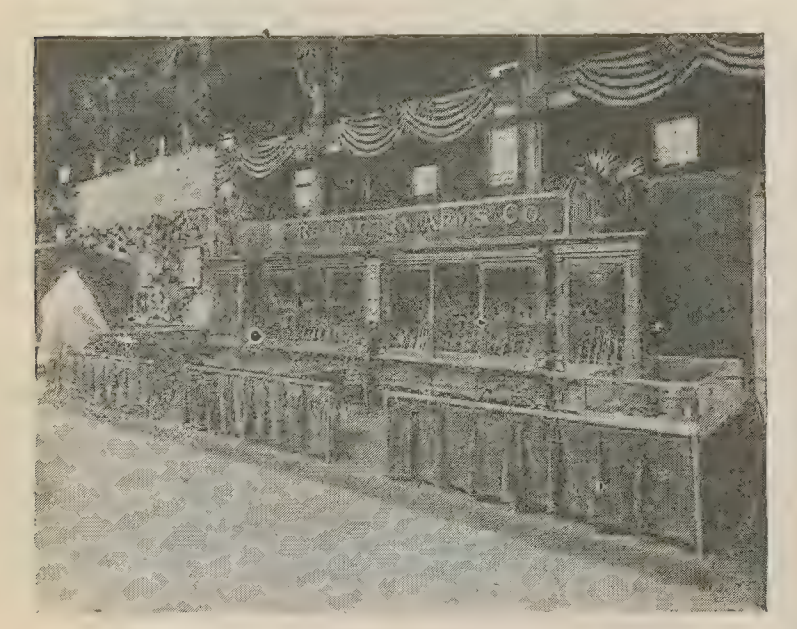
The H. H. Kiffe Co., manufacturers of and dealers in

firearms, fishing tackle and sportsmen's supplies, exhibited at space 17, which was decorated in red and maroon. The stand was in charge of Manager Disch, of the New York store. The principal exhibit was of fishing rods, including Kiffe's $1 split-bamboo, and also a split-bamboo weighing 4½oz. and retailing for $3.

A self-opening penknife was also shown, the blades opening and shutting under the influence of an electric current.

E. I. du Pont de Nemours & Company.

The interesting exhibit of E I. du Pont de Nemours & Co. is in the able hands of Mr. Pierre Gentieu, the gentleman who has filled the same position so courteously at previous expositions. Mr. Gentieu has reason to feel pleased with the general appearance of the exhibit this year. Occupying precisely the same space as last year, the nature of the exhibit and its character are necessarily much the same. A change, however, has been made in the upper part of the white and gold framework that adorns the rear of the ex-



E. I. DU PONT DE NEMOURS & CO.

hibit, and the change is for the better. The scroll work with the name of the firm and the age of the company—1802-1897—in gold letters on a white ground, call one's attention rather forcibly to the fact that one is looking at the exhibit of probably the oldest powder company in the United States; ninety-five years in one place—Wilmington, Del—may be said to be a record in the powder making line.

Until quite recently the firm of E. I. du Pont de Nemours & Co. was noted among shotgun men chiefly for its Eagle Ducking Nos. 1, 2 and 3. In the last two or three years it has rapidly forged ahead and now puts on the market a nitro powder that has found considerable favor, known as Du Pont's Smokeless. Trap-shooters all know of this powder, and probably there are some who think that the manufacture of this powder is the chief part of the products of the Du Pont Co. They have only to come to the exhibit this year to learn that actually the manufacture of nitro powders by the firm is but a drop in the bucket when compared with the blasting and black shotgun and rifle powders made at the Wilmington powder works. The nitro powder works, it will be remembered, are located across the river from Wilmington at Carney's Point, and are as complete as any similar works in the country. The kegs that adorn the rear of the exhibit tell the tale of what this company manufactures both at Wilmington and at Carney's Point.

The show case on the left of the exhibit is surmounted by a pretty piece of crystallized saltpeter. Below it are the two grades of charcoal used, the black and the red, together with the raw material (willow wood), a card announcing that only the branches of the tree are used for making charcoal. Still further below are the three ingredients for black powder: charcoal, sulphur and niter. Other articles displayed in this case are: Sphero hexagonal and cubical powders for high power rapid-fire guns; service gun cotton; smokeless powders for the new .30cal. rifles; samples of blasting powders; shot-

REMINGTON ARMS COMPANY.

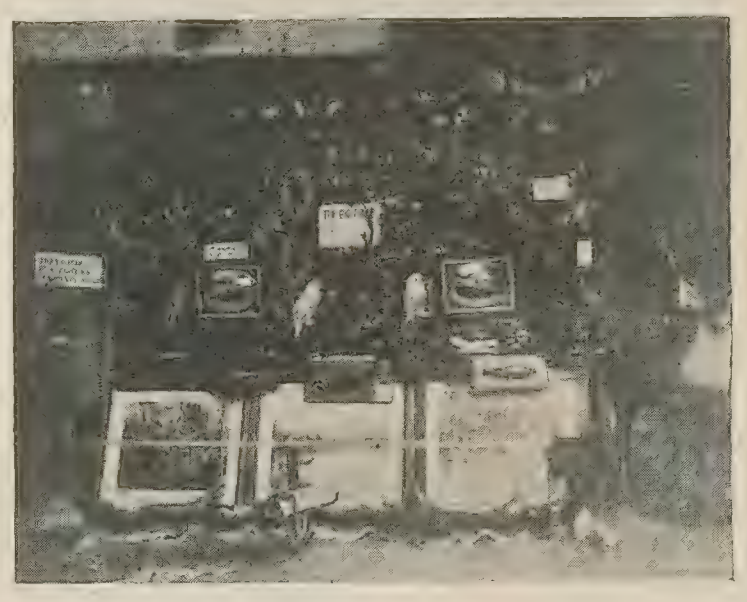
gun shells, loaded and sectionalized so as to show the wadding and powder; also the raw material for and the manufactured article known as Du Pont's Smokeless. This case contains a great deal in a comparatively small space.

Remington Arms Company.

As might be expected, the exhibit of the Remington Arms Company is in charge of Mr. H. B. Cannon. Scatter-gun men and riflemen will find much to interest them among the goods under Mr. Cannon's care. For shotgun devotees there is primarily the Remington hammerless ejector, several beautifully finished specimens being on view. These guns are really worth far more than a casual inspection, and it will well repay a shooter to spend a few minutes with Mr. Cannon and his assistants at the Exposition.

Riflemen don't need to be told what they will find in the exhibit of the Remington Arms Company. The company's factory at Ilion, N. Y., turns out some perfect specimens of high class Schuetzen rifles, and some of those Schuetzen rifles are on view. In the show case with some of these Schuetzen rifles are several innocent-looking derringers, one of the best pocket defenders in the world. Some of the specimens on view are finished so exquisitely that they look more like toys than deadly weapons.

Military rifles also form no unimportant portion of the



FRED SAUTER.

Remington Arms Company's exhibit The Remington military rifle is too well known for FOREST AND STREAM to devote much space to mentioning that part of the exhibit The steady march of improvement in firearms is one of the favorite subjects of conversation with all shotgun and rifle cranks. The effect of this march can be seen in the Remington Company's exhibit, the guns and rifles shown there now being capital instances of the strides that have been made in the past few years by the gunsmiths of the New World.

Fred Sauter.

At the east end of the Garden, in the space occupied last year by Messrs. C. G. Gunthers' Sons' cabin, is the large and varied exhibit of Fred Sauter, of New York. This ranges from fancy pieces and wolves and wildcats holding card receivers up to a large grizzly bear and a pair of mounted beaver kittens. A leaping deer is an excellent piece of work,

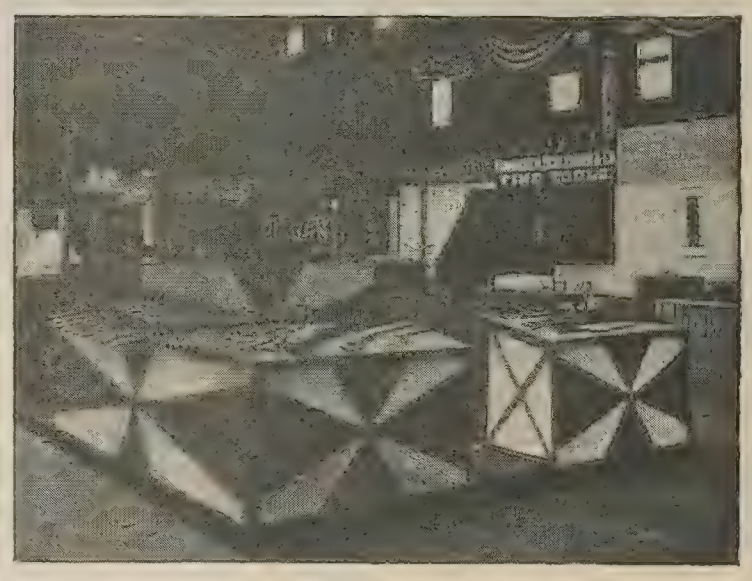
S. L. CROSBY—MAINE STATE EXHIBIT.

and so too is a leopard cat which has just sprung on the back of a fawn.

Among the interesting birds shown by Mr. Sauter is one of which we should like to know more. It is an unusual prairie hen, and is reported to have been obtained from Knapp & Van Nostrand, market men, of this city. It differs widely from the ordinary form of prairie chicken in having the ground color a bright tawny, almost a fulvous, which seems to blend into the black bars, the edges of which are thus made less distinct than in the common form. Can this pos-

W. W. HART & COMPANY.

sibly be a heath hen? If so it would be interesting to learn where it came from. The birds still remaining in Massachusetts are so few now that the killing of each one should be known. Before long we will be searching for their skins, as we do now for those of the great auk and the Labrador duck.



The Maine State Exhibit—Sumner L. Crosby.

Maine did herself credit as usual. Miss Crosby's contingent of guides were fully imbued with the idea of advertising the matchless game resources of their native State, which has become the Mecca in the East of all good sportsmen. Features of the exhibit were a log camp and a bough lean-to. With these the chief interest was shared by a fine exhibit of mounted game and game heads, the work of Maine's widely known taxidermist, Sumner L. Crosby. A unique background, effectively used for setting off the largest single grouping of heads in this exhibit, was made of balsam fir boughs, whose fresh green tint contrasted to the best possible advantage with the subdued color of the game.

A big buck from the Aroostook, mounted entire, was a forcible illustration of the size this game attains in Maine; also of the fact that the big buck does not always get away.

This old fellow had been raked the entire length of his back by a rifle ball. Mr. Crosby also had a large caribou, which was extremely well mounted, and a number of fish, including some very large trout. His big moose heads attracted a great deal of attention.

There were four of these and each had an enormous spread, the group averaging upward of 60in. These heads

STEVENS ARMS COMPANY. BAKER GUN COMPANY.

were also remarkable for the broad palmation of the antlers and number of points, as well as symmetry of proportions.

W. W. Hart & Company.

This exhibit occupies a great deal of room, and includes a number of ambitious pieces. We spoke last year in terms of high praise of the group of tigers, which still remains the most striking and probably the best group shown in this space. There is a cage which contains a tigress lying down, with a cub sitting up beside her. It is an excellent piece of work The roaring lion, and a group of two brown bears playing with two cubs, have been spoken of before. Both are good. While we have never seen a calling moose, we are disposed to give high praise to this figure. The anatomy of the body is well done, and judging this piece by what we have seen of whistling elk, the attitude is good. In this exhibit is a large musk ox head, and the great moose head which we measured some months ago and described in these columns. There is a good head of a calling mule deer, and an excellent bear's head. Two groups in this exhibit, each representing a panther fighting with a grizzly bear, attracted much attention, and many comments were heard about them.

The Baker Gun and Forging Company.

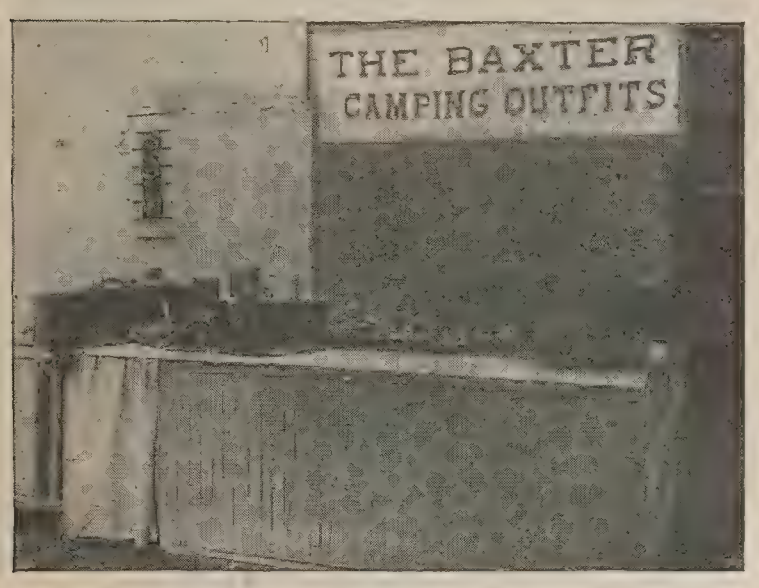
The Baker exhibit was found at space 91, in company with the exhibit of the Stevens Arms Company Mr. J. F. Carraher was in charge. Col. W. T. Mylcrane, secretary of the company, was also present at times during the week of the exhibition. Four lines of guns were shown, a hammer gun listing at $25, a hammerless with ordinary safety listing at $30, and a hammerless fitted with the special Baker block safety listing at $35, and lastly the "Paragon" pigeon gun, listing at $80. This latter gun had fluid steel barrels and was as handsome a gun as one could desire both in outline and also in point of checking and finish. Baker guns range in weight from 7 to 9¼lbs.

The block safety gun shown had exactly the same lock plate as that used in a hammer gun. In a sample gun it was

THOS. W. FRAINE.

cut away to show the working of the lock mechanism, which is remarkable for simplicity.

There are only four pieces to each lock: the main spring, sear spring, sear and hammer. The back safety is always in front of the hammer, except at moment the trigger is pressed, and effectually guards against premature discharge resulting from accidental or other causes. Of course these guns are provided with the ordinary safety in addition, but as the block safety works from the trigger the use of the gun is in no way complicated.



All Baker guns are bored for nitros, and all are targeted with nitros.

Thomas W. Fraine.

Mr. Fraine's exhibit is one of the smallest in the Garden, but what it lacks in quantity it makes up in quality, for it is

extremely choice. We spoke last year of the admirable work shown in this exhibit in the face modeling of the caribou, and this year Mr. Fraine shows four heads, representing three species, which call for high praise. One of these is a big mountain ram's head, turned, in which the profile of the face and the modeling of lips are excellent; a ewe, summer killed, is also very good, and shows a great deal of feminine character. A Virginia deer head, turned, also shows this sex character very admirably. A white goat's head, long and solemn looking, is a fine piece of work. Mr. Fraine, who we believe was the first man to depart from the stereotyped position of the mounted head and to turn the face a little to the right or left, has brought out a new idea in shields. The moose head referred to is mounted on what appears to be a slab of yellow rock, and a Virginia deer's head on an irregular rough shield of dull green, with pine boughs in dull gold overlying the green background. The fish shown here are excellently done. Trout of four kinds are shown, one a great rainbow trout sent on by the Flint & Pere Marquette R. R. Co., and caught near their line.

About the Maine cabin are a number of deer, moose and

W. E. BAXTER.

caribou heads, a mounted caribou, shown last year, and a number of other small pieces.

In the trophy room are a number of heads, none of them calling for special mention except a great white wolf's head, which from its label we may conjecture to have been brought back from the Barren Grounds by Mr. Caspar Whitney. Here too is a pair of extraordinarily abnormal elk horns.

Taxidermy.

The exhibits of taxidermy at this year's show present a number of features of interest. All over the Garden are to be seen the conventional deer, moose and elk heads used for decorative purposes, but it is to the displays shown by the various taxidermists that special attention has been called. There certainly has been a great advance in this art during the past few years, and while of course there remain in the trade not a few of the old-fashioned "stuffers," who in mounting an animal are satisfied if they turn out something that looks like a pillow on four sticks covered with the neatly smooth hide of the animal in question, there are others who really strive to follow nature and who model all the anatomy of the beast that they are mounting with a care which almost equals that taken by the sculptor. Indeed there is one taxidermist in this city—Mr. Storck—who, following out this idea, has produced at least one admirable figure in bronze. We had occasion last year to call attention to this artist's work as then shown in the admirable group of tigers in W. W. Hart's exhibit, and which he again exhibits this year.

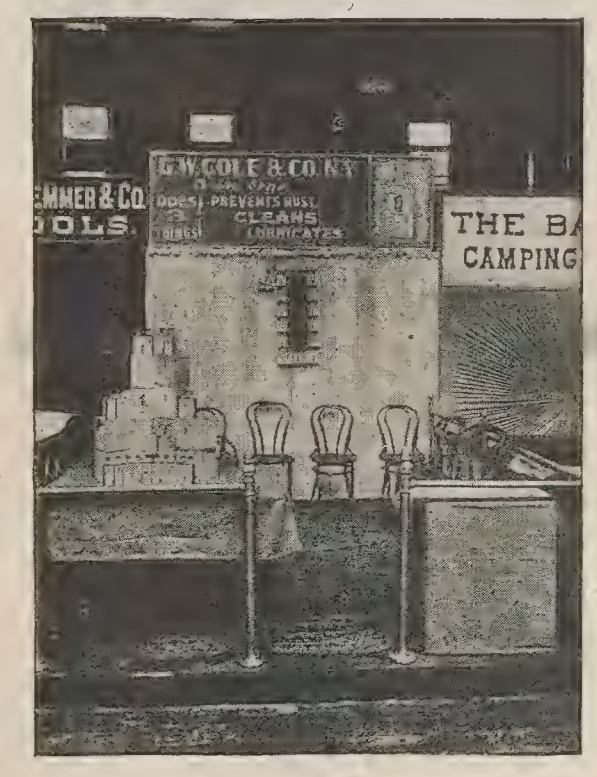
Sculpture and taxidermy are arts closely akin. The one is carried a little further than the other, but only in that the actual covering of the bird or animal is laid over its perfectly modeled body. In both arts there is always the danger of depicting too much action, since violent action implies the completion of the act. Repose or very slow motion may therefore be much more successfully attempted than violent action, although the temptation to the ambitious artist is always strong to strive to carry out his conception of some

PARKER GUN COMPANY.

striking act, as a panther springing on a deer or wolves pulling down a buffalo.

Parker Brothers.

The gun exhibit of Parker Bros. is on the same space occupied by them at last year's exposition. This year, however, it is differently arranged, the guns being displayed on two diamond-shaped racks and a circular one which revolves. They rest nudely in their racks, beautiful works of art, fine workmanship and utility, enveloped only in the many glories that so strictly appertain to the old pioneer American gun. Being in plain view, with no obstruction to interpose, is much to their advantage, as the closer the inspection the more thoroughly is the observer impressed with the perfect fitting, the elegant engraving, rich material used in the construction, artistic designing, and their general excellence.



There are displayed in all eighty guns, ranging in price from $50 to $400. In gauges they are from 8 to 20, and in weight from 5¼ to 14lbs. The smaller bores are models of combined elegance and lightness, and withal they are practically useful far beyond common knowledge. These dainty, racy small-bores attract a great deal of attention, particularly from the ladies, who are yearly becoming more and more interested in outdoor sports. Every gun in every detail, even to the most trifling, whether concealed or not, is sharply and cleanly finished, each part fit-

SCHOVERLING, DALY & GALES.

ting to its fellow with absolute precision. The barrels are in different kinds of material, durable, highly finished and pleasing in their artistic lines. The Whitworth fluid steel guns, which have so conspicuously won their way to the front on their merits in the past two years, are of course the *piece de resistance* They are superb weapons, being made of the very best material throughout, beautiful and artistic in design, and embellished with the highest skill of the engraver. In balance, workmanship, design and shooting capabilities they are all that the most fastidious shooter could wish for.

Capt. A. du Bray is looking after the exhibit, and is delighted to chat with his friends and with the endless stream of admirers of the Parker gun who constantly engage his

G. W. COLE & CO.

attention. His enthusiasm never wanes, and for his faith in the excellence of the Parker gun he is ever pleased to produce proof in the gun itself. No one can hear him "talk gun" without being a gainer.

Baxter Camping Outfits.

The above title is displayed over a space devoted to samples of different kinds of camp outfits of marvelous compactness and ingenious construction. The Convertible Table Kit Case, only 7in. in thickness and 11×30in. otherwise, carries an outfit for serving from one to twelve persons and cooking for them. The case, which has many of the appearances of a traveling case, is so cunningly devised that when

A. G. SPALDING & BROS.

opened and set up it forms a table with legs and braces complete. In the metal articles—stove, pans, covers, etc.—no solder is used. All the parts are stamped out whole with special dies. The stove is a wonder of collapsable legs, telescopic stove pipe; an oven for baking, the heat of which can be regulated as desired; a grate and an ashpan; and in it are packed nicely a whole array of utensils, a bread pan, dish pan, skillets, wire broilers, flesh fork, basting spoon, butcher knife, coffee boiler with detachable handle and spout, water bucket, soup kettle, salt, pepper and sugar boxes, six coffee or soup cups, and six each of spoons, dinner plates, knives and forks, and a tablespoon, cake turner, dipper cup, can opener and folding tripods for extra use in cooking.

Two movable gas burners are so designed that they can be used in the house with the outfit either for boiling or baking, thus economizing in time and fuel and giving the stove a broader utility in both home and camp life. All the parts are most thoroughly made.

For compactness, thorough workmanship and practical usefulness, these outfits are deserving the consideration of all who have an interest in outdoor life, or who desire a compactly useful outfit for the home. Dr. W. E. Baxter is in charge, and is pleased to display to all the practical usefulness of his outfits.

A. G. Spalding & Bros.

Confine themselves this year to a display of golf goods. Their exhibit occupies an advantageous position at the east end of

GAS ENGINE AND POWER COMPANY.

the center aisle, and is characterized by an extremely harmonious and pretty arrangement, reflecting credit on the good taste of Mr. J. W. Curtis, who is responsible for it.

The setting of the exhibit represents a putting green, while around the back and sides are shown clubs and irons, balls of imported and domestic manufacture, and caddy bags, as well as shoes and golf coats of striking pattern.

All of the clubs shown are of Spalding manufacture. The shafts are of the finest selected woods. The very best English and Scotch workmen are employed, and in many cases the English models have been improved upon.

"Linkers" or captive golf balls, devised for home training, were an interesting feature in the display. The golf ball is attached by a cord to a machine provided with a dial that records in feet the distance an untrammeled ball would be likely to travel as the result of a stroke.

The exhibit was in charge of Mr. C. S. Cox, but at the time of writing these notes Mr. H. S. Wells was more particularly in evidence.

G. W. Cole & Company.

Messrs. G. W. Cole & Company exhibited their well-known "3 in 1" compound at space 113, which was decorated with a color scheme in red, white and blue. Prominently displayed was a clever reproduction of their trade mark done in small bottles.

As most sportsmen know, "3 in 1" is invaluable for cleaning the residue of smokeless or black powders from guns.

It is the cleanest thing of the kind to handle, and in the case of guns only one application is necessary at the time of cleaning, as it is an effective rust preventive. In addition to cleaning and preventing rust, the compound is of value as a lubricant, and is especially useful for application to the mechanism of repeating rifles or the locks of shotguns.

"3 in 1" is used by the principal gun clubs, and the manufacturers have as yet to receive any reports that are not complimentary to their product. They have testimonials from upward of 300 gun clubs.

W. H. MULLINS.

During the show from 10,000 to 15,000 sample bottles will be given away. Sportsmen who are not so fortunate as to be present may secure samples by inclosing a stamp for postage to G. W. Cole & Co., 111 Broadway, New York.

Gas Engine and Power Company.

The two handsome and graceful boats shown by the Gas Engine and Power Co., of Morris Heights, N. Y., are the Diana, a 25ft. launch of 4 horse-power, and an 18ft. boat of 2 horse-power. They illustrate the degree of perfection attained in the construction of modern power launches and pleasure boats. Naphtha launches have become known the world over, and the models shown by the Gas Engine and Power Co. prove them to be well worthy of their broad reputation for beauty of lines and finish. There is also shown a triple expansion marine engine of the company's make.

Marlin Firearms Company.

The Marlin Firearms Co. occupies space No. 58, the same that they occupied last year, wherein they are receiving calls from a host of their friends. Their display is notable for both excellence of quality and good taste in the manner of exhibiting it. No attempt is made to exhibit a complete collection of their large line of guns, but there is enough variety of different calibers, styles and exquisite finish to delight the heart of the most fastidious rifleman. Among the seventy-five repeaters shown are many novelties and original patterns. The taste for artistic ornamentation, which this company has done so much to develop and foster, has reached such a stage that the company shows finer and more expensive work than ever before, and the larger part of the exhibit is a masterpiece of the artistic. The hand engraving is elaborately beautiful, and contains pictures of the large and fierce animals from the tiger and the elephant of the East to the

MARLIN FIREARMS COMPANY.

better known American specimens, the moose, caribou, elk, deer, etc.; and the little .22cals. bear engravings of the game for which they are used, the squirrel, grouse, rabbits, etc. The most expensive have the central figures and general outlines in inlaid work of gold, silver, platinum and aluminum, giving pleasing color and tone when contrasted with the dark polished steel or the rainbow hues of the case bordering. For those preferring the quieter style there are designs with embossed figures relieved with backgrounds of scroll work, leaf designs and beaded surfaces, offering a tempting variety, while the man with limited means sees much to admire and use in the neat line engraving, highly decorative, but inexpensive withal, and the sterling material and workmanship. Circassian walnut, brought from southern Europe; American walnut, with the beautiful feathery effects found in its stumps and crotches; bird's-eye maple with its delicate figures, and the sycamore with its snakeskin appearance are used in the woodwork.

These rifles are in all weights, lengths and sizes, the extreme of smallness being a well-tried take-down which has seen service in the Rocky Mountains in the hands of Mr W. A. Wright, well known as Mr. Carlin's guide. It is a .30 smokeless, 18in. barrel, holds four cartridges, and weighs a trifle over 6½lbs. It has the appearance of a large field glass when in its 19in. case, and, though thus appearing like a toy, Mr. Wright declares that it will kill grizzlies or moose as clean and quick as the larger rifles. For deer and smaller

NEW YORK YACHT, LAUNCH AND ENGINE COMPANY.

animals he has a similar barrel in .25 that he uses on the same stock and action. The exhibit also contains an assortment of their pocket revolvers, samples of the Marlin Rust Repeller, and a variety of rifle sights. Mr. Harry Marlin is in charge.

Schoverling, Daly & Gales.

Messrs. Schoverling, Daly & Gales had a very complete exhibit of sporting and athletic goods, shown to good advantage in spaces 59 and 60, facing the center circle of the amphitheater. The exhibit was in charge of Mr. T. W. Stake.

Perhaps the feature of greatest interest was a case of Charles Daly guns, valued at $8,000, and said to be the most costly similar exhibit in the Garden. This case contained fifty guns, ranging in price from $100 to $400, a number of which were made especially for the Exposition.

Something new in the shape of a hammerless three-barrel Daly gun attracted a great deal of attention, both on account of its beauty of finish and also because it is the first three-barrel hammerless ever constructed. Guns of this type will be ready for the fall trade.

A very fine line of fishing rods of their own manufacture was also a noteworthy feature of this exhibit. These rods listed at prices ranging up to $40, and some of the dainty little split-bamboos ran as light as 2oz.

Messrs. Schoverling, Daly & Gales are agents for the Horton Mfg. Co., and a full line of Bristol steel rods was shown. This included some very handsome rods with pearl handles and oxydized silver finish.

They are also agents for Wright & Ditson, and exhibited tennis goods bearing the trade mark of that well-known firm. A very complete assortment of golf clubs of their own manufacture was also shown. Mr. A. J. Green had charge of the fishing tackle department, and Mr. Dennis Singleton tennis and golf.

Martin Automatic Reel Company.

The Martin Automatic Reel Company, of Ilion, N. Y., exhibited their automatic reel at space 71. The exhibit was in charge of Mr. G. W. Warren. Mr. H. W. Martin, the inventor and patentee, was also present. Various styles of 25 and 50yd. reels, both plain and engraved, were shown. The finer reels were handsomely engraved and finished, and marked with monograms or special designs at the option of the purchaser.

From the time of its invention, six years ago, this reel has been in the hands of experts, and as a result of practical tests it has been improved till to-day it is perfect in detail—a good, strong, serviceable reel of remarkable merits. In it the automatic principle is carried further than heretofore, while the best features of the ordinary reel are also embodied It can be made free-running for casting, and has an adjustable brake which acts as a drag.

As an automatic reel the main spring can be wound or unwound without touching the line, thereby producing any tension desired on a long or short line. This is accomplished by turning the main spring drum, which is provided with a milled edge. The spring may also be wound by drawing out the line in the usual way. Catching or entangling the line is entirely obviated by an ingenious device of housing the line spool.

An entirely new and important feature in this reel is the friction clutch, which permits the line being drawn out after the main spring is wound up to its full tension, thus effectually guarding against the danger of breaking. This feature practically gives command of an endless spring, as the line can be drawn out to any length whatever, and afterward returned automatically up to the extent of the spring; after

COLT'S PATENT FIREARMS COMPANY.

which, if more line is to be taken up, the main spring may instantly be wound by a few turns of the drum.

The reel has received the highest recommendations from expert anglers, who have used it during the past two years. The parts are interchangeable, and each reel is fully guaranteed.

J. Stevens Arms and Tool Company.

The J. Stevens Arms and Tool Co. occupies a space with the Baker Gun and Forging Co., a little to one side of the center of the Garden. They display nearly a full line of their products—rifles in different calibers, weights, lengths, designs and purposes. There are take-down models for the convenience of the traveler and for convenience in having different caliber barrels adjusted to one stock. There are light bicycle rifles, delicately slender, yet thoroughly effective for practical use. There are detachable skeleton stocks so made as to require no room for packing them; others of rare wood were of most pleasing design and rich elegance of finish.

Among the lot are some Schuetzen rifles, elaborate of stock and butt plate, the heaviest rifle being about 14lbs. in weight, and having a record of placing ten shots within a 2½in. circle at 200yds. From that heavy weight are rifles of different weights down to 4½lbs., all, however, whether cheap or expensive, having in common the same quality of barrels, perfect rifling and accurate powers of shooting.

Another rifle is neatly fitted with telescopic sights. The smaller models of pocket rifles, in 10, 12, 16 and 18in. barrels, weighed only 2½lbs., and are in .22, .25 and .32cals. They are provided with light skeleton butts. The Favorite rifle, which retails for the small sum of $6, has the same quality of barrel and rifling as is furnished with their finest gun.

Gallery pistols of the Gould, Lord and Conlin models also are in the exhibit. One, a Gould model, is elegantly finished in gold and pearl, and exquisitely engraved. There are delicate, slender pistols, weighing but a few ounces, made for bicyclists and for target practice, and still smaller pistols of 3½in. barrels and 7oz. in weight.

The rifles are laid on inclined tables and make a most interesting display of the guns whose accuracy has a world-wide fame. All the details of shotgun and Schuetzen butt plates, palm rests, different kinds of sights, designs of stocks, styles of barrel, mechanism, etc., for target or field use, are in evidence. The exhibit is in charge of Mr. Charles Folsom, who has charge of the company's New York office at 89 Chambers street, New York.

Heublein & Bro.

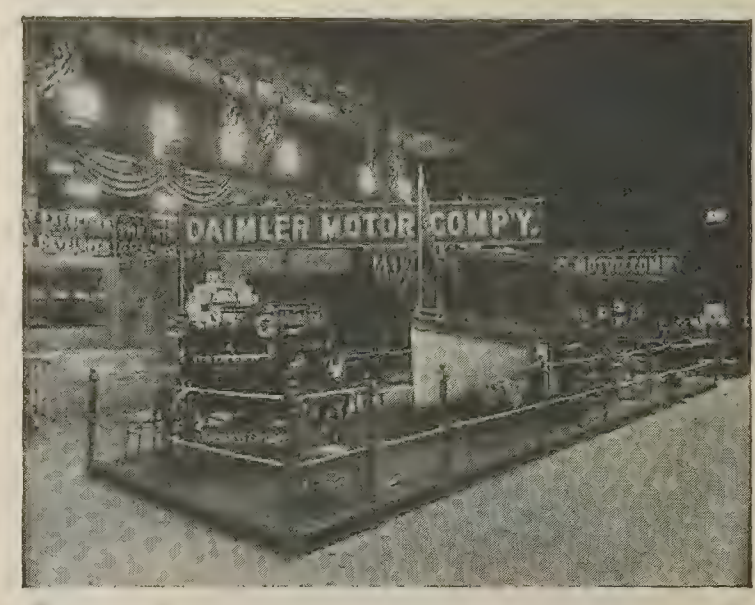
Messrs. Heublein & Bro. show an assortment, in original packages, of creature comforts for home and woods consumption.

New York Yacht, Launch and Engine Company.

This exhibit comprises a 21ft. mahogany-finished launch, with 2 horse-power Wing marine gas engines; 16ft. mahogany-finished yacht, tender or rowboat; 4 horse-power Wing marine gas engine; 25 horse-power Otto marine gas engine; Foster reversing propeller wheel and three cases of outward thrust propeller wheels.

The Wing marine gas engine is an innovation for power in small boats; while combining all the features of other gas engines, it has several points for which superiority is claimed. Bearings and working parts are all outside, and can be gotten at readily. Working parts of electro sparking device are also outside of engine, and, not coming in contact with heated gases, last longer. In gas engines this part of the mechanism is the one to give trouble, but with the arrangement of the Wing any complication from this

INTERSTATE ASSOCIATION HEADQUARTERS.



source is done away with. The impulse is taken on the upward stroke, thus avoiding the jar. There is no complicated noisy reversing gear, the Foster reversible screw being used. There is no odor from this engine. It is very small and compact, and gives great speed to a boat. With this engine the center of gravity can be very low down in the boat.

The Case propeller wheels, here shown, have never failed to show greater speed on the steamers to which they were fitted than any propellers ever before tried. The Case wheel throws all theories to the winds, says that the rearward thrust is mechanically and scientifically unwise, in that it is not against solid, but against receding water, whereas with the outward thrust the resistance is always against solid water, and the cant of his propellers toward the hull instead of from it, or forward instead of abaft a perpendicular line, is so radical, and yet so successful, that the experts are completely nonplussed.

The Daimler Motor Company.

The commanding feature of the exhibit of the Daimler Motor Co., of Steinway, N. Y., is the launch Maud, which in model, workmanship and machinery is in all respects a beauty. The boat is 33ft. in length, 8ft. beam and of 2½ft. draft. The propelling machinery is a 7 horse-power Daimler motor, burning gasoline, and giving a speed of nine knots an hour.

There are also shown Daimler stationary kerosene

DAIMLER MOTOR COMPANY.

motors and a horseless carriage, after the model of those which were in the recent French horseless carriage competition.

The Daimler motor for marine purposes has been proven not only to develop great steady power and speed, but also to be a safe, clean and economical medium for boat-propulsion. It has no boiler or coil, does not carry high pressure, and therefore is not subject to Government inspection, nor does it require a licensed engineer or pilot. Anybody, after a few hours' instruction, is able to operate it, as it requires very little attention, and its simplicity of construction enables everybody of ordinary intelligence to be his own engineer.

Mullins's Boats.

The showing made by W. H. Mullins, of Salem, O., comprises a line of his patented stamped and embossed metal "get there" safety duck boats, "double-ender" pleasure rowboats and yacht tenders. There is a yacht tender of aluminum 11ft. long, 46in. beam and weighing 80lbs. The same boat is made in manganese bronze, weight 145lbs., and in galvanized steel, same weight. All of the Mullins boats are made each in the three metals, the manufacturer recommending the aluminum craft for inland waters, and the manganese bronze for salt water; this bronze is the same metal that was employed for sheathing the Defender up to the waterline.

The Mullins boat which gets the most notice and awakens the keenest interest is a "get there" ducking boat, equipped with one of Frank Lawrence's grass boat blinds. This is a

FOREST AND STREAM'S EXHIBIT.

combination calculated to put one within shot of the wariest and wisest of wildfowl. Of Mr. Frank Lawrence himself, who is in charge, it needs not be said that as a grass-suit duck hunter he has had such experience that at this particular time duckdom is rejoicing that he is chained to business in the Garden as an expositor of the merits of the Mullins craft.

"Forest and Stream."

The FOREST AND STREAM occupies space No. 73, near the center of the Garden. Its exhibit this year is confined very closely to the journal itself. The space is arranged as an office, in which the series of bound volumes for the twenty-four years occupies the central place. Among the

MARTIN AUTOMATIC REEL COMPANY.

pictures shown is a striking water-color painting of Michigan grayling by Mr. R. Porteous. There are two original drawings by W. Townsend, in his happy vein of picturing wildfowl, entitled "Here They Come" and "There They Go." Mr. Townsend found his suggestion for these in one of the bright sayings of a FOREST AND STREAM writer that it takes two to shoot ducks, one to say "Here they come" and the other "There they go." The series of extremely interesting wild game pictures shown is the work of Mr. E. Hofer in the National Park. The animals photographed comprise buffalo, deer, elk and antelope, and the series as a whole is deserving of careful study. The diploma received by the FOREST AND STREAM at the World's Fair is shown. The south side of the space is devoted to the use of the American Model Y. C., who make a most interesting display of models and winning boats, a detailed description of which will be given in our yachting columns next week.

There were also shown bright and early Wednesday morning copies of the FOREST AND STREAM with these thirty-one half-tone illustrations of the show.

Colt's Patent Firearms Company.

The exhibit of the Colt's Patent Firearms Co. this year is substantially that of previous years. Mr. C. E. Willard, of course, is the presiding genius. The cases contain a full and handsome assortment of Colt's revolvers from that historic and always interesting relic, the original arm of 1836, up to the police model made for the New York force in 1896. The rifle display shows a number of handsome models, among which the white stocks, Mr. Willard tells us, are particularly favored by the fair visitors.

Tatham & Bros.

Messrs. Tatham & Bros., of Beekman street, New York, show a complete assortment of their well-known patent finish drop shot and chilled shot. The chilled shot is specially adapted for use with nitro powders, as its superior hardness enables it to retain its spherical form, and insures greater penetration.

Le Roy Shot and Lead Works.

The Le Roy Shot and Lead Works displayed shot of their manufacture to good advantage on the sides of a pyramidal structure erected within a gold and ebony pagoda at space 56. Sixty sizes of drop, buck and chilled shot were shown, ranging from balls weighing over 1oz. apiece down to microscopic dust shot counting from 3,000 to 5,000 to the ounce.

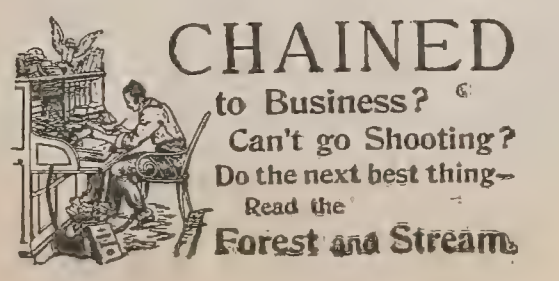
The exhibit was in charge of Manager O. D Delano, assisted by Assistant Manager R. Sheldrick.

The Interstate Association.

THE Interstate Association is in the Garden for business, like the rest of the exhibitors. It has, however, nothing to exhibit except perhaps its manager, Elmer E Shaner, who sits at the desk and receives entries for the Grand American Handicap.

Our illustration shows the space the Association occupies when tenanted by Mr. J. A. H. Dressel, president of the Association; and Messrs. A. W. du Bray, Elmer Shaner and U. M. C. Thomas.

Fly-Casting at the Exposition.



Fly-casting was begun on Monday and will continue through the week. The programme for the contests is:

Wednesday, at 3 P. M.—Bass fly-casting contest for distance only, open to those who have never made a record of over 70ft. in any contest. At 8:30 P. M.—Bass fly-casting contest for dis'ance only, open to all.

Thursday, at 3 P. M.—Single-handed trout fly-casting contest for accuracy only, open to all, distances 50and 65ft. At 8:30 P. M.—Switch casting contest for distance, open to all.

Friday, at 3 P. M.—Obstacle casting for distance, open to all. At 8:30 P. M.—Obstacle fly-casting contest for accuracy and delicacy, open to all. Casts will be made under bushes.

Saturday, at 3 P. M.—Single-handed long-distance trout fly-casting contest, open to all. At 8:30 P. M.—Single-handed long-distance trout fly-casting contest, open to all. Rods not to exceed 11ft. 6in. in length.

The Kennel.

FIXTURES.

BENCH SHOWS.

March 24-27.—PITTSBURG.—Duquesne Kennel Club.
March 17-20.—LOUISVILLE.—Kentucky Kennel Club.
March 30-April 2.—BALTIMORE.—Baltimore Kennel Association.
March 30-April 2.—KANSAS CITY.—Kansas City Kennel Club.
March 31-April 3.—SAN JOSÈ.—Santa Clara County Poultry and Kennel Club.
April 7-10.—STOCKTON.—Stockton Kennel Club.
April 14-17.—LOS ANGELES.—Southern California Kennel Club.

FIELD TRIALS.

Sept. 6.—Manitoba Field Trials Club, Morris, Man.
Nov. 2.—Monongahela Valley Game and Fish Protective Association's trials, Greene county, Pa.
Nov. 8.—Union Field Trials Club's trials, Carlisle, Ind.
Nov. 15.—E. F. T. Club's trials, Newton, N. C.

THE CHICAGO BENCH SHOW.

THE eighth annual bench show of the Mascoutah Kennel Club was held in Battery D, on March 9 to 12. There were 904 entries catalogued, though there was an unusually large percentage of absentees.

The judges and their classes were as follows:

St. Bernards, mastiffs, bloodhounds, Newfoundlands, greyhounds, deerhounds, Russian wolfhounds, poodles, Boston terriers, dachshunde, Dalmatians, whippets, Italian greyhounds and miscellaneous, Mr. H. W. Lacy; pointers, English, Irish and Gordon setters, foxhounds, Chesapeake Bay dogs and beagles, Major J. M. Taylor; collies and Old English sheep dogs, Mr. Henry Jarrett; Great Danes, Dr. Nicolai; fox, bull, Black and Tan, Irish, Scottish, Skye, Bedlington, Dandie Dinmont, Yorkshire and toy terriers, and French bull dogs, Mr. T. S. Bellin; bull dogs, Mr. E. A. Woodward; pugs, Mr. A. E. Pitts; cocker, Clumber, field, Irish water, Blenheim, King Charles, Prince Charles and ruby and Japanese spaniels, Mr. E. M. Oldham.

There was a good attendance, which was noticeably fashionable.

The sporting classes had the following

AWARDS.

AMERICAN FOXHOUNDS.—NOVICE—1st and 2d, Walker & Hagan's Flash and Joe Blackburn.—OPEN—*Dogs:* 1st and 2d, Walker & Hagan's Joe Blackburn and Raleigh. *Bitches:* 1st, Walker & Hagan's Flash.—CHALLENGE—1st, Walker & Hagan's Big Strive.—LOCAL—*Dogs:* 1st, A. Krueger's Loud.

POINTERS.—PUPPIES—*Dogs:* 1st, H. F. Gillette's Blucher; 2d, T. Donoghue's Dan Kent *Bitches:* 1st, G. J. Gould's Furlough Maud; 2d, T. Donoghue's May Kent. Res., H. F. Gillette's Flora.—NOVICE—1st, Electric City Kennels' Lad of Bang; 2d, G. J. Gould's Furlough Bloom. Res., F. G. McArthur's Ightfield Blossom.—OPEN—*Dogs* (55lbs. and over): 1st, G. J. Gould's Furlough Mike; 2d, C. Heath's Heath's Roswell; 3d, Electric City Kennels' Lad of Bang. *Bitches* (50lbs. and over): 1st and 2d, George J. Gould's Ightfield Diana and Furlough Bloom; 3d, Fred. J. McArthur's Ightfield Blossom. Res., Monocacy Valley Kennels' Queen of Monocacy. *Dogs* (under 55lbs.): 1st, T. G. Davey's Brighton Joe; 2d, Monocacy Valley Kennels' Springside Faust; 3d, A. Burlingame's Straightaway. Res., G. J Gould's Furlough Bang. *Bitches* (under 50lbs.): 1st, G W. Lovell's Cyrene; 2d, W. H. Vittum's Nellie Croxteth II.; 3d, G. J. Gould's Furlough Maud. Res., T. G. Davey's Brighton Lucy.—CHALLENGE—*Dogs* (Heavy-weight): 1st, Glenrock Kennels' Molton Banner.—(Light-weight): 1st, G. J. Gould's Ridgeview Comet. *Bitches* (Heavy weight): 1st, G. J. Gould's Josie Bracket.—(Light-weight): 1st, G. J. Gould's Lady Gay Spanker.—LOCAL—*Dogs:* 1st, H. B. Morgan's and C. A. Carlisle's Izzer Ranger. *Bitches:* 1st, C. C. Hess's Bessie Ranger; 2d, R. F. Van Dorn's Flirt Ranger.

ENGLISH SETTERS.—PUPPIES—*Dogs:* 1st, Miss F. Grey's Trouble; 2d, J. T. Williams's Noble Litt, Jr. Res., Mosiman Bros.'s Duke of Chicago. *Bitches:* 1st, Mrs. E J. Westcott's Lady Lucifer; 2d, Mosiman Bros.'s Queen of Chicago. Res., C. C. Daly's Queenie.—NOVICE—1st and 2d, W. B. Wells's Selkirk Iris and Selkirk Atilla. Res., Claremont Kennels' Paul Bo, Jr.—OPEN—*Dogs:* 1st, W. B. Wells's Selkirk Dan; 2d, P. T. Madison's Rodfield; 3d, E. A. Burdett's Cincinnatus Pride. Res., W. B. Wells's Selkirk Atilla. *Bitches:* 1st, 2d and 3d, W. B. Wells's Luna, Selkirk Iris and Selkirk Lit. Res., Claremont Kennels's Sousie.—CHALLENGE—*Dogs:* 1st, Real English Kennels' Cactus.—LOCAL—*Dogs:* 1st, Miss F. Grey's Trouble; 2d, L H. Worst's King Rea. Res., Dr. A. W. Cooper's Roos II. *Bitches:* 1st, E. A. Burdett's Abbotsford Marion; 2d, D. C. Coleman's Queen Mark.

IRISH SETTERS.—PUPPIES—*Dogs:* 1st, W. D. Blackburn's Chicago Grouse; 2d, Dr. T. L. Fenn's King Red. Res., J. R. Mullaly's Mardo, Jr. *Bitches:* 1st, W. H. Eakin's Blanche Finmore; 2d, F. S. Thomas's Bessie Thasmo.—OPEN *Dogs:* 1st, S. Colson's St. Elmo; 2d, R. F. Straine's Prince Elcho; 3d, A. Carmichael's Lord Elcho, Jr. Res., G. A. Le Bean's Pat G. *Bitches:* 1st, W. L Washington's Belle of Kildare; 2d, J. M. Bullock's Lady Rockwood; 3d, Claremont Kennels' Sally Gold. Res., W. H. Eakin's Blanche Finmore.—CHALLENGE—*Dogs:* 1st, Claremont Kennels' Chief Red Cloud. *Bitches:* 1st, W. H. Eakin's Bessie Finmore.—LOCAL—*Dogs:* 1st, J. J. Hennessy's Prince Elcho, Jr.; 2d, C. B. McKibbin's Bones *Bitches:* 1st, Dr. T. L. Fenn's Fanchette; 2d, J. S. Wall's Belle of Orange.

GORDON SETTERS.—PUPPIES—*Dogs:* 1st, W. O. Lindley's Maximo Gomez; 2d, J J. Budlong's Tom View. Res., Highland Kennels' Kent Junior. *Bitches:* 1st, W. O Lindley's Anita Requena; 2d, Highland Kennels' Lady M. Res., L. P. Higgins's Maggie.—OPEN—*Dogs:* 1st, J. R. Oughton's Dwight Grouse; 2d and 3d, Highland Kennels' Louis S. and Highland Boy. *Bitches:* 1st and 2d, Highland Kennels' Fly M. and Highland Beulah; 3d, J R. Oughton's Dwight Sarah. Res., J. Redfield's Mabel R.—CHALLENGE—*Dogs:* 1st, J. R. Oughton's Heather Lad. *Bitches:* 1st, Highland Kennels' Highland Yola.—LOCAL—*Dogs:* 1st, W. O. Lindley's Maximo Gomez. *Bitches:* 1st, W. O. Lindley's Anita Requena.

CHESAPEAKE BAY DOGS.—1st, H. McAllister's Bret; 2d, E. R. Pike's Beverly Jack.

BEAGLES.—*Puppies:* 1st, J. Lewis's Thornwood; 2d, Venlo Farm Kennels' Sova.—OPEN—*Dogs* (over 13in.): 1st, J. Lewis's Ringwood; 2d, J. L. Alabaster's Tony W. *Bitches* (over 13in.): 1st, Venlo Farm Kennels's Sova; 2d, Glenwood Beagle Kennels' Lady Glenwood; 3d, L. Steffen's Wild Rose. *Dogs* (13in. and under): 1st, J. Lewis's Thornwood; 2d, Weeks & Turner's Roving Mike. *Bitches* (13in. and under): 1st, Waldingfield Beagles' Marjory; 2d and 3d, G. D. Weldon's June Clover and June Leader.—CHALLENGE—*Dogs:* 1st, J. Lewis's Ringleader. *Bitches:* 1st, J. Lewis's Lonely; 2d, Guy D. Welton's Kitty Clover.

SPANIELS—FIELD.—CHALLENGE—*Dogs:* 1st, Dr. S. J. Bradbury's Drayton Warwick.—OPEN—*Dogs* (Black): 1st, Toon & Thomas's Endcliffe Bishop. *Bitches* (Black): 1st, Toon & Thomas's Endcliffe Myrtle. COCKERS—OPEN—*Dogs* (Black): 1st and 2d, C. Douglas's Premier and Havoc; 3d, C. G. King's Governor. Res., Western Japanning Co. Central Beagle Club.

SHARPSBURG, Pa., March 15.—*Editor Forest and Stream:* The Central Beagle Club will hold its quarterly meeting in the Exposition Building on March 25, at 8 P. M., in the office of W. E. Littell. It is hoped that all the members will attend. The judges are to be elected for the coming field trials, and other important matters will be presented to the club for action.

L. O. SEIDEL, Sec'y.

The Late Mr. Heywood-Lonsdale.

Mr. A. P. Heywood-Lonsdale, of Cloverly, near Whitechurch, England, died suddenly on Feb. 24. He was conspicuous in canine matters in England and elsewhere, field trials in particular gaining his stanch support. Twice he sent a string of setters and pointers to this country to compete in the field trials.

The *Field* (London) has the following to say of this late eminent sportsman:

"By the sudden death of Mr. Arthur Pemberton Heywood-Lonsdale hunting, shooting, and the amusements of country life generally have lost a consistent and liberal supporter. The deceased gentleman, who was born in 1835, early in life manifested a decided liking for athletic exercises and field sports, and when he went to Eton soon joined the 'Wet-bob' division, and, being exceptionally powerful, was selected as a candidate for the Eton eight at a rather earlier age than usual.

"Late in the 70s Mr. Heywood-Lonsdale succeeded to the Cloverley estate. A former Lord Kilmorey, who hated the sight of a hound, had, at enormous cost, surrounded Shavington Park with a high wall to keep out hounds and foxes. Scarcely had the wall been built than it occurred to Lord Kilmorey that he had been guilty of a rather foolish and slightly unsportsmanlike act, so he proposed to demolish his wall; but this the trustees would not allow. By the irony of fate the place passed into the hands of an M.F.H. The Shropshire Hunt has experienced several ups and downs. In fact, the Shropshire country has been divided and subdivided again and again. Formerly there were two packs, the North and South Shropshire, but the country was eventually united, and at a somewhat critical period in the hunt's history Mr. Heywood-Lonsdale agreed to become the late Lord Hill's successor, and he gladdened all hearts by announcing that he would hunt the north country at his own expense. In what had been the south country foxes had in many places led a somewhat precarious existence, but subsequently Mr. Heywood-Lonsdale, in the most gracious manner possible, offered to bear the cost of hunting the south country by Shrewsbury, if the covert owners would undertake to preserve foxes. In Col. Cotes and the late Mr. Bibby fox hunting had always found good friends, but in some parts foxes were not as plentiful as might have been wished. Still the deceased gentleman bore the whole cost, carrying on the hunt in the most liberal manner. Until the time of his death Alfred Thatcher was huntsman, and though toward the close of his career he was not a particularly bold rider, yet in kennel he was absolutely first-rate, and perhaps no pack in England were keener drawers than the Shropshire. The men were capitally mounted, it need not be said; and, in every particular, the hunt was, thanks to the master's liberality, carried on in first-rate style. As a mark of respect to the memory of the deceased, it has been determined that the hounds shall not hunt again this season."

Continental Field Trial Club.

THE annual meeting of the Continental Field Trial Club was held in Chicago in the week of the Chicago show. The President, Major J. M. Taylor, in the chair. A quorum was present. The minutes of the previous meeting were dispensed with. Fifteen names were presented and admitted to membership. A committee was appointed to print the by-laws.

The club will hold trials on chickens in the Northwest. Location, date and judges to be announced soon.

Trials on quail will be held in Mississippi—most probably at New Albany—in January, 1898, following the trials held by the United States Field Trials Club at West Point. The judges appointed for the quail trials are Messrs. N. Wallace, E. H. Osthaus and W. S. Bell.

The resignation of P. T. Madison was accepted.

The following officers were elected for the ensuing year: Major J. M. Taylor, President; W. S. Bell, Secretary-Treasurer. Directors: George Ewing, H. K. Deveraux, T. G. Davey, E. A. Burdette, C. A. Draper, R. H. Merrill, F. H. Perry and R. V. Fox.

POINTS AND FLUSHES.

The Baltimore Kennel Association, energetically up to date, has provided new classes for poodles: one for challenge bitches, one for novice dogs and bitches, and another for champion dogs and bitches. A challenge class has been provided for Boston terriers, challenge dogs and bitches, and another for novice dogs and bitches. For dachshunde, a class for challenge dogs and bitches has been added. A class has been added for American-bred Irish terriers, dogs and bitches. Numerous club trophies and specials have been added to the special prize list. The secretary reports that entries are coming in lively and that the club's prospects are very good.

Entry blanks for the Futurity Stakes (1898) of the National Beagle Club of America can be obtained of the secretary, Mr. George W. Rogers, 208 West Eighty-eighth street, New York.

Wheeling.

Communications for this department are requested. Anything on the bicycle in its relation to the sportsman is particularly desirable.

A BICYCLE RECONNOISSANCE.

AS A test of the practical utility of the bicycle for fast service over rough roads, the reconnoissance from Fort Omaha, made by Lieut. W. R. Abercrombie, of the regular army, last June, is of interest to all wheelmen. The following particulars are taken from the official report as published in the current issue of the *Army and Navy Journal:*

The route selected was from Omaha, Neb., to Chicago and return, a distance of 1,142 miles; and the reconnoissance was made in obedience to a special order from Col. J. C. Bates, post commander at Fort Omaha.

Lieut. Abercrombie selected as companions Serg. Geo. M. Schofield and Corp. Gustav Lindquist. These men were chosen as possessing pluck and endurance, though neither of them was a skilled wheelman, the ride being intended in a measure to test the possibilities of green men.

The three men went into training five weeks before the start, drilling every morning and riding every afternoon. They covered from twenty-five to seventy miles daily over a broken country and carrying full equipment. After each ride they were rubbed down with a mixture of equal parts alcohol and witch hazel, and the lieutenant took especial pains to see that their stomachs were kept in good condition, concerning which he remarks: "A man can ride with a disabled hand or foot, but when his stomach goes back on him his services are valueless as a courier."

By June 1 the party were in excellent condition. The method for carrying equipment and rations included the use of a canvas carrying case to fit into the diamond frame, and a wire frame attached to the handle bars on which to secure an extra coat or any other small, light parcel. The weight of the packed bicycles averaged 50lbs., which included blanket, half shelter tent, one change of underclothing, one revolver and rations, as well as one spare chain, two pedals, two tires, two tubes of cement, and a few bolts, distributed equally.

From May 20 to June 7 it rained nearly every day, so that when the time came for the start the roads were in the worst possible condition. Bridges were down and travel by ordinary methods was at a standstill. Nevertheless the first day out the reconnoissance party covered eighty-six miles. They left Fort Omaha on June 10 at 5:30 A.M. On reaching the valley of the Missouri they found the lowlands a vast lake of mud. Ordinarily a beautiful garden spot, the heavy spring rains had completely covered the young corn and grass with a layer of wash from the surrounding terrain. The distance across the valley is about nine miles. In describing the situation Lieut. Abercrombie says: "On inquiry we learned that there had been no travel across the bottom for two weeks, as some of the bridges were washed out; the mud was more than belly deep for horses, and there was no bottom for wagons. But on pushing forward we found the crust formed on the mud would hold up our broad pneumatic tires, with the exception of two places, where we cut brush and walked over in mud and water up to our knees."

Further along on their route they found three bridges gone in a short distance. With the aid of some farmers they felled trees and thus succeeded in crossing. For ten miles they encountered broken trees, which had been blown down on the road a few days before their arrival. In summing up for the day, the lieutenant says it would have been impossible for a horseman to have gone over the route which they traversed on their bicycles.

The following day rain interfered with their progress to such an extent that after riding forty-five miles on the road they were obliged to take to the railroad track. "This was a new experience to me," says the lieutenant; "I did not believe the machine would stand the constant shock of bouncing from one tie to the other, and when a trestle presented itself a new complication to dismount and walk meant to lose time, and to cool off and stiffen up. So these were ridden, although the vibration of the handle bars at times where the ties were a little more than the regulation distance apart was terrific. It was remarked by each member of the party that, had their opinion been asked as to whether a machine could be ridden loaded over such a road, they would have said positively no; and as I look back now upon the ride I can scarcely realize that such a delicate-looking machine as a bicycle could withstand such rough usage. But as there was but one route left open for us, we took it, and averaged over nine miles an hour."

Their last day's run was made on the 15th, from Clarence, Iowa, to Dixon, Ill., a distance of ninety-nine miles. As showing the stuff these riders were made of, it is worth noting that the last fourteen miles of this run were made in sixty-five minutes over hilly roads, and that the men finished in good condition.

On June 17 the reconnoissance party arrived at Major-Gen. W. Merritt's headquarters in Chicago at 11 o'clock A.M., having traveled a total of 588½ miles over rough and muddy roads in seven days, an average mileage of eighty-four per day. On the return trip the riders found the roads in better condition, and were able to cover ninety-three miles per day. The daily average for the entire journey of 1,142 miles was eighty-eight miles.

To appreciate this record it must be borne in mind that it was made with machines weighing 50lbs. apiece. The best previous time from Chicago to Omaha is given by the lieutenant as an average of fifty-eight miles per day.

"On arrival in Chicago, I found that the constant jar over the rough roads had about used up my forearms; and as we had made the trip in twenty hours less than the professional record, and in three days less time than it was expected, I rested until the 20th inst."

The lieutenant is of the opinion that there are only two conditions where a bicycle is valueless as a means of transportation to a trained rider, namely, in sand devoid of any vegetation, and in soft, unpacked snow. He advises that in packing the load be carried as near the ground as practicable, and recommends for a cooking outfit the aluminum field kit designed by Lieut. Preston, of the Ninth cavalry.

Finally he says that, as a result of four years' experience, he is satisfied that he can pick out a detachment of fifty men from the Second U. S. Infantry that can ride 1,000 miles in ten days over ordinary country roads, if properly trained and provided with proper rations, wheels and equipment.

Compare this with the average limit of endurance of seasoned cavalry, which is given as twenty-five miles per day (Upton's Cavalry Tactics, page 477), and it will be seen that the bicycle has given man an immense advantage for covering ground, which will prove of vital importance in case of war.

WHEELING NOTES.

The ability to ride a bicycle has a commercial valuation nowadays if it is coupled with the proprietorship of a wheel. The sign "Wanted, boys with bicycles" is not uncommon in New York.

Mayor Strong, Colonel Waring and General Collis, of the Public Works Department, have all agreed to do what they can to remedy the evil of the present method of sprinkling New York's streets. Magistrate Simms, the spokesman of a committee from the associated cycling clubs, which waited upon these officials, put the matter rather forcibly when he said that the streets having asphalt pavement were flooded morning, noon and night during the summer, with no discrimination or common sense, and kept continually in a slimy, slippery condition dangerous to the life and limb of all bicycle riders. It is perfectly possible to have an asphalt street in ridable condition without the dust flying, and equally feasible to leave a narrow strip unwatered for the benefit of wheelmen.

Yachting.

As the yachting journal of America, the FOREST AND STREAM *is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.*

Supplement to "Small Yachts."

THE six years that have elapsed since the last revision of "Small Yachts" by its author, the late C. P. Kunhardt, have wrought wonderful changes in yachting the world over. While the broad principles so clearly set forth by Mr. Kunhardt in the work which has proved by sad chance his only monument remain unchanged, their application under different influences and conditions has produced an entirely new fleet of yachts in all classes, small and large. As a fitting supplement to the original work, the Forest and Stream Publishing Co. has issued a new volume, uniform in size of pages and plates, and containing some 200 pages; the work of Mr. W. P. Stephens, the present Yachting Editor of the FOREST AND STREAM.

The new book contains the complete working drawings of some thirty-five yachts and sailing boats, from the modern 46-footer down to the sailing dinghy; all types, keel, fin-keel, semi-fin and centerboard, being represented.

In answer to the general demand for complete, accurate and specific technical information which is constantly made by yachtsmen, the plans have been made as complete as possible, so as to serve for working drawings even for the young amateur. The dimensions, elements, etc., are given in full, and whenever possible the history of the yacht, with her performance, alterations, etc., is also given.

Especial attention has been paid to all details of construction, the tables of scantling and the descriptions of methods of working being lengthy and elaborate, as a guide to those who desire to build their own craft.

Some of the more important modern types which are treated in detail are the knockabout, the small racer and cruiser of the Scarecrow and La Gloria type, designed by Mr. Stephens, both fin-keel and centerboard; the skipjack, the single-hander cruisers, several of Mr. Wicksteed's best designs being given, and the Cape Cod catboat in different stages of development. The original "Scarecrow" rig is also described in detail.

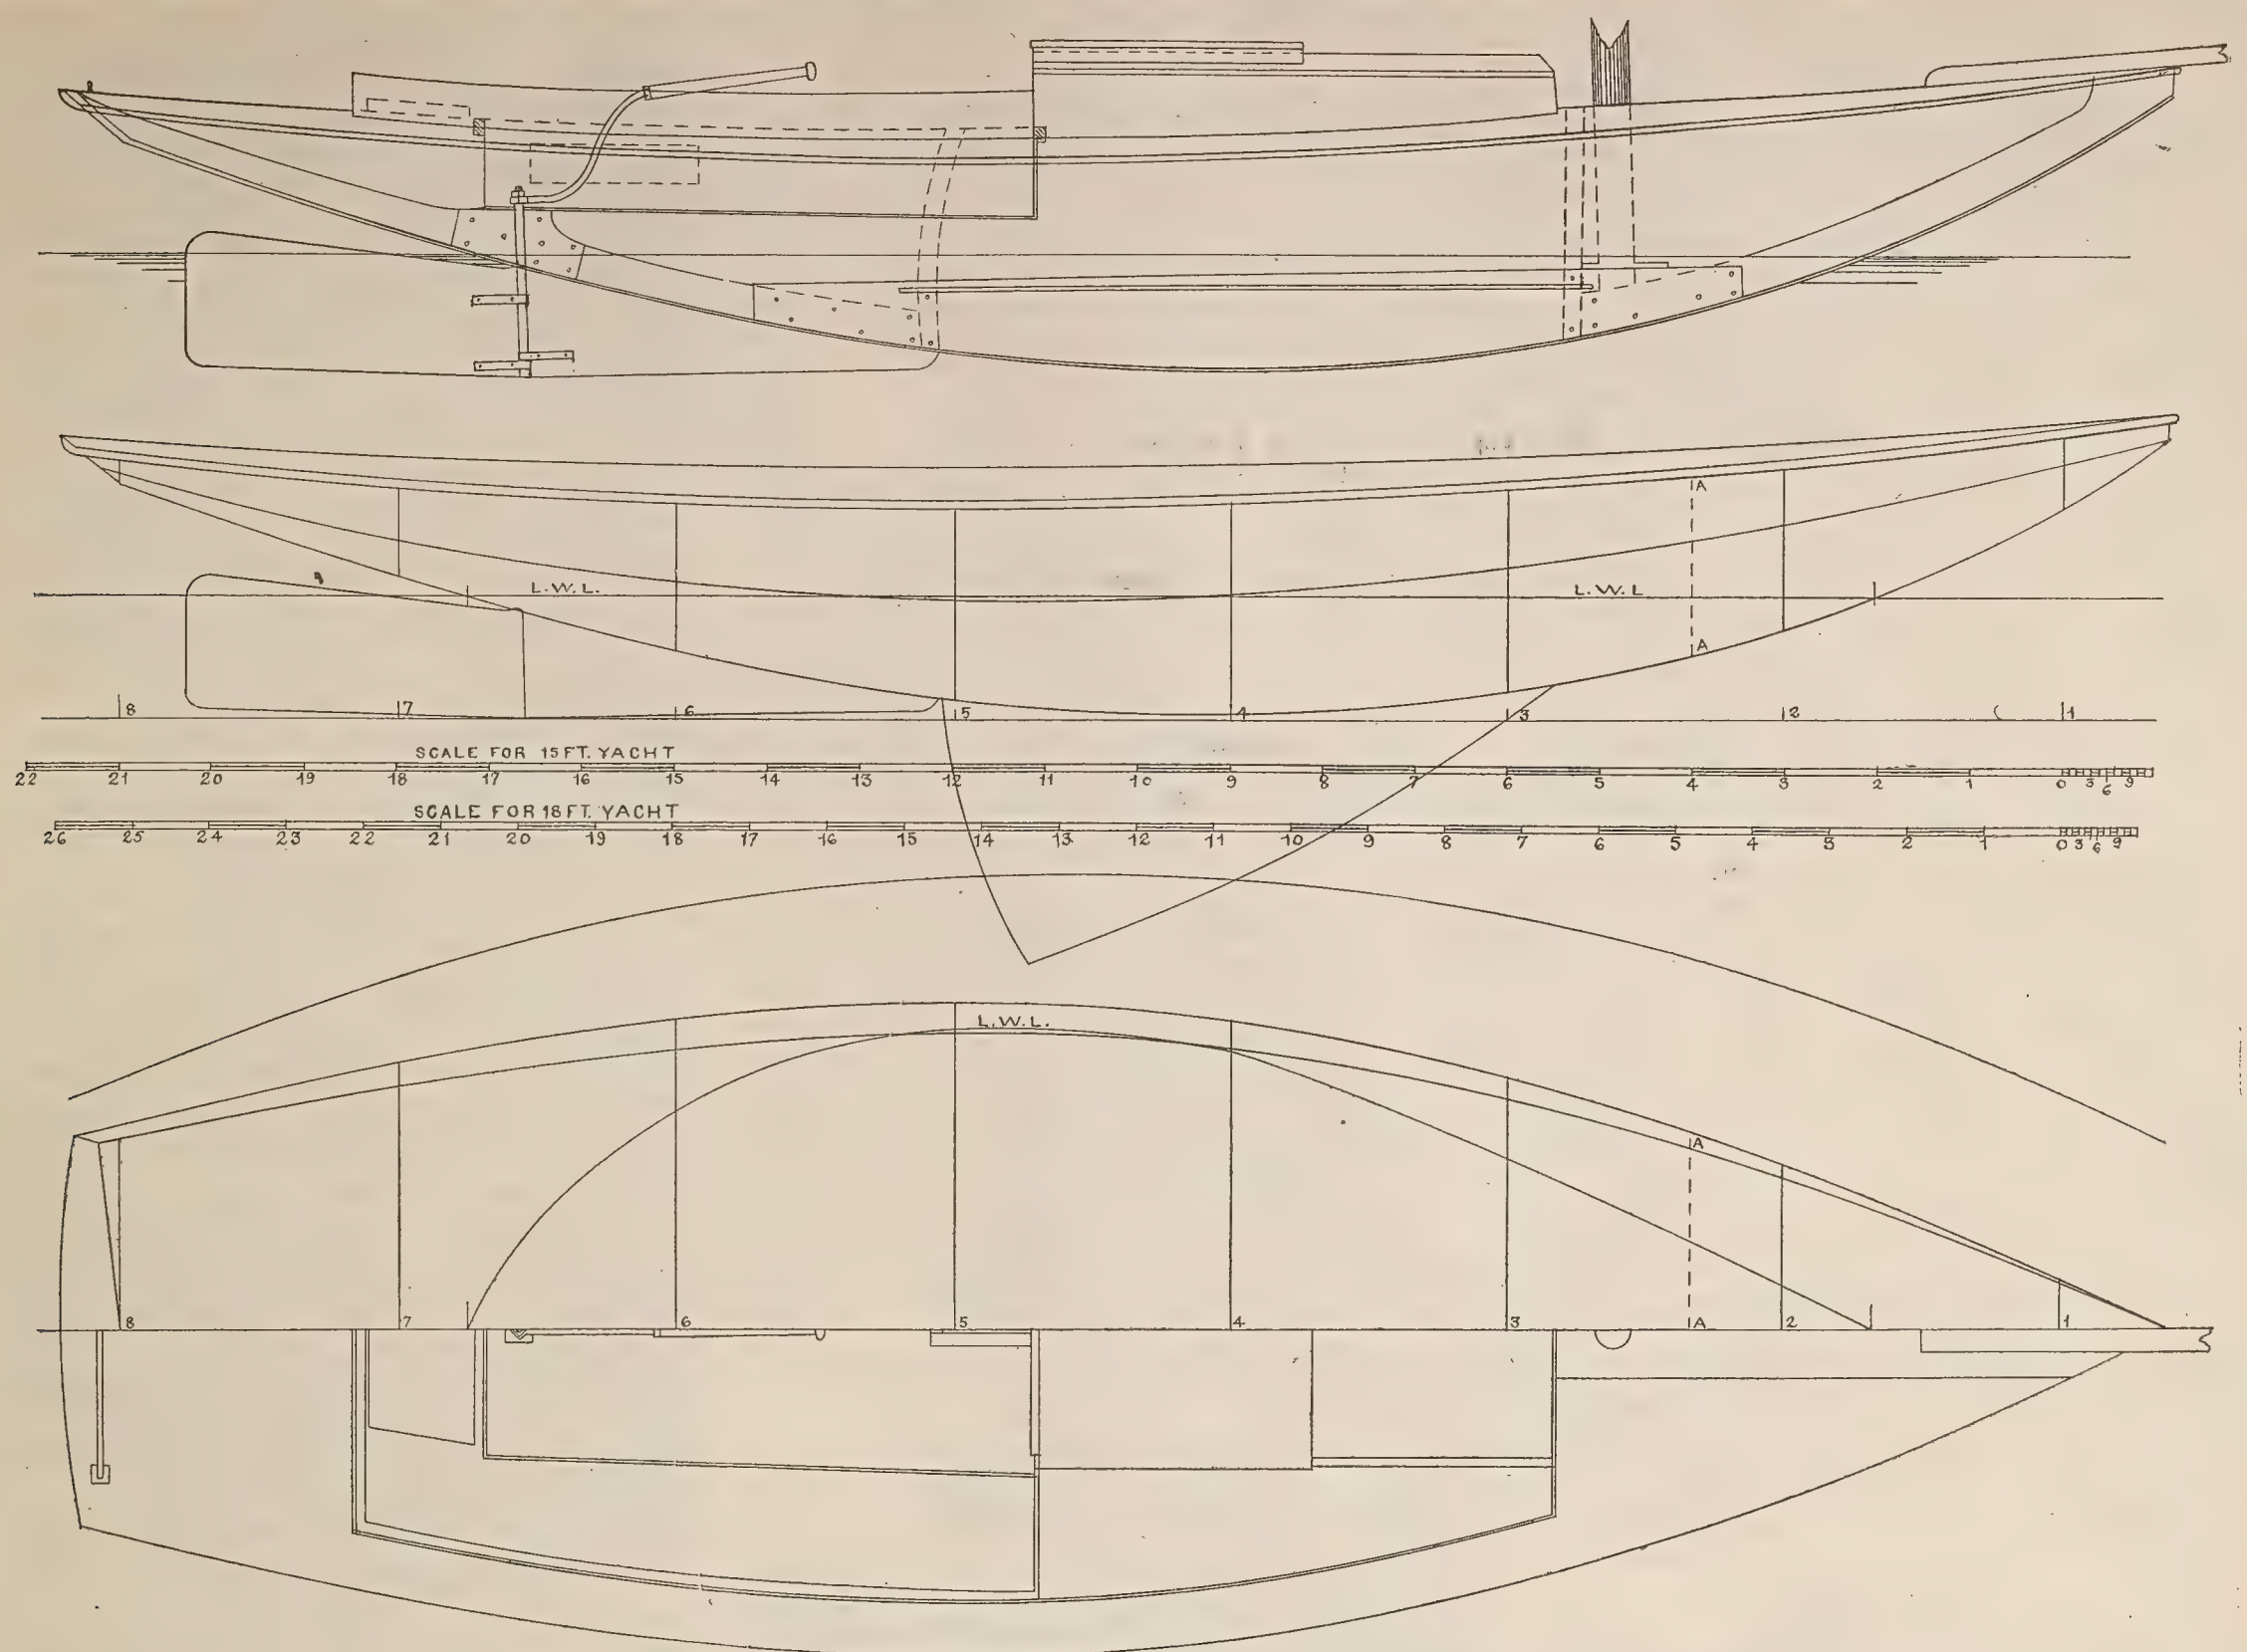
The book is prefaced by a very complete summary of the measurement rules now in use in this country and Great Britain, including the new linear rating rule, with directions for measuring both sails and waterline, and for marking the latter.

The governing idea throughout the work has been to make a complete and thoroughly practical guide for amateurs or for builders unfamiliar with modern models and methods; and from the large number of examples presented in its pages one can build almost any type of small craft that may be desired.

The Skipjack up to Date.

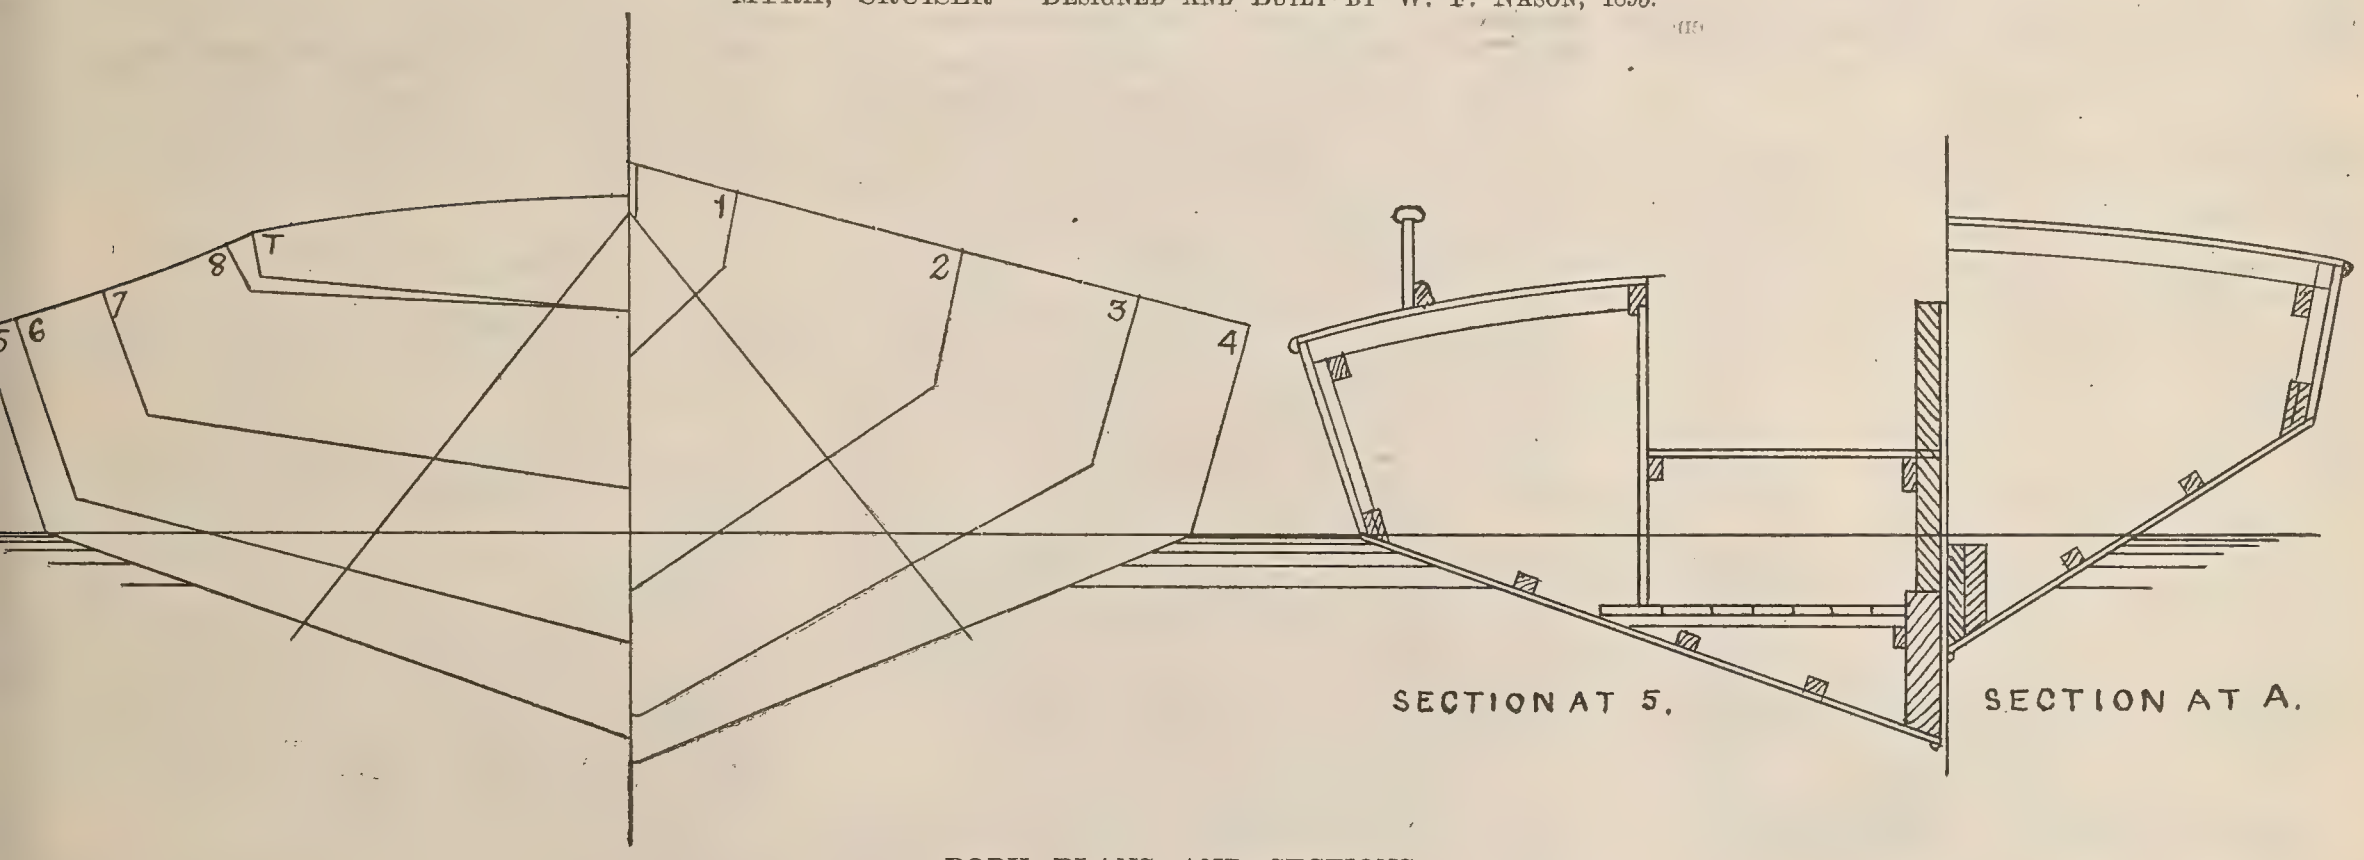
(Republished by request.)

THE modern *fin de siècle* flyer, such as so many sailormen now covet, is a most expensive luxury, in even the smallest sizes expressed by a fraction of a rating, and quite beyond the means of the average boat sailor. The little craft here illustrated has the merits of cheapness, easy construction, well within the powers of the amateur builder, and of fair speed and good performance; added to which she has a sheer plan that might easily be mistaken for something much more elaborate and expensive, and an up-to-date appearance that will commend her to many. She was designed and built by Mr. W. F. Nason, of Georgetown, Mass., who writes us as follows:



Editor Forest and Stream:

The inclosed plans show the Myra, a 15ft. cruiser, built by my brother and myself in the summer of 1893; her performance has been so satisfactory, and the construction is so simple and inexpensive, that a description may interest some of the readers of the FOREST AND STREAM. I have been a reader of your paper since 1883, and the many designs which have appeared in it have been a source of pleasure and information to me. "Canoe and Boat Building for Amateurs" taught me to build my first round-bottomed boat, and since then I have built several others, all of which have turned out well. The 15ft. Wizard, in particular, is a fast boat, winning the second class championship of the American Y. C., of Newburyport, for two seasons, and being first in her class in the Gloucester open regatta for two seasons.



Myra was not built for racing, but is faster than most of the working boats about Newburyport; she steers easily on and off the wind, and is easy in a chop. My expectation was that with such a bow she would pound in a chop; but she is quite as easy as other boats of her draft.

The construction will be understood from the drawings. The keel is formed of the bed pieces of the centerboard trunk, which extend 2ft. fore and aft of the head ledges; the stem and stern pieces being scarfed in between them. The bed pieces are 2×12in., the stem and stern 2×5, all of oak. Along the chine, where the sides and bottom meet, is a bilge stringer of hard pine, 2½×1¼in., into which are mortised the side timbers, 1×⅞in. The planking is of white pine, ⅝in., the bottom plank laid thwartships and stiffened by three strips of hard pine running fore and aft between the bilge and keel. The topsides run fore and aft in one width each. The deck and top of house are ½in. pine, canvased.

The cabin being small, necessarily the large amount of dunnage carried is stowed about the cockpit, a space on each side opening into cabin, a door in each side of the cockpit

MYRA, CRUISER—DESIGNED AND BUILT BY W. F. NASON, 1893.

BODY PLANS AND SECTIONS.

near the after end giving access to the space at the sides, while a deck hatch, inside of the coaming, leads to the space in the counter. Beneath the cockpit are two large drawers, which pull out into the cabin. The cockpit and companion are covered by a tent, and a party of five have been accommodated on the three days' trip, though three is the usual number.

The original intention was to carry from 300 to 400lbs. of ballast with a crew of three, but the boat has been sailed mainly without ballast. In this trim she is by the stern as compared with the design, but seems to sail better than when ballasted and trimmed just to the lines. With her closed cockpit and 21in. deck it is possible to heel her to a point where her speed is hindered, with no fear of a capsize As the design is quite capable of enlargement to 18ft. l.w.l., we give two scales for both 15ft. and 18ft. l.w.l., the respective dimensions being:

	15ft. l.w.l.	18ft. l.w.l.
Length, l.w.l.	15ft. 2in.	18ft. 2½in.
over all	22ft. 10in.	27ft. 4in.
Overhang, bow	3ft. 3in.	3ft. 10½in.
stern	4ft. 5in.	5ft. 3in.
Beam, extreme	7ft. ¾in.	8ft. 6in.
l.w.l.	6ft. 6in.	7ft. 10½in.
Draft, hull only	1ft. 4in.	1ft. 7in.
with board	4ft.	4ft. 10in.
Freeboard, least	1ft. ½in.	1ft. 3in.
Sheer, bow	11½in.	1ft. 2in.
stern	7in.	8in.
Mast, from fore end l.w.l.	2ft. 9in.	3ft. 4in.
deck to hounds	16ft. 6in.	19ft. 10in.
deck to truck	22ft.	26ft. 2in.
diameter at deck	5ft.	5½ft.
Bowsprit beyond end, l.w.l.	8ft. 6in.	10ft. 2in.
diameter	2¾in.	3½in.
Boom length	20ft. 6in.	24ft. 6in.
diameter	2½in.	2¾in.
Gaff, length	15ft.	19ft. 10in.
diameter—egg-shaped	2×3in.	2½×3½in.
Mainsail area, sq. ft.	315	455
Jib area, sq. ft.	73	104
Total	388	559

The cost of material was about seventy-five dollars; this includes rigging and cloth for sailing, my brother and myself doing all the work, including making the sails.

The sails are made of heavy drill, and have three battens of hard pine ⅞in. in diameter running through pockets at the rows of reef points. Without the battens, perhaps heavier cloth would be needed, say 6oz. duck.

The centerboard is of wood. A metal board would be better, perhaps; but would add to the cost.

The cabin gives good room for two persons to sleep in, one on each side of centerboard trunk. Four have slept there, and seven took refuge there during a thunder-shower. How they stowed themselves I do not know, for I was not there. The height is scant, hardly enough to sit upright on the floor under the companion slide. I think the house could be made 6in. higher at after end without hurting the sailing qualities much.

I had the top of the house arranged so that by unscrewing the bolts with which it was fastened it could be lifted up to give as much height as needed; but I never raised it, as with the tent over the cockpit I had room enough, and found no occasion to take the extra trouble. The cockpit is covered with canvas on sides and bottom, and painted, and is drained by holes into centerboard trunk. Some persons object to the bottom being planked athwartships, saying that it increases the resistance, and doubting the strength of such a construction; but I think the difference in resistance is but little, and as for strength I have sailed her in a strong wind with seven persons aboard and sailed with all the cloth she could lug with four men to windward, and I cannot see that she has been strained in the least. In sailing with other boats to windward I find that she can lay about half a point closer than most of them, and not forget to foot also; this I attribute to having rather more lateral surface for her size than most boats, and to the sails, which on account of the battens are very flat. The jib has a sprit from stay to clew like a Cape cat.

Small Calibers at the Sportsmen's Exposition.

THERE can be no question as to the ultimate success of the efforts of the tournament committee appointed by the Sportsmen's Association to carry out its plans for a rifle tournament at the Exposition now open.

The tournament opened at 3 P. M. on Saturday afternoon, March 13, and will continue until 9 P. M. on Saturday evening next, March 20. The bullseye target competitions will close on Friday night, in order that all targets may be figured up and premiums and prizes paid by the time the Exposition closes for good.

The ranges, which are in the basement on the Twenty-sixth street side of the Garden, are in charge of Messrs. Zettler Bros. and an able corps of assistants, while the official scorer, Mr. George W. Plaisted, handles the tickets and cash in a manner that can only be obtained by long familiarity with such tournaments. From the moment the competitions were declared open, the ranges, of which there are four, have been kept busy. Competitors also stood in line waiting their turns, so that the popularity of the affair cannot be gainsaid. The system of checking targets, entering scores, etc., is very complete. In fact, there is nothing to be improved, and nothing left undone that could have been accomplished by the committee in the brief time it has had at its disposal. The officials are:

Tournament Committee—H. D. Muller, Chairman; Edward Banks, Secretary; Gus Zimmerman, B. Walther, C. G. Zettler, G. W. Plaisted, R. Busse, R. W. Dewey, H. Mahlenbrock, William Dalton, C. Boag, A. Ludwig, D. Meersse, William Hayes, Ignatz Martin.

Referee Committee—Gus Zimmerman, Chairman; C. G. Zettler, H. Mahlenbrock, William Dalton, R Busse.

Official Scorer—G. W. Plaisted.

It is of course utterly impossible to give any idea of how the scores are running. In the individual match and in the continuous match the competition will be very keen indeed. The Zimmerman trophy is a popular contest also, and the actual winner will not be known until the last minute. The two trophies offered, the Schuetzen rifle by the W. R. A. Company, and the Zimmerman trophy by Gus Zimmerman, attract a lot of attention, and aid materially in spurring competitors on to fresh efforts.

The ranges are open from 3 to 11 P. M. each day of the week with the exception of Saturday night, March 20, noted above.

Rosenbaum's Good Shooting.

HAVING received the desired information as to the identity of our correspondent who had neglected to send us his name and address, always required to insure publication, we gladly give the following account of some good shooting done by Wm. Rosenbaum, a member of the Miller Rifle Club, of Hoboken, and also a member of the Hudson Rifle Club, of Marion, N. J. The account runs as follows:

"The shooting was done in practice at the Brendel Gallery, 52 Throop avenue, Brooklyn, N. Y. No sighting shoots were fired. The scores per string of 10 shots, off-hand, .22 short rifle, Zettler 25-ring target, were: 249, 245, 250 (full score), 247, 247, 247, 249, 248, 246, 244, a total for the 100 shots of 2,472 points out of a possible 2,500."

In shooting the above score we learn that Mr. Rosenbaum was using a Ballard rifle and W. R. A. Co.'s .22 short ammunition.

Trap-Shooting.

Leading dealers in sportsmen's supplies have advertised in our columns continuously for almost a quarter century.

If you want your shoot to be announced here send in notice like the following:

FIXTURES.

March 16-19.—BAYCHESTER, N. Y.—Second annual tournament of the Cobweb Gun Club; live birds and targets. Cobweb handicap at live birds, $500 guaranteed. Open to all. Nobody barred.

March 23-25.—NEW YORK.—Interstate Association's fifth annual Grand American Handicap (live birds), at Elkwood Park. $1,000 guaranteed in the main event, all surplus added. Entries close March 20 to John L. Lequin, Secretary-Treasurer Interstate Association, 44-48 Cedar street, New York city.

March 30.—BROOKLYN, N. Y.—All-day shoot of the Brooklyn Gun Club. Targets from a magautrap. Grounds located at terminus of Kings County Elevated in Brooklyn. Theo. Baron, Sec'y, 8 Murray street, New York.

April 7.—PORTLAND, Me.—Annual spring tournament of the Portland Gun Club. Harry A. Chisholm, Sec'y.

April 7.—HACKENSACK, N. J.—Third contest for the Recreation cup, under the auspices of the Bergen County Gun Club, Cup contest at 12 noon sharp. C. O. Gardner, Sec'y.

April 10.—WINDSOR LOCKS, Conn.—All-day tournament of the Windsor Locks Gun Club. Targets. C. F. Cleaveland, Sec'y.

April 14-16.—ATCHISON, Kan.—Airy Lou Hart's third manufacturers' amateur and fourteenth open-to-all tournament.

April 14-16.—BALTIMORE, Md.—Tournament of the Interstate Association, under the auspices of the Baltimore Shooting Association.

April 15.—YOUNGSTOWN, O.—First tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

April 15-17.—SAN ANTONIO, Tex.—Tournament of the San Antonio Gun Club. Open to amateurs only. Willard T. Simpson, Chairman Ex. Com.

April 16.—BRIDGEPORT, Conn.—All-day shoot of the Bridgepor Gun Club. Targets. V. A. Blakeslee, Sec'y.

April 17.—NUTLEY, N. J.—All-day shoot of the Yanticaw Gun Club. Targets from a magautrap. Shooting chmmences on arrival of 9:52 train from Chambers street, New York.

April 20-23.—LINCOLN, Neb.—Twenty-first annual tournament of the Nebraska State Sportsmen's Association. Added money later.

April 21-23.—SAN ANTONIO, Tex.—Second annual meeting and tournament of the Texas State Sportsmen's Association. O, C. Guessaz, Sec'y.

April 27-30.—FONDA, Ia.—Tournament under the management of Geo. E. Hughes and C. R. McCord. Live birds. $800 added money.

April 28-29.—RICHMOND, Va.—Tournament of the Interstate Association, under the auspices of the West End Gun Club.

April 28-29.—PERU, Ind.—Tournament under the management of J. L. Head.

May 5-7.—NEWBURGH, N. Y.—Annual spring tournament of the West Newburgh Gun and Rifle Association. First two days, targets; third day, live birds. $50 average money to three high guns in all programme target events. Open to all.

May 11-13.—PEEKSKILL, N. Y.—Annual tournament of the Peekskill Gun Club. First two days, targets; last day, live birds.

May 11-14.—WATERLOO, Ia.—Tournament of the Waterloo Gun Club. E. B. Walker, Sec'y.

May 12-13.—CONNERSVILLE, Ind.—Tournament of the Connersville Gun Club. Live birds. T. F. Thomas, Sec'y.

May 17-22.—KANSAS CITY, Mo.—Annual tournament of the Missouri State Game and Fish Protective Association. Fred T. Durrant, Sec'y.

May 18.—ALBANY, N. Y.—Annual spring tournament of the West End Gun Club. Horace B. Derby, Sec'y.

May 19-20.—SAVANNAH, Ga.—Tournament of the Interstate Association under the auspices of the Forest City Gun Club.

May 19-21.—CANTON, S. D.—South Dakota Sportsmen's Association annual. C. S. Seely, Sec'y.

May 20.—GREENVILLE, Pa.—Second tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

May 26-29.—EAST ST. LOUIS, Ill.—Annual tournament of the King's Smokeless Gun Club.

May 31.—CANAJOHARIE, N. Y.—Eastern New York Trap-Shooters League tournament, under the auspices of the Canajoharie Gun Club. Charles Weeks, Sec'y.

June 2-4.—SPRINGFIELD, O.—Annual tournament of the Ohio Trap-Shooters' League, under the auspices of the Springfield Gun Club.

June 8-9.— —— ——.—Tournament of the Trap-Shooters' League of Indiana.

June 8-11.—AUBURN, N. Y.—New York State Sportsmen's Association tournament. C. W. Tuttle, Sec'y.

June 9-10.—MONROE, La.—Tournament of the Interstate Association, under the auspices of the Monroe Gun Club.

June 10.—NEWCASTLE, Pa.—Third tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones. Sec'y.

June 15-18.—CLEVELAND, O.—Fourth annual tournament of the Chamberlin Cartridge and Target Company.

June 16-17.—FARGO, N. D.—Third annual tournament of the North Dakota Sportsmen's Association. Targets. W. W. Smith, Sec'y.

June 22-25.—OIL CITY, Pa.—Seventh annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Oil City Gun Club. Targets and live birds. Black powder barred. Special event: 25 live birds per man, $25, $1,000 guaranteed. Send entries to H. C. Reeser, Sec'y, Oil City, Pa.

July 14-15.—NEW HAVEN, Conn.—Tournament of the Interstate Association, under the auspices of the New Haven Gun Club. Wm. H. Hazel, Sec'y.

July 22.—MEADVILLE, Pa.—Fourth tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

Aug. 4-5.—LEWISTON, Me.—Tournament of the Interstate Association, under the auspices of the Androscoggin Gun Club.

Aug. 17-19.—TORONTO, Canada.—Tournament of the R. A. McCready Co., Ltd. Targets. $1,000. Open to all. Write for programmes.

Aug. 19.—WARREN, O.—Fifth tournament of the Pennsylvania and Ohio Border Gun League. Geo. H Jones, Sec'y.

Aug. 25-26.—MONTPELIER, Vt.—Tournament of the Interstate Association, under the auspices of the Montpelier Gun Club.

Sept. 15-16.—PORTSMOUTH, N. H.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club.

Oct. 6-8.—NEWBURGH, N. Y.—Annual fall tournament of the West Newburgh Gun and Rifle Association. First two days, targets; third day, live birds. $50 average money to three high guns in all programme target events. Open to all.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

It seems after all as if Jim Elliott and the Kansas City *Star* cup were going to be present at the "fistic carnival" at Carson City on St. Patrick's Day. Such an opinion is warranted by the following dispatch from Carson, dated March 12, that appeared in the morning papers of the 13th: "J. A. R. Elliott, of Kansas City, dropped in from the evening train with a small arsenal in his grip. He is enthusiastic over the trap-shooting tournament. Stuart to-day deposited the $1,000 purse in the Bullion Bank. The shoot will commence at 10 o'clock on Tuesday morning, March 16, and entries will close at noon. One thousand birds have been ordered by express from San Francisco, and there will be some sweepstakes shot off on Monday afternoon on the race track adjoining the big arena." We regret Jim's actions for two reasons: First, because we do not believe in making trap-shooting part of a "fistic carnival," alias prize fight; second, because his presence at Carson on the above date will preclude his attending the Grand American Handicap. Should he decide to attend the latter event, the greatest of its kind in this country, he could hardly be expected to do himself justice after the weariesomeness of a trip from Carson to this city.

The following invitation has been issued by Gus E. Greiff, captain of the Boiling Springs Gun Club, of Rutherford, N. J., to the captains of the clubs mentioned in the letter: "You are cordially invited to take part in a 3-men team shoot to be held on our grounds, Boiling Springs Gun Club, Rutherford, N. J., on April 10. Conditions of same are as follows: One team from each club only, $10 entrance, 50 targets per man, known traps, unknown angles. Money to be divided, four teams or more, two moneys; six teams or more, three moneys. If you will be a participant in this event please let me know. This shoot is open to the following clubs: New Utrecht G. C., Brooklyn G. C., Peekskill G. C., Newburgh Rod and G. C., Bergen County G. C., Endeavor G. C., Climax G. C., South Side G. C., New York Athletic Club, Blooming Grove Park Association, Passaic City G. C., Yanticaw G. C., Dunellen G. C. and Leonia G. C. Entries will close April 8. The team shoot will commence on the arrival of the 12 o'clock train from New York, Erie R. R., foot of Chambers street."

That was quite a team race last Thursday (March 11) on the Bergen County Gun Club's grounds at Hackensack, N. J., Van Dyke and J. Hildreth; Edwards and W. L. Cameron, and Tom Keller and B. Waters. In the pool sold before the race Edwards purchased Van Dyke and Hildreth for the large sum of 80 cents; Keller and Waters were sold as second choice to Frank Hyde for 70 cents; Edwards and Cameron went for 60 cents, and proved dear at the price. Keller's team won easily, thanks to the steady shooting of its rank and file, who outshot its captain both in style and total After the pool had been sold, Keller went to Hyde and told him that if he didn't let him have a half interest in the pool he'd "trun him down." In self-defense Hyde took Tom's 35 cents, and the two whacked up the profits. The high wind made the shooting very difficult, but Van Dyke was quite equal to the occasion. At the start in a practice sweep he ran 20 straight, and followed it up with 24 out of his first 25 in the team race, finishing with 90 out of his 100.

The Bridgeport (Conn.) Gun Club will hold an all-day shoot at targets on April 16. Mr. V. A. Blakeslee, secretary of the club, writes that the shoot will be open to all. The programme contains seven 10-target events and five 15-target events. The club will donate $15 to go to the four best averages in Events 3 to 10 inclusive, this schedule calling for just 100 targets to qualify for average money; $5 extra will be given to the shooter or shooters making 90 per cent. in the last eight events on the programme. Shooting commences at 9:30 A. M. The following are the directions as to reaching the grounds: "Take Stratford avenue trolley, Washington Bridge, Paradise Green or Avon Park car to the road on the east side of St. Michael's Cemetery; follow down, turning into the right at the first house on the right to the finest clay-bird grounds in New England."

The following item from the London *Field* of Feb. 27 will be of some interest: "Although paper has been put to a variety of strange uses, few people would be inclined to believe in its successful application as a material for gun barrels. Nevertheless it has been reported that this is now done, and that Herr Krupp has recently made several field guns of paper for the use of the German infantry. The great virtue of these paper cannons would seem to be their extreme portability, for they are stated to be so light that a man may carry one with ease. It will not seem to be matter for much surprise, therefore, if some experiment were now to be made in the direction of paper barrels for shotguns. While, doubtless, there would prove to be several objections to the use of paper for such purpose, it is conceivable that some advantages would, on the other hand, be derivable. Provided that absolute safety could be assured with them, there is still one objection to the employment of paper as a material for shotgun barrels which might prove to be well nigh insuperable, and that is, that by reason of their extreme lightness the recoil would be so much more severely felt as to become almost unbearable."

Mr. E. B. Walker, secretary of the Waterloo, Ia., Gun Club, sends us the following note of interest: "The Waterloo, Ia., Gun Club will give a four days' shoot, May 11–14. We have contracted for 3,000 live birds, and will run two sets of traps continuously, one for live birds and one for targets. We shall do our level best to make this one of the largest and best shoots ever held in the State. Our facilities cannot be excelled anywhere, as we have one of the finest shooting parks to be found, only five minutes' ride on electric cars from the heart of the city, with hotel and railroad accommodations second to none. We shall give two of these shoots annually and aim to make it pleasant for all who come. Our club is incorporated and composed of thorough gentlemen and sportsmen."

Last week we mentioned in Drivers and Twisters that Mr. E. S. Rice, the Western representative of the Du Pont and Hazard powder companies, was coming East to the Grand American Handicap with a strong team, consisting of a dozen able handlers of the shotgun in the West. The entry book for the Grand American Handicap now shows the following twelve names in accordance with the above: Grimm, Gilbert, Chan Powers, Dick Merrill, Eddie Bingham, Dr. Carver, Tom Marshall, Charlie Budd, Dr. Williamson, H. Dunnell, W. Dunnell and E. Vories. What an interesting feature of the week it would be to see a match shot between this team of twelve and a similar number from the Eastern States! Couldn't such a match be shot on March 26? It would create as much interest as the Grand American Handicap itself.

There's more fun to the square inch in the mutoscope exhibit in the Winchester Repeating Arms Co.'s stand at Madison Square Garden than in anything else in the whole sportsmen's Exposition. It's worth a great deal to look inside and see the wonderful reproduction of Rolla Heikes using a couple of Winchester repeating shotguns, and doing some quick work on bluerocks with Van Dyke as his assistant. We're not going to spoil sport by entering into details, but go and see it for yourselves, and don't take your eyes away until you see Rolla "fudge" when the magazine of his gun was empty and he didn't know it. Van didn't loaf at all either when one of the guns was empty.

The Brooklyn Gun Club, whose grounds are located at Enfield street and Liberty avenue, Brooklyn, N. Y., has decided to lease, and put in position at once, a magautrap. On March 30 it will celebrate the installment of the "bicycle trap" by holding an all-day shoot, the main feature on the day's programme being a 100-target event, handicap, of course, the entrance fee being $5, targets included. The addition of the magautrap to the equipment of the club makes it one of the most complete in this section. As this will be the first time a magautrap will have been used in the vicinity of New York city, it is safe to predict that there will be a good attendance to pay respects to it on its debut.

Dr. E. R. de Wolfe, captain of the Yanticaw Gun Club, of Nutley, N. J., writes us as follows under date of March 12: "The Yanticaw Gun Club, of Nutley, has just set up a magautrap on its grounds and will give a shoot at targets on Saturday, April 17. The main event will be a handicap at 50 targets, $3 entrance. We have the first magautrap in this locality, and we hope the shooters will come and see us and break a few targets over the new trap. Lunch will be furnished on the grounds. Shooting will commence on the arrival of the 9:52 A. M. train from Chambers street, New York."

Descriptions of shooting matches are bound to have a certain sameness about them. It is a hard matter to see wherein they can be made really interesting unless one is gifted peculiarly in the matter of similes. For an instance of the latter case take the New York *Sun's* report of the Edey-Mackay match: "Mackay made his first miss on his 4th bird, a driver with the speed of a gull, but made up for it by a sensational kill in the 5th round of a wonderful towerer which rose straight in the air as though blown out of a cannon!"

Mr. D. F. Harlan, secretary-treasurer of the Newcastle, Pa., Gun Club, writes, under date of March 9, as follows: "An election of officers of the Newcastle Gun Club was held on the evening of March 8, and resulted as follows: President, E. D. Reis; First Vice-President, W. L. Johnston; Second Vice-President, R. W. Cunningham; Secretary-Treasurer, D. F. Harlan; Captain, W. H. Hill. Directors: Dr. G. W. Greene, Charles Mathews and J. O. Sutherland."

The R. A. McCready Company, of Toronto, Can., informs us that it will hold a tournament on Aug. 17–19, and asks us to claim the above dates. The company writes: "We intend giving a large shoot at artificial birds exclusively. The amount to be $1,000, and open to all. We ask shooters to send us their names for catalogues." We have written the company to learn whether the "$1,000" is guaranteed or added, as there is quite a difference between the two conditions.

The Interstate Association has quite a large space reserved in Madison Square Garden for the accommodation of its manager, Elmer Shaner, and intending competitors in the Grand American Handicap. A large sign warns all shooters that entries cannot be received, without a penalty, any later than Saturday next, March 20. All handicaps will be awarded on March 22, and will appear in the morning papers of March 23. The list of entries is growing quite nicely.

The annual exhibition of sporting goods now on view in Madison Square Garden is worth a visit for anybody who can find time and money to spare. Outside of the articles on exhibition, it is more than worth the trip to meet old friends from all over the country, who keep dropping into the Garden. This exposition beats all its predecessors in every way.

What sort of a gun does Charlie Grimm shoot anyway? One of our cotemporaries says in its last week's issue that he is coming "to New York city, to be present and participate in the Grand American Handicap at Elkwood Park, where he expects to meet the crackerjacks with the shotgun of the entire country." "The shotgun of the entire country" should be a corker.

At the last club shoot of the Cleveland, O., Gun Club, held on March 4, only four members took part. G. E. W., none other than the son of Ralph "Redwing" Worthington, was high with 24 live birds out of 25, his 20th bird dropping dead out of bounds. Elliott scored 22, Latham 21, and Bodie 19.

With the Sportsmen's Exposition in full blast and with the Grand American Handicap at hand, it is hardly to be wondered that one runs up against champions at every street crossing on Broadway from the As or House to Twenty-third street.

Nate Astfalk is going to celebrate St. Patrick's Day, March 17, by holding a live-bird handicap, 25 birds, $10, birds extra, handicaps from 27 to 33yds. Astfalk's grounds are located a short way out of Elizabeth, N. J., at Oakwood Inn.

The Bergen County Gun Club announces that the regular monthly handicap shoot for the E. C. cup will be held on Saturday, March 27. The next shoot for the *Recreation* championship cup will be held on the same grounds on April 7.

It is hard to tell who is doing the most smiling just now: J. A. H. Dressel, John L. Lequin or Elmer E. Shaner. The entries for the G. A. H. are rolling up so fast that they've quit guessing "How many entries 'll we have?"

The Portland (Me.) Gun Club announces that it will hold its spring tournament on April 7. All events will be at targets, and the tournament will be managed by Mr. Harry A. Chisholm.

MARCH 16. EDWARD BANKS.

Acme Gun Club.

WASHINGTON, Pa., March 12.—Below are the scores made to-day by members of the Acme Gun Club, of this city, at the Prigg range. The day was very windy, making the targets hard to hit. Scores:

Events:	1	2	3	4	5	6	7	8	9	10

IN NEW JERSEY.

BOILING SPRINGS GUN CLUB.

March 6.—To-day was the regular club shoot of the Boiling Springs Gun Club. The cup was won by Dr. De Wolf with a score of 47 out of 55, the Doctor receiving a handicap allowance of 5 extra targets to shoot at. Several sweeps were also shot during the afternoon, all events being at unknown angles. The scores in these events were (Note—The detailed scores of the cup shoot appeared in our issue of March 13.—ED.):

Events:	1	2	3	4	5	6	7	Events:	1	2	3	4	5	6	7

MARCH 4 AT YARDVILLE.

March 4.—The announcement that Charlie Zwirlein would give a live-bird shoot to-day at Yardville drew a crowd of shooters and spectators to his grounds. Twelve entries were obtained in the Inaugural Handicap, a really good list when the number of other attractions scheduled for to-day is considered. The quality was unapproachable, some of "the best in the land" were there. The birds too were as good as any that Zwirlein has ever trapped. A glance at the scores in the 20-bird event will tell what sort of birds they were. Miss Annie Oakley was one of the entries, and she had the honor of being the only straight at the end of the 8th round. Welch was the winner of first money ($50) with 18 out of 20; Brewer and Class divided second ($36) on 17 each; Houston took third ($24) with 16.

Events 1 and 2 were $2 miss-and outs for the sake of a little practice. These resulted thus:

No. 1: Welch and Kleintz 6, Cubberly 5, Zwirlein 3, Rothacker 2

No. 2: Welch and Kleintz 3, Rothacker and Zwirlein 2, Cubberly 1.

The Inaugural Handicap is given in detail below, and also the scores made in Nos. 3, 4 and 5. No. 3 was a $2 miss-and-out; No. 4 was at 5 birds, $5; No. 5 was a $5 miss-and out. Scores in these events follow:

Inauguration Handicap, 20 birds, $15.	No. 3.	No. 4.	No. 5.
R A Welch (30)	12112	12012—4	2120

TEAM RACE AT HACKENSACK.

March 11.—Some little talk on Tuesday morning, March 9, resulted in a very pleasant afternoon's sport to day on the grounds of the Bergen County Gun Club, at Hackensack. To make a long story extremely short, Ferd Van Dyke and J. Hildreth, both of the Winchester Repeating Arms Company (the latter being one of the company's Southern salesmen), constituted one team; F. S. Edwards and W. L. Cameron (the latter one of the W. R. A. Company's representatives in Canada) made another team; and Tom Keller (with Peters's cartridges and King's Smokeless) aided by B. Waters (a gentleman who styles himself a "novice") made up the third team. The conditions were: 100 targets per man, unknown angles, lowest team to pay for the targets.

It was a lovely day, but there was a strong wind blowing that spoiled many a good calculation. Targets dipped and scooted just when they should have gone straight, and that caused a lot of trouble. If any race ever caused more genuine fun, we have yet to hear of it. The result of it all was that Keller and Waters (the order should more properly be reversed) walked off with first honors, leaving the other teams far in the rear. No records were broken, at least none to boast about. The following scores tell the tale:

Keller's Team.

B Waters.....1111100101101111000110111111101111111111111000101—37

EDWARD BANKS.

CLIMAX GUN CLUB.

March 10.—The regular club shoot of the Climax Gun Club was held this afternoon at the club's grounds near Fanwood. Scores ruled high, the totals made by the first squad (Van Dyke, Keller, Goodman and Singer) being pretty nearly a record. Out of the 100 targets shot at by this team of four, prior to the shooting of the allowances, the team scored 94 at unknown angles. The scores in detail were as below:

F Van Dyke (25).....1111111111111111111111111 —25
T H Keller (25).....1111101111111111111111111 —24

AT ELKWOOD PARK.

March 9.—Nine events were shot off to-day at Elkwood Park. All were $5 miss-and-outs with the exception of Nos. 4 and 8. No. 4 was the preliminary handicap, 25 birds, $10, three high guns; No. 8 was 10, $7, two high guns. The tie in No. 5 was shot off in No. 6, and the tie in No. 7 was shot off in No. 8.

Some big scores were put up to-day: Smith ran 36 straight before missing a bird, and made a total of 56 out of 60 shot at during the day. Wilson scored 63 out of 68 shot at; Daly, 60 out of 66; Capt. Money, 57 out of 63. The large totals rolled up by Smith and Wilson would not excite so much astonishment were we at liberty to give the voting names of those two shooters.

The events in detail were as below:

No. 4, preliminary handicap, 25 birds, $10:

	No. 1.	No. 2.	No. 3.
Smith (28)	2222211122122112122222112220—24	(28).2222	(28½).212	(29).22212

The Art of Scoring.

THE art of scoring! It may sound strange to some people to hear scoring spoken of as an art; but such it is nevertheless. Accurate scoring under the pressure of the rapid-fire system—particularly with a squad that goes through its work without delay—is a rarity rather than the rule.

Ideal scorers are born; others are made. Some men are naturally accurate and quick in their thinking qualities; others need training. The former are "born scorers;" they are the men who can take squad pad after squad pad, fill them out with 1s and 0s, return them to the cashier's office and never have a kick registered against their work. A club that has a man of this class has a treasure indeed. We always like to go to a tournament given by a club that announces in its list of officials an "official scorer." We know then that the club numbers among its members one who is known to be accurate in his scoring; his capacity for such accuracy has been deemed worthy of official recognition.

A MOST IMPORTANT POSITION.

Nothing makes or mars a tournament more readily than good or bad scoring. Everything else may be "all lovely;" the lunch good, sky bright, weather warm and dry, entries large, etc.; but if the scoring is bad, the club gets a black eye and its tournaments are looked askance at in the future. A man likes to get what he breaks, and as a rule he deserves every target from which a "perceptible piece" has been broken. It is seldom that one hears of it when what should have been a 0 has been changed into a figure 1; but one always learns when "they've given me a miss when I broke it all to pieces!" For this reason the position of scorer is one of the most important in the list of officials for a club shoot or a tournament.

The position, however, is one that should not be so hard to fill. The usual feeling unfortunately is that "Anybody'll do for scorer." We wish to impress upon club secretaries and upon the management of tournaments that "anybody" won't do. A good scorer is quite as necessary to the success of a tournament as a good referee. Where a blackboard score is kept, an accurate man for the "manifold pad" is not so necessary as when no blackboard is used, for the simple reason that "the blackboard goes," the manifold pad being checked up to correspond with the scores as shown on the board.

BLACKBOARDS SHOULD BE USED

whenever practicable. In our article on "Programmes and Tournaments," which appeared in FOREST AND STREAM of Oct. 24, 1896, we wrote: "Shooters can see their scores being chalked up on the blackboards, while no one except the manifold man himself knows what he is doing to the scores; he may be one or two men behind, and no one any the wiser." The additional cost of a blackboard man for a tournament is nothing when compared with the additional satisfaction secured to the shooters. The blackboard too should, wherever practicable, be placed to the left of No. 1 score, and at right angles to the line of the score. This enables every shooter to see the figures at any time without bothering the next shooter, and he is also able to scan the 1s and 0s as he walks up the line from No. 5 to No. 1. The season for tournaments is almost upon us, and we need, therefore, no excuse for placing this matter once more before the readers of our trap columns.

AS A HINT TO SCORERS

we would suggest that it is impossible to pay attention to two things at the same time, and do both satisfactorily and accurately. Scorers should always remember that it is the *referee's* business to look at the targets and decide whether they are broken or lost; it is the *scorer's* business to keep his eye on the score sheet, and register on it the decisions of the referee. An occasional glance from the sheet to the line of shooters will quickly inform him whether he is right as to which man's turn it is to shoot. He has nothing to do with watching the targets. Show us a scorer who, when a squad is at work, keeps lifting his eyes from the score sheet to watch the targets, and we will show you a man who will sooner or later hear a strenuous and perfectly justified kick against the figures as shown on that sheet.

Scorers should be placed where it is perfectly possible to see the shooters when at their respective positions, as it is sometimes necessary for him to check himself by finding out if the man whose turn it is to shoot is the man to whom the result of that shot would be scored. When a blackboard is kept, the manifold man may be placed with his back to the shooters, but should always be able to see that he and the blackboard man are "together."

If the above suggestions and hints accomplish anything in the line of better scoring at club shoots and tournaments, every inch of space devoted to the subject in these columns will have been well worth the time spent in writing and the money expended in the cost of typesetting.

Vagaries of the Old Percentage System.

A CURIOUS COINCIDENCE AT UTICA.

A FEW days ago we received the following letter from John W. Fulford, of Utica, N. Y., relating a curious coincidence that occurred in the division of moneys under the old system in a 10-target event:

"UTICA, N. Y., March 8.—*Editor Forest and Stream:* I inclose you the scores made in a 10-bird event shot here on Saturday last in which there occurred something I never saw nor heard of before. There were twelve entries at 50 cents each, targets taken out of purse at 2 cents each, four moneys, 40, 30, 20 and 10 per cent. Four men broke 9 and divided $1.44, that is, each man drew 36 cents; three men broke 8 and each got one-third of $1.08, that is, 36 cents each; two men broke 6 and divided 72 cents, or 36 cents each; one broke 5 and drew 36 cents. Thus out of the twelve entries there were ten in for money and each drew 36 cents."

The scores referred to were: M. Mayhew, Cole, Barker and Corbett, 9; Borland, E. D. Fulford and Tunnicliffe, 8; Wirt and Nought, 6; Jevons 5, Carey 4, Peckham 3.

While we have never seen an exactly similar occurrence, we have had our attention called more than once to cases that are on all fours with the above. One case happened quite recently. It was also a 10-target event, three moneys, 50, 30 and 20 per cent. There were five 9s, three 8s and two 7s, hence each man drew the same proportion out of the purse. The question that naturally arises when discussing such cases is this:

HOW CAN SUCH A SYSTEM BE DEFENDED?

How can any system of dividing awards for skill, supposedly according to merit, be defended when that system permits of a 50 per cent. man receiving the same reward for his work that a 90 per cent. man gets, as was the case in the sweep at Utica? We recall an instance where at Memphis last May there were about seventy entries in a 25-target event; out of the seventy odd entries about twenty-two broke 22 and each got about $1.25 for the $3 entrance; 21s were scarce and each man in that hole got a fair return for his money. The "upper classes" were all right, and it was the hope of getting into the upper classes that kept the boys shooting. It may be that for such tournaments as the Memphis, the E. C., Knoxville, Du Pont and Hazard tournaments of past years, the old percentage system may be more popular on account of the "chances." We never have liked the old system, and we have yet to see *on paper* and *in cold type* any positive and plausible defense of its workings. Won't somebody come forward and oblige us? We will guarantee him all the space in our trap columns that he can fill, even if we have to present his story in serial form.

IT IS DIFFERENT WITH THE ROSE SYSTEM.

With the Rose system it is a totally different thing. The system, while it always rewards skill proportionately, does not permit of "large pots alone;" does not permit of large winnings; for all practical purposes it does away with dropping for place and the evils incident to pooling of interests. There is much that can be said in defense of this system. Much has been said in the columns of FOREST AND STREAM on behalf of the system, and every word has told. The result is patent to all. Programmes are constantly coming to hand with the announcement that the Rose system will be used in dividing purses. For the first two months of 1896 we could have counted such programmes on the fingers of one hand, and not have needed every digit at that. Both hands are not sufficient this year.

There must be some solid reason for this great growth in popularity. There is also a reason why the system is not popular with some people. Neither of these two reasons is hard to guess if you'll only think a moment or two after reading the above.

ON LONG ISLAND.

ERIE GUN CLUB.

March 10.—The Erie Gun Club, of Brooklyn, had a good turnout of members at its monthly live bird shoot held this afternoon at Dexter Park. The club event is at 7 live birds per man, and only two shooters, Fred. Gref and Charles Plate, were able to kill straight. The scores were:

Class AA, 28yds.: Charles Plate 7, Henry Dohrmann 6, John Plate 6, M. J Elsasser 5.

Class A, 28yds.: Charles Runge 6, Henry Mueller 4, John Schmadeke 3, Harry Jankowsky 2.

Class B, 27yds.: Fred. Gref 7, George Fuchs 6, William Roberts 5, Jacob C. Schmidt 4, C. H. Luhrssen 4.

Class C, 26yds.: John H. Plate 6, Henry Degenhardt 2.

The second event was a sweep at 3 birds per man, all 28yds., class shooting, ties miss-and-out: C. Plate, F. Gref, G. Fuchs and J. H. Plate, 3; Dohrmann, Runge, John Plate, Elsasser, Schmidt and Schmadeke, 2; Robert 1, Jankowsky 0.

Miss-and-out for first money: Charles Plate, 1; Gref, Fuchs and J. H. Plate, 0.

Miss-and-out for second money: Dohrmann, John Plate and Schmadeke, 3; Runge, Schmidt and Elsasser 0.

PARKWAY ROD AND GUN CLUB.

March 10.—Seven members of the Parkway Rod and Gun Club took part this afternoon in the club's monthly live-bird shoot near the Old Mill, Jamaica Bay. John Wye (26yds.) was the only straight 7 in the club event. Scores:

Club shoot, 7 live birds, handicap rise: John Wye (26) 7, James Bennett (30) 6, Henry Bramwell (30) 6, D. S. Van Wicklen (26) 5, H. J. Selover (26) 5, G. Torborg (26) 5, George Wenzel (28) 4.

Other events were shot as below, John Wye and James Bennett doing the best shooting:

No. 1, 3 birds: James Bennett 3, John Wye 3, Henry Bramwell 2, Henry J. Selover 2, David S. Van Wicklen 2, George Wenzel 1.

No. 2, same: John Wye 3, James Bennett 2, Henry Selover 2, David S. Van Wicklen 1, George Torborg 1, Henry Bramwell 0, George Wenzel 0.

No. 3, same: John Wye 3, James Bennett 3, David S. Van Wicklen 3, Henry J. Selover 2, Henry Bramwell 2.

UNKNOWN GUN CLUB.

March 11.—There was a large attendance this afternoon at Dexter Park, the occasion being the regular monthly club shoot of the Unknown Gun Club. There were 19 entries in the main event, the club shoot at 7 live birds each. Of the 19 not one scored a straight; 5 tied for first money on 6 each and divided; 10 scored 5 each and shot off miss-and-out, Kneble, McGuinness and Sweeney dividing at the end of the 1st round. After the club race ex-Judge James B. Voorhees and E. A. Vroome shot off their tie for the yearly medal donated for last year's contests. The conditions of the shoot-off were 3 birds each, then miss-and-out. Vroome won by scoring his 3 birds, his opponent losing 1 of his 3. Scores were:

J. B. Voorhees (29) 6, Dr. Moore (25) 6, Wm. Sands (26) 6, J. Akhurst (25) 6, H. Boemermann (25) 6, E. A. Vroome (29) 5, J. F. Knebel (28) 5, G. Selig (25) 5, Dr. Schwartz (29) 5, M. Brown (28) 5, L. Loue (26) 5, P. J Sweeney (26) 5, P. May (25) 5, J. O'Hara (25) 5, J. Henry (25) 5, H. Knebel, Sr., (26) 4, R. Smith (25) 4, E. Hauff (24) 3, H. von Staden (23) 3

NEW UTRECHT GUN CLUB.

March 13.—The semi-monthly target shoot of the New Utrecht Gun Club was held this afternoon on the Dyker Meadow grounds. The members took part in the club shoot, F. A. Thompson winning the shoot in Class A, and Dr. O'Brien being easily winner in Class B. The high wind that swept across the traps made the shooting hard, and good scores therefore almost an impossibility. Scores were:

Club shoot, 25 targets, unknown angles, handicap allowances:

Class A.

F A Thompson (0)	1111111011101111001111110 —20
M Van Brunt (0)	1111011111001011100111011 —18
J Gaughen (0)	0111101111001111101011001 —17
W H Thompson (0)	1101101101101100111100111 —17
J A Bennett (2)	1101100110111010110100011110—16
P E George (2)	1001100100101010111100010001—13
Platt Adams (0)	1100010100101010010011011 —13

Class B.

Dr O'Brien (0)	1111011101101100111111011 —19
C C Fleet (2)	1110011101010100010101101 —15
Dr Shepard (1)	0110100011010010101010110001 —12

Other sweeps were shot as below, all 10-target events and all at unknown angles:

Events:	1	2	3	4	5	6	7	8	Events:	1	2	3	4	5	6	7	8
F A Thompson	10	7	5	4	6	4	4	7	DrShepard	..	4	6	5	4	6	..	7
Adams	8	8	8	6	7	5	7	5	P George	..	..	..	1	5	5	4	6
Gaughen	7	7	7	9	7	9	9	4	W H Thompson	..	..	..	7	8	7	10	7
Van Brunt	..	8	8	4	7	7	9	7	Dr O'Brien	..	..	..	8	7	8	8	8
J Bennett	..	4	8	8	6	9	9	..									

No. 9 was the same conditions and resulted thus: Bennett, Gaughen and W. H. Thompson 8, Adams, O'Brien and F. A. Thompson 7, Fleet 2.

CRESCENT ATHLETIC CLUB, OF BROOKLYN.

March 13.—A team representing the Crescent Athletic Club, of Brooklyn, shot a race to-day with the Columbia College team at the Williamsbridge oval. The Crescents won by 83 to 70. In the absence of the regular members of the team, shooting at the Bay Ridge grounds of the club was only desultory. The following scores were made, all events being at 25 targets:

Events:	1	2	3	4	5	Events:	1	2	3	4	5
W P Pickett	15	18	13	17	19	E F Wendelstadt	..	6	10	..	..
L C Hopkins	8	8	9	12	16						

INDIANS AT DEXTER PARK.

March 13.—The Indian Gun Club held its regular live-bird shoot at Dexter Park this afternoon. Ten members took part in the team race, the sides being captained by George Long and Frank Buckman. Long's team won by 5 birds, each man shooting at 10 birds. Scores were:

Team race, 5-men teams, 10 live birds per man, 28yds. rise all:

Long's Team.		Buckman's Team.	
Jas Smith	2111110111—9	J Chasmer	1211111220—9

Androscoggin Gun Club.

LEWISTON, Me., March 11.—The contest for the Doten challenge cup took place to-day on the grounds of the Androscoggin Gun Club. Mr. Hunnewell, the holder, was second in this match; G. W. Cobb winning with 25 straight. Mr. Hunnewell won it at the last shoot with a similar score of 25. Fifteen members took part in to-day's contest, which was held with a high wind blowing and with deep snow on the ground. Scores were:

G R Hunnewell	1111111101011111111111111—23
G W Cobb	1111111111111111111111111—25

SEC'Y.

Pawtuxet Gun Club.

PAWTUXET, R. I., March 6.—In a practice shoot to-day by members of the Pawtuxet Gun Club two events of interest were decided. The first was the match given below between R. C. Root and W. H. Sheldon. The second was a bit of practice work by Mr. Root, who shot at 50 singles and 29 pairs. His score of 44 out of 58 in pairs must be classed as excellent work when it is considered that he is actually only a beginner at trap-shooting. Scores were:

Match: Unknown traps and unknown angles, 25 targets per man, use of both barrels, Sheldon at 21yds., Root at 16yds.

Sheldon	1220111112011111101022111—20
Root	1012101210100221100211101—17

In practice Root shot at 50 singles and 29 pairs with the following result:

Singles	11101110111001000111110110011101110111000111000111—32
Pairs	11 01 00 01 11 11 11 11 11 10 11 10 11 11 10 10 10 00 11 11 01 11 11 11 11 11 00 11 11 —44

W. H. SHELDON, Sec'y.

New Haven Gun Club.

NEW HAVEN, Conn., March 10.—Inclosed please find scores of our regular monthly shoot for March. The members turned out well, twenty taking part in the team race. J. B. Savage and M. H. Clark were chosen captains, and each selected a man in turn, Savage having the first choice. As it happened, the teams were very evenly divided, Savage winning by the close margin of one break.

In the 30-bird handicap race Callahan and Stevenson tied for first, Bement, Potter and Kelly for second, while Savage took third all alone.

Judge Callahan shot exceptionally good, breaking 27 out of 30, and going 20 straight in the team race.

A number of extras were shot for practice both before and after the main events, in which Potter, Stevenson, Whitney and Cowee did good work.

Over 2,000 targets were thrown, which is pretty fair for an afternoon shoot.

Team shoot, 20 targets, known:

Savage's Team.		Clark's Team.	
Callahan	11111111111111111111—20	Whitney	11011111111111111111—19

In the above match D. L. Atkins was official scorer and C. Dart rap-puller.

Six events at targets were also shot, fifteen men taking part in the events. Among the out-of-town visitors were: Shepardson, from Poolville, N. Y.; Case and Brooks, of Norwich, N. Y. The scores given below might have been better, but the wind blew hard from the south right across the traps, making the shooting hard for new men at the trap. Scores follow:

Trap Around Pittsburg.

EAST PITTSBURG GUN CLUB.

PITTSBURG, Pa., Feb. 27.—Below are the scores made to-day by members of the East Pittsburg Gun Club in the regular monthly shoot for the E. C cup. Eight men took part in the shoot, which is a handicap affair, 100 targets per man, unknown angles, allowance of extra targets to shoot at. Ferguson, with an allowance of 10 extras, shot steadily, scoring 42 out of each 50, and 7 out of his 10 extras, winning the cup with plenty of room to spare. His nearest antagonist was Uncle John, who scored 82 from scratch. The weather was clear and bright. Scores in detail follow:

Sharrard (0)	11110001010111101101101110110110001011111111111111	—36

SWENSON, Sec'y.

Trap Around Buffalo.

BISON GUN CLUB.

BUFFALO, N. Y., March 4.—The Bison Gun Club held a shoot to-day on the Walden avenue grounds. Some good scores were made, Wheeler being ahead with 105 out of 125 shot at. In the badge shoot, No. 5, Wheeler and Storey tied on 22 each for the class A badge; this tie will be shot off later. G. R. Vine won the class B badge, Jay Brown winning the badge in class C. Event No. 7 was at 5 pairs. Scores were:

Boston Gun Club.

WELLINGTON, Mass., March 10.—Fifteen shooters journeyed to Wellington to-day for the regular Wednesday afternoon shoot of the Boston Gun Club. This was the seventh in the series of fifteen, and the interest is growing with each succeeding contest. Five have already placed six scores to their credit, and as many more have five; six scores composing the prize total, the remainder of series will be devoted wholly to improvement with the regular attendants. Mr. Spencer was high to-day both in the match and percentage, and is certainly at present shooting somewhat above his handicap. His early scores not justifying any change, his handicap distance holds good for this series, as the rules admit of no alteration after three competitions by the shooter.

Below are complete scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14
Targets:	10	5	6	10	10	6	10	10	5	6	10	10	10	10

W. S. Edey vs. C. H. Mackay.

A MATCH that created a lot of interest among the clubmen of New York city was that which was decided on the grounds of the Country Club, Westchester, N. Y., on Thursday, March 11. The principals were W. S. Edey and Clarence H. Mackay, of California. The conditions of the match were 100 live birds, 30yds. rise, 30yds. boundary, Edey conceding three misses as kills. Under such conditions, and as Mackay has been shooting very well of late, it was thought that Edey had the worst end of the match. Mackay is only a new man at the traps, but is developing into a first-class pigeon shot.

At the start it looked odds on Mackay, the first 25 showing 22 to 19 in his favor. The second 25 was 20 to 19 in favor of Edey, the difference in the scores at the half being 41 to 39 in favor of Mackay. From this point Edey settled down and did the best work of the match, running straight until the 75th round, making in all a run of 28 straight. Such shooting as that usually has its effect on a match, and in this one it made all the difference in the world. Mackay lost his 51st and 55th both dead out of bounds, and the score was thus a tie. Then he lost his 56th, 61st, 64th and 70th, giving Edey a lead of 4 birds. Both men lost their 75th birds, so the last string of 25 was entered with the scores showing 63 to 59 in favor of Edey.

It began to look like anybody's race when Edey lost his 77th, 79th and 80th birds, Mackay meanwhile killing his birds. This reduced Edey's lead to 1 bird only, with 20 more to shoot at. Then came a fatal break on the part of Mackay; he lost his 81st, 82d, 83d, 86th and 87th birds, Edey also losing his 85th and 87th birds. Thus Edey again had his lead of 4 birds. With but 5 birds to shoot at Edey had just a lead of 3 birds, enough to make it a tie. Mackay, however, lost his 95th and 99th, making Edey's lead 5 birds, and giving him the race with a margin of 2 kills.

The race was refereed by Fred. G. Moore. Edey handled himself, but G. S. McAlpin handled Mackay. The scores show that Edey scored 80 out of 100, with 10 dead out of bounds. Mackay scored 75, with 7 dead out of bounds. Scores were:

Answers to Correspondents.

No notice taken of anonymous communications

A. S., Philadelphia.—The breeders of Great Danes and wolfhounds do not furnish the necessary information by advertising, hence we are unable to furnish it as you desire.

H. A. W., Troy, N. Y.—My setter is troubled with lice I can find nothing that will kill them. Will you please tell me what to use? Ans. Rub all over the dog a mixture of equal parts of kerosene and cottonseed oil, wash off in a day or two. Also well wash and scrub the kennel, and sprinkle sulphur all about it.

A. K., Williamsport, Pa.—I have been approached by a friend in regard to procuring for him an old rhyme, which refers to an old country divine who was fed by his parishioners on rabbits until he got tired and broke out in a poetical effusion, which winds up that he does not want any more rabbit on his plate, etc. Now could any of the FOREST AND STREAM people help us out and give us the whole rhyme? The same would be thankfully received. Ans. It was Dean Swift, who was partial to rabbit. Knowing this, two ladies, with whom he was invited to dine, set before him a rabbit dinner, at the conclusion of which he returned thanks in this vein (we quote from memory):

"Rabbits hot and rabbits cold,
Rabbits young and rabbits old,
Rabbits tender and rabbits tough,
We thank the Lord we've had enough."

PUBLISHERS' DEPARTMENT.

Thomas J. Conroy.

T. J. CONROY has moved back to the neighborhood of his old place of business after an experience of several years on Broadway. His new address is 28 John street, which is only a stone's throw from lower Broadway, and at the corner of Nassau street.—*Adv.*

For Field Shooting

The "Vena Contracta" gun, which is a 20-gauge gun shooting 12-gauge cartridges, is meeting with considerable favor on the other side of the water. Its chief advantage is light weight combined with extraordinary killing power. A gun weighing about the same as an ordinary 20-gauge is said to possess the killing power of a 12-gauge without increased recoil or other disadvantage. Sportsmen who are interested in this gun may obtain further information by addressing the manufacturers, Messrs. Joseph Lang & Son, 10 Pall Mall, S. W., London, Eng.—*Adv.*

FROM SNOW TO SUMMER IN A LITTLE OVER TWENTY-FOUR HOURS is a quick and startling transition, but improved railway travel has accomplished it. Good roadbeds, handsomely-equipped trains, record-breaking time make a trip from New York to Florida a pleasant one. The Atlantic Coast Line *via* Richmond is one of the most popular lines to the South. In connection with the Pennsylvania Railroad it carries passengers in solid vestibuled, steam-heated and electric-lighted trains, known as the "New York and Florida Special," from Jersey City to St. Augustine in exactly twenty-seven hours. It also has fast through car service to Aiken, S. C., and popular Georgia resorts. The bureau of information is at 229 Broadway, New York.—*Adv.*

ON A FOWLER.

With reeds and birdlime from the desert air
Eumelus gather'd free, though scanty, fare.
No lordly patron's hand he deign'd to kiss;
Nor luxury knew, save liberty, nor bliss.
Thrice thirty years he lived, and to his heirs
His reeds bequeathed, his birdlime and his snares.

Isidorus.

"THE HALLOCK CODE."

THAT is an extremely interesting scheme which has been formulated anew by Mr. Charles Hallock. It is a code of game laws so devised that certain belts of territory, embracing all States which lie within corresponding isothermal lines, shall be governed by laws prescribing uniform open and close seasons. For the purpose of practicable grouping Mr. Hallock designates contiguous States in what he terms concessions, as follows:

"NORTHERN CONCESSION.

"The following named States comprise the Northern Concession, to wit: The six New England States, the Middle States, the two Virginias, Ohio, Kentucky, Michigan, Illinois, Indiana, Missouri, Iowa, Wisconsin, Minnesota, the two Dakotas, Kansas, Nebraska, Montana, Wyoming and Colorado, to the summit of the Continental Divide.

"SOUTHERN CONCESSION.

"The following named States comprise the Southern Concession, to wit: North and South Carolina, Georgia, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Florida, Texas, Indian Territory and New Mexico, to the crest of the Continental Divide.

"PACIFIC CONCESSION.

"The following named States constitute the Pacific Coast Concession, to wit: Washington, Oregon, California, Idaho, Nevada, Utah and Arizona."

We have said that the scheme has been presented anew, because it is in general scope by no means novel. The plan of uniform game seasons for adjoining States has been cherished by Mr. Hallock for almost a quarter of a century, and his suggestions to this end were originally promulgated in the FOREST AND STREAM more than twenty years ago. In the early 70s he was, in these columns, preaching the doctrine of uniform legislation, and was engaged in an enterprise of generous scope to give form and force to the idea.

It was about that time that one of the earliest in the series of national sportsmen's associations was formed, and shortly thereafter came an international association, comprising a membership extending from Newfoundland to Texas, and from Vermont to California, and embracing not only prominent sportsmen, but many noted naturalists and scientists of the United States and Canada. Never before had there been collected such a noble array of names; never has there been one since; we question if ever there will be such again. If the most distinguished list of sponsors, if the most advanced scientific attainment, if the abundant lore of naturalist and warm enthusiasm of sportsman could ever avail for the purposes of the movement, one would think that they might have been powerful here. Committees were appointed to study the habits, breeding times, legitimate open seasons, and to supply various other data considered essential to the preparation of an adequate legislative system of protection. But absolutely nothing ever came of it all. This international association was in character and extent of membership a giant to the pigmies which have succeeded it in the series, down to the grotesque Kalamazoo, Mich., concern of our own day. But it never made any progress beyond the "whereas" and "therefore be it resolved" stage; no national sportsmen's association ever has done more than this, nor in the very nature of things ever can.

Although the influence of the national association and of the international association was decidedly beneficial, since it stimulated interest in game protection throughout the country and prompted the organization of numerous State and local associations to engage in the good work of enforcing the laws and awakening public interest in the cause, neither of these did anything whatever of a practical nature toward putting into effect a system of uniform game laws.

Many years have passed since that first movement. At this time, when Mr. Hallock brings out again his plan of uniform legislation, the conditions are far different with respect to public appreciation of the merits of game protection. We have made prodigious advances since the early 70s, and it might be thought that we had reached a stage where Mr. Hallock's scheme would be given a very different reception and when it might possibly be put into effect. A study of the conditions as they exist to-day, however, we regret to say, will show that we are as far as ever from the possibility of a game law system providing for uniform seasons throughout States included within the same isothermal lines. Only in rare instances have advances been made from the local and county game protective legislation, which obtains in many States, to a broader system of a uniform code for the entire individual State. Until we can agree, as sportsmen of an individual State, on a law which shall give satisfaction throughout the entire borders of that State, it is foolish to talk about adopting a law for two or three States or any number of States so contiguous. In all the larger commonwealths the sportsmen are at odds as to what they themselves want in their several localities. In New York, for instance, where a uniform game code was adopted in 1892, the Legislature has been flooded annually with measures from counties and towns asking special exemptions for restricted localities. The same principle holds elsewhere. The first step toward a realization of Mr. Hallock's scheme would be a system of State laws throughout the Union which should provide for each individual State uniform seasons throughout its own territory.

There have been various conferences of the fish and game commissioners of certain groups of States—in Boston, for instance, representing New England, and in Minneapolis, representing Minnesota and its neighbors—but nothing has ever come of these movements.

We have the heartiest sympathy with Mr. Hallock's projected system. It is based on sound reason. A law which adequately protects quail in their breeding season in one State would quite as effectively protect them during the same season in a contiguous State. The Hallock code is, in its general outline, a code of common sense. We believe that in the end it will be adopted, although there is a moral certainty that no child born in this year of grace will live to see it.

The lesson for every individual sportsman, every village protective club, every county and State association to learn is that the present, immediate, most pressing and most effective, efficient and valuable work we can put our hands to in this field is the enforcement of our own game laws in our own town, county and State. The place to begin is at home. The work for us now is home work.

But it is so much more attractive—because so much easier—to dream about uniform laws to govern the whole blessed Union, and which shall enforce themselves by the might of their own perfection.

NEW YORK ZOOLOGICAL SOCIETY.

THE publication of the first annual report of the New York Zoölogical Society marks the end of a year and a half of energetic and successful work.

Briefly, the history of the Society up to the present time is this: The act of the New York Legislature incorporating the Society became a law April 29, 1895, and an organization was effected during the summer of the same year. Some time was spent in the consideration of available sites, and a committee of three experts was requested to come to New York and report on this subject. In April, 1896, Mr. W. T. Hornaday was engaged as director of the proposed zoölogical park, and after a careful study of all the proposed sites, on May 21 application was made to the Commissioners of the Sinking Fund of New York city for an allotment of land, consisting of 261 acres in South Bronx Park, to be used as a public zoölogical garden. This application has been approved by the public press and by the New York Park Commissioners, and it is believed will be favorably acted on by the Commissioners of the Sinking Fund within a few days. If the grant shall be made, the city of New York will have made the first and most important step toward setting on foot by far the largest zoölogical garden in the world.

Up to this time nothing has been done looking toward the acquiring of money to carry on such a park, the directors very wisely believing that until the city, by giving the institution a habitation, had done its part, the question of funds might be set on one side. So soon as the matter of site is settled, the Society will set about the work of raising the $250,000 which it needs in order to begin operations.

The objects of the New York Zoölogical Society as set forth in this report are:

First—The establishment of a free zoölogical park, containing collections of North American and exotic animals, for the benefit and enjoyment of the general public, the zoölogist, the sportsman and every lover of nature.

Second—The systematic encouragement of interest in animal life or zoölogy among all classes of the people, and the promotion of zoölogical science.

Third—Coöperation with other organizations in the preservation of the native animals of North America, and encouragement of the growing sentiment against their wanton destruction.

Certainly these are objects which will receive the approval of all intelligent persons. The executive committee rightly places first the establishment of the park, since it is only by this means that the great public can receive the enjoyment and instruction which it ought to be the main object of such a society to furnish. Such a park should contain collections kept under conditions as nearly like those of their native homes as possible, with abundant room for the animals to roam, yet not so much room as to enable them to hide away out of sight of the visitor. The purpose then is to make this park stand midway between the small zoölogical parks of Europe, where the animals are confined in small pens, and the great private game preserves where they can conceal themselves in the forests and can seldom be seen. To such a purpose the site chosen by the Society is well adapted, for it is greatly diversified in contour, and admirably furnished with trees, underbrush, open glades and rocky hillocks.

It will naturally be the first object of the Society to bring together a series of North American types, and of these the great game animals will be the first chosen. Buffalo, moose, elk, mountain sheep, caribou, antelope, the various deer and—if the climate will permit—the white goat will be secured. Bears, wolves, foxes and other mammals less in size will find their place here. The abundant water areas offer every opportunity for the care of wildfowl of every description, and in open spaces and closed aviaries there will be many sorts of land birds as well. The more striking exotic animals, though they will be secondary to the native forms, will in time be gathered here.

It is the purpose of the Society to devote especial attention to the matter of labeling the collections, realizing that, when this is done as it should be done, the value of any collection is quadrupled. With the labels will no doubt go maps giving the geographical distribution of the species.

The question of the issuing of publications is one which is as yet far in the distance for the New York Society, and its consideration may be postponed for the present. It believes that its collections ought to be made available to all artists and sculptors, and that thus they may have an indirect educational influence of very great value.

By increasing the interest in our different wild animals, the establishment of such a park should stimulate the forming of new game preserves all over the country. Fortunately many such preserves exist to-day, but it is greatly to be desired that their number should be increased. It is only by the establishment of such preserves that many of our wild animals can be preserved from extinction. If an adequate system of forest reservations and forest protection shall ever be established in this country, this will do much to preserve the game, but the adoption of such a system does not seem to be imminent.

The aim of the zoölogical society is to establish a free zoölogical park in New York for the benefit of the whole public. As its collections are to be open to the public practically all the time, it can hope to derive no revenue from admission fees, but must depend on the public spirit of wealthy citizens. It requires $250,000 to put the park in shape to receive collections and to purchase its animals. It requires also a large membership whose annual fees shall meet its current expenses. As yet it has never made any effort to increase its list of members; but so soon as its site shall be allotted, and when its purposes and its needs are known, it cannot be doubted that a large number of persons interested in science, in sport, and especially in that class of our population which is to derive the greatest benefit from such a park, will be anxious to join the Society and to contribute to its needs. Its objects are most praiseworthy, and it is entitled to the cordial support of the public.

The Sportsman Tourist.

TALES TOLD BY THE CAMP-FIRE.—I.

BY AMATEUR.

SOME tales have been told by the light of the wood fire in the shades of the mighty woods, now so rapidly becoming a thing of the past, and under the clear night sky, which seem worthy of being preserved. But how? The writer knows of but one way, and that is, if you think as he does: to embalm them in print.

Six of us had gone out to Hoy's Wilderness in Maryland for a three weeks' hunt back in 1884. Hoy's Wilderness was the favorite hunting grounds of old Meshack Browning, the great Maryland bear hunter, who killed more bears than I care to mention. Originally, most likely, a swamp, it has to a certain extent dried out, and is, or was, a mass of trees, briers, heavy grass, undergrowth, and all that goes to make it what it is called: a wilderness. Here and there are log cabins, but at long distances apart, and who built them or occupied them no one seems to know, and no one cares. They are tenanted from time to time by parties of hunters such as ours, among whom is a sort of unwritten law that on breaking camp whatever may seem to be useless to those vacating the premises shall be safely stowed away in the cabin, to be used by any one coming thereto and needing the same. Thus it was that when we went into our cabin our guide found in a cupboard two bottles of whisky, a 2lb. canister of powder, a bag of shot, two or three boxes of gun caps, a ham in canvas and in good condition, a lot of empty shells for shotguns, and two sets of reloading tools, one 10 and the other 12-gauge, besides a lot of miscellaneous other things. None of these were used by us, but the supply was increased when we left.

Our guide, who was going away as soon as he saw us safely housed, to return, however, from time to time during our stay in the cabin, remarked to us as we were fixing up:

"I want to tell you fellers this isn't the safest place in the world, for you all seem so mightily tickled with it. Back in 1878 I brought two young fellers here, and I've always been mighty sorry that I did bring 'em. They were nice young men. You must bear in mind that there's painters in Hoy's Wilderness, and they're just as savage and dangerous as any animal anywhere in the world. These two young men were from Pittsburg, Pa., and they had a good outfit, but they weren't woodsmen. After I'd left 'em they got along all right, till one evening seemed like an awful storm was coming up; the sky was getting overcast, and occasionally you could see a flash of lightnin'. They were standin' in the door there, when they heard a cry that sounded off yonder in the woods like a woman or a child in distress. They looked at each other, and one said:

"'That's surely a child. We can't let a child be out in such a storm, and the youngster doesn't seem far away. I'm going out to see what's wrong.'

"'No,' said the other, 'we'll both go.'

"'No, we won't;' said the first. 'You're the cook this week, and you git supper and I'll go out and find the youngster; and when I get back we'll all have something hot to eat.'

"He was about starting off without any gun or any other firearms, when his partner told him he'd better take a gun. And he did take a .44 Remington rifle, rim-fire, and half a dozen or so of cartridges besides the one in the gun, and left to hunt the child.

"The other went ahead getting supper, and finally sat down and waited, and waited, and kept on waiting. Meantime the storm blew around, the clouds drifted away and the moon came out. The young feller that was left here in the cabin hadn't heard any more of the child, except once after his partner left him, and then he noticed that the sound seemed further away than it had been. He set here and played cards with himself—there is a sort of a card game that I've seen fellers play all by their lone selves, an' seem as much tickled over winnin' the game as if they was playin' for money and had won a whole pot, but I never could get the hang of it; mebbe some of you fellers can play it. Well, he set an' played that game till about 10 o'clock an' more, an' then bein' religiously inclined he read a chapter out of the good book, said his prayers, took a drink o' whisky and went to bed, leavin' the supper set out so that when his partner came in he'd have somethin' to eat.

"When he waked up in the mornin' his partner wasn't there, so he ate his breakfast, and was powerful uneasy, because I had told 'em there wasn't another cabin nearder 'n twenty or twenty-five miles off into the wilderness; and you know it's about twenty mile back to where we started from this mornin', and them fellers and I started from the same place.

"Well, he got so troubled in his mind that he took his gun, a Winchester of 1873, filled up the magazine, an' took a lot o' cartridges an' started out after his partner. They had a dog with 'em that belonged to the missing man, an' he turned this dog loose, an' the dog started off right on to the trail, an' led him an awful round, so that he was really lost, but he managed to keep with the dog, and the dog kept the trail. At one place back here in the woods, some place, I don't know exactly where, he saw blood and hair of an animal, and the dog got very much excited, and from time to time he saw more blood, but not all the time, and the dog kept on the trail, till at last the feller found the trees an' things lookin' familiar, an' about a half a mile up yonder in the woods he walked out on to a monstrous big painter dead as a door nail, and under the painter was his partner, and he was dead as a door nail too.

"When he found his partner in that condition he felt powerful discouraged, but he managed to roll the painter off of him, an' he picked him up an' carried him here to this very cabin, and here he found me, for I'd agreed to come back occasiona ly, just as I have with you fellers; an' I felt scandalous when I saw him come luggin' in his dead partner, and when he saw me he just fainted clean away. Well, I got him to, but he was ravin' crazy. I took him and the corpse home with me, an' then I came back, and skun the painter, an' I have the hide at home, an' my old woman uses it for a bed quilt in extra cold weather. Friends come an' took 'em both away, the dead and the livin', an' I do hear tell the live feller's into a 'sylum up in Pennsylvany, a ravin' man'ac; an' I do hear too he got well an's a-keepin' a store in Pittsburg; but he's lost all stomach for the woods, an' if anybody asks him to go huntin' or shows him a gun he goes off an' gits drunk as liquor 'll make him. I dunno which is so, but havin' pious notions into him I 'spect the last tale's true an' that he's a storekeeper.

"Now you fellers remember, there ain't any women wanderin' round loose, nor no babes in the wood, sitiated in Hoy's Wilderness, an' if you hear any of 'em hollerin' in distress you'll know it's a painter, an' house yourselves up, an' keep away from it. That's all."

[SECOND TALE TO BE TOLD NEXT WEEK.]

SECOND CRUISE OF THE CURLEW.

THE Skipper, the Surgeon and the Soldier had many anxious thoughts about certain ducks they had seen flying over the trees and dropping behind them on a little island in Story River. The appearances seemed to indicate that there must be a small pond there, and if it should prove true it would be a good place to sit calmly down in improvised stands and knock them over as they came in.

So these thoughts finally crystallized into a fixed determination to go again. The Curlew was accordingly provisioned and the trip undertaken. The Clerk was too busy and could not go, but the other three had a look of stern determination about them, and it boded no good to any ducks that might come in sight. The breeze was fresh and fair down the harbor, and the expedition made sail and departed. The run to the mouth of Station Creek, with the help of wind and tide, was quickly made. Two reefs were taken in the sail to prepare for the windward work in the creek, but the declining sun took the wind with it, and at dark an anchorage was found at the 'Doctor's cross over," so named because the enthusiastic Surgeon saw a few birds flying across the marshes at that point on the first cruise, and his ardent soul imagined that the flight would go on forever. They did not find it so, although the Soldier paddled about until it was too late to see and picked up a few birds. It was with sighs of deep content that the party gathered at the supper table, richly stocked with Elliot's choicest efforts, and tobacco tasted good that evening, while the guns were cleaned and put away in readiness for another day.

The other day dawned fair, warm and calm. Light zephyrs, a little tide and the oars took us nearly through the creek to Trenchard's Inlet, but an adverse tide and night came together, and we anchored, ate and slept, like honest people. On this day we made acquaintance with the Dutchman. This person was the skipper of a light draft old trading sloop, hailing from Charleston. When we first found him he was ashore in the mud on one side of the creek, and we smiled superior and kept afloat. We were struggling against the tide with a light wind, and advancing very slowly. He hailed us with a Scandinavian brogue, and we had some conversation, christening him the Dutchman. He was a person gifted with great tenacity and a way of engineering his old sloop through a creek that was amusing. He soon got his craft afloat, and then taking the bank on the best side of the river, he and his crew with poles soon overhauled us, and we were left behind. When we could get a leading breeze we could beat the Dutchman, but when the breeze fell the Dutchman could beat us. Finally, however, we anchored side by side at dark, after a snail's race lasting several hours.

In the night at the turn of the tide the Dutchman weighed his anchor and went on his way, while we slept the sleep of contented hunters and remained where we were. At daylight we tried again and made Story River in good time, struggling with an adverse tide and a capricious wind. As we approached the suspected island an intense nervous expectancy seemed to possess the ardent souls of the Surgeon and the Soldier. They smoked freely, filling their pipes frequently. They searched the sky, the water, the marshes. They marked the flight of every duck in sight, and at last they could stand the delay no longer. They tumbled into one of the boats and pulled vigorously up the river, in ent upon spying out the land. Soon they disappeared among the marshes, leaving the Skipper to beat the Curlew slowly up the river, until the falling tide left her on a mud flat and there was no more to do.

Then arose the thunder of the guns from the direction in which the gunners had disappeared, and the frequent discharges seemed to indicate that they had found "meat." As the sun declined they returned with ducks galore and stupendous appetites. The tide floated the ship, and she was worked up to a convenient anchorage, and Elliot made us happy with one of his Delmonico dinners. Suspended in the rigging, the ducks looked finely and made a brave show, and the Surgeon chuckled to know that his observation was corroborated by finding an ideal duck pond and ducks in it. Tobacco was balmy after dinner, and reminiscence and anecdote were pleasing and inspiring. Solid sleep followed after, and all trouble vanished with the echoing resonance of the Soldier's snore.

The next morning dawned gloomy and windy, with rain in the air. Nothing better could be imagined for ducks. After breakfast the party prepared for action. The Skipper encased his ponderous limbs in long rubber boots (built especially by Goodyear and launched on *ways*), unfolded his enormous oil coat and "sou'wester," reached down his old 10 bore Parker "Destroyer," and announced that he was ready. He rolled into the boat with Jerry and the party started. Fortunately the pond was not far from the landing and soon all hands were in stands about it, with the gentle Jerry for retriever. Soon the fated ducks began to come in, and for about four hours the shooting was as good as one could wish. Imagine, if you can, a small pond, just large enough to shoot across, and to be covered in every part by three or four guns. Around this the lofty pines, through which half a gale of wind was whistling, while the underbrush came to the water's edge, making good shelter. The sky was lead-colored and threatening, while frequent showers drove slanting over and through the trees. A long drought had dried up many of the ponds, where the ducks were accustomed to go, but this one had water in it. The three shooters were snugly placed on the weather side of the pond, and there you have the situation. If you, Mr. Editor, in your sanctum on the slippery side of Broadway can map out a more favorable chance, or combination of chances I would like to hear how you do it. It was a great day, and I fear I shall not see another like it for some time. Later we visited the same pond on another cruise and found—but that is another story and must await its turn.

Well, the ducks came in, "sometimes one in a flock and sometimes two single ones," as a man on Cape Cod once described it, but very few ducks that dropped in that pond that forenoon escaped alive. It was fine. The Skipper's old Destroyer was clearly "in it" until the ammunition failed, and then the party returned, well loaded down with prey. The satisfaction with which the hunters absorbed food and other comforts was heightened and intensified by the appearance of the rigging, where ducks hung "solid."

Once, when the Skipper went down to the lower end of Paris Island after beach birds, he took a camp stool and Bennett, a faithful adherent, along. Deliberately planting the seat on a prominent point, with Bennett lying on the ground behind, and lighting the pipe of peace, he awaited prey. It came. Flock after flock of small birds came whirling in, and shot after shot knocked them out, until Bennett, tired and panting from picking them up, remarked: "For de Lawd's sake, Cap'n, don't shoot any more. You got anuff now."

That was the way we felt after our great duck shoot; so the next morning we filled away for home, happy and contented, and arrived safely, and served out the "meat" among our friends. Verily, "out of doors" is better than "in the house."

C. H. ROCKWELL.

U. S. NAVAL STATION, Port Royal, S. C

ON THE JAMES.

THE title of this article is suggested by the extremely interesting communication in the FOREST AND STREAM of March 13 by James Norris, headed "On the Potomac." The James, in no less degree than the Potomac, from Newport News to Point-of-Fork, teems with historic interest, and deserves to be styled, equally with the Potomac, a classic river of America. Born and reared almost on its very banks, for the half century of my existence it has been the stream which has afforded me the greatest enjoyment when seeking recreation with rod and gun. But it is not with the intention of giving my personal experience that I write, but to mention facts which are not generally known to your readers, which I am sure cannot fail to interest refined and intelligent persons of the class to which it is evident that Mr. Norris belongs. I shall not refer to great historical figures like George Washington or Robert Edward Lee, neither will I mention such well-known places as Jamestown or Westover; but I will confine myself to my own little county, Goochland, and mention only the people who have dwelt here; not that we arrogate to her any superiority in this regard over the other twenty odd counties which border on the James, but because I desire to tell something that is unknown to most of your readers, and because if one little community, which is but a fair sample of the entire region referred to, can make such a showing, that of itself will go far toward sustaining the claim to distinction asserted on behalf of the James.

Goochland is a small county, with an area of about 300 square miles, situate west of Richmond, and bounded on the south for forty miles by the James. There are in the river numerous islands, which make it a favorite resort in the winter season for geese and ducks; and its fertile lands and beautiful scenery have ever made this portion of the valley of the James a favorite residential section for the wealthy and refined people of Virginia. As an illustration of the beauty of the country naturally, I send you a sketch of Snowden, the seat of the late Richard Selden, Esq., situated in the western part of the county, made by the Hon. John S Wise and appearing in his forthcoming book, entitled "Diomed." The very names of the families who formerly dwelt along this valley—viz.: the Pleasantses, Bateses, Randolphs, Seddons, Seldens, Stanards, Flemings, Carters, Skipwiths, Harrisons, Bollings and others—were the synonyms of social elegance and refinement. In all the broad field of periodical literature of to-day there are no more brilliant writers than were two men raised here: John Hampden and Hugh Rose Pleasants. The former was the darling of the old Whig party of Virginia, and his early and tragic death—he was killed in a duel—created a profound sensation over the State.

Upon the eastern borders of Goochland, and on a hill above the river, is historic Tuckahoe, the seat of the Randolphs, and the home of Thomas Mann Randolph, a governor of Virginia; and near the old colonial dwelling house is still to be seen the schoolhouse in which Thomas Jefferson went to school. In the same quarter of the county James Pleasants, another governor of Virginia in the days of her wealth and prosperity, was born and raised; and not far off there was born Gen. Nathaniel Massie, one of the early pioneers and distinguished men of the State of Kentucky.

Higher up, and on the banks of the river, is Sabot Hill, the home of the late James A. Seddon, a distinguished lawyer, a member of Congress of the United States, and a secretary of war of the Confederate States. Still higher up was the residence of Judge Stanard, one of the ablest and most learned judges who formerly graced the bench of Virginia's highest court, and whose luminous opinions fill many a page of the published reports of the decisions of that court. And upon the same old plantation, on an eminence above the river, a solitary tree now marks the spot where the home of the Bateses once stood. Here there was born and reared a man who became a lawyer, one of the most distinguished of his day. There is now in Lafayette Park, St. Louis, a monument dedicated to his memory. His name was Edward Bates. He was a distinguished judge, a governor of the State of Missouri, and attorney-general of the United States under the administration of Abraham Lincoln. Thus in time of great civil upheaval, when the country was divided between two great contending parties, and when the services of the ablest and best intellects were called for in the councils of state, this same little community furnished a cabinet officer to the Government of the Confederate States and a cabinet officer to the Government of the United States.

Two miles west of Belmont, the seat of the Bateses, and in an old colonial house, a part of which is still standing, and which is still owned and inhabited by the descendants of the Englishman who settled on the place in 1685, there was born a youth who in early manhood went forth to the then far backwoods to make a home and fortune. He became a citizen of the State of Mississippi, and there attained to great eminence, holding many public positions; among others he was a senator in the Congress of the United States, and governor of Mississippi, and one of the counties in that State was named after him. His name was Walter Leake.

Still further in the western part of the county an old Dutch roof mansion stands to day, which was the residence of a distinguished physician. He was a poor boy who educated himself so thoroughly that he became an accomplished classical scholar. In course of time he became the family physician and personal friend of Thomas Jefferson, and when that great man became the rector of the University of Virginia he had become so impressed with the abilities of his friend, the physician, that he twice tendered him the chair of medicine in that institution. The physician was Dr. Andrew Kean.

When the late war broke out there dwelt in Goochland one whose mortal remains now rest in Hollywood, that lovely

city of the dead, west of Richmond. David Bullock Harris was a distinguished graduate of West Point Military Academy, possessing virtues and talents of the highest order. He was engaged in civil pursuits, where he was amassing wealth, but although he was opposed to secession, when his native State called her sons to arms he left all and entered the "tented field." He served with great distinction as an engineer officer, and was the man who had the magnificent fortifications constructed at Charleston which defied the Union forces by land and sea until Sherman came up in the rear. In 1864 he was promoted to the rank of brigadier or major-general and sent to take command at Charleston, but was immediately seized with yellow fever and died.

And thus I might go on and give the names of others, women as well as men, citizens of this little county, who attained eminence, and made their mark on the world's progress, but I will content myself with one other instance, and that from the gentler sex.

Not far from my summer residence in this county, and upon an old colonial road called the "Three Chop" road, a patch of briars and an old chimney alone remain to indicate that a dwelling once stood there. Here there dwelt in former days a tavern keeper, who had a little daughter, a bright and attractive child, upon whom he lavished his love. She became a gifted and accomplished woman, and in the course of time met Mr. James Madison, then Minister to France. He addressed her and she became his wife, and when he afterward became the president of this republic she was for eight years the mistress of the White House, and all contemporaneous writers agree that, being possessed of an attractive person, a cultivated mind and exceeding grace and charm of manner, she fascinated all who came within her reach. Such is the brief story of little Dolly Payne.

And so this beautiful valley and lovely river is not only dear to us for the happy hours we have spent in hunting along its banks and fishing in its waters, but for its nobler associations Our past is not a "dead past," as some would have you believe; but it is a storehouse rich in examples of all that is loftiest and best in human nature, from which we may draw inspiration to meet the conflicts and vicissitudes of life, which inevitably lie before us, with strength and courage.

M., OF NORTHSIDE, VA.

IN IDAHO MOUNTAINS.—II.

(*Continued from page 144*)

THERE were other appearances of that bear which Jim and I had abandoned at the willow jungle, as told in your issue of Feb. 20, and this paper is to touch on one or two of them; but in the first place I am tempted to relate an evening's experience with elk which had some especially picturesque incidents.

The mountain south of camp was lofty and precipitous. Its shoulders were grown deep with rich pasturage and sparsely timbered. Its top a park-like mesa with scattered timber. Deep gulches seamed the face it presented to the river, and here the shelter and lingering moisture favored a heavy growth of both timber and underbrush. This shade drew most of the life on the mountain as refuge from the midday sun. Nell, Jim and I ventured into the deepest of these draws one afternoon about 4. I am not aware that we had any very definite purpose. The spot was wild and interesting in itself; it was tracked and marked with signs of varied wild life; it was dark already with the shadow of its western edge. There was mystery and uncertainty at every advancing step. Here was uncorrupted primeval nature. It would have fitted my mood perfectly to have left our rifles at camp, but we didn't. The habit of being prepared to kill is viciously persistent when once acquired; and few there are, in my experience, who put it aside for the more rational pleasures of quietly walking as an animal disposed to be friendly among other animals of equally kind disposition; but, as I say, we had our rifles—Jim's, a single-shot, rusted gun, with a cartridge of indefinite age in its barrel; mine, an orthodox Winchester, heavy as a sky-scraper.

We proceeded quietly along the game trails, stopping occasionally to unlimber a rubber drinking cup and wash out our mouths, dried in that parching air.

A Steller's jay, I remember, found us out and was greatly amused at our appearance; at least his voice seemed to laugh and his bearing was certainly gay. The plain, uncrested, gray jays were there too, bearing the air of tramps and mendicants, as they always do. Not that the Rocky Mountain jay is ever less than a jay—and that always means a certain briskness and debonair air—but they, like our own Canada jay, are the poor relatives, with serious temper and earthy ambitions, as compared with others of the family—about the difference that marks the Chinaman from the Frenchman.

Bruin too was about—not visible, but signs of his housekeeping were frequent. At one spot lay in the path two or three quarts of service berries, with which some youthful stomach had been overloaded.

As we approached the summit, elk sign was fresh and plentiful. It was hardly a surprise, therefore, when a well-antlered bull lumbered up from his lair and, obeying the inexorable law of his nature, broke away up the hill. A snap shot or two, and he was gone to the eye, but present to the ear in a long train of fading crashes through the timber. Nell was after him like a flash, yelping like a gatling gun. A crimsoned leaf found in the path of the flight placed on us the duty of following to the death, despite the lateness of the hour. When we had made our labored way to the crest of the mountain, Nell's faint barking, now intermittent, told of the stag at bay; not for long, however, for almost at once the elk turned again from his pigmy pursuer, and this time stopped not, but passed out of hearing for good. In the meantime the sun was down, the moon was up, we were some miles from home. We turned down the bed of a small stream into a ravine other than the one from which we had just come and started for home. Nell joined us shortly. Suddenly from directly behind us there came the sharp challenge from an elk's whistle. This was taken up and answered from across the gulch. Again it sounded from behind us and nearer. It was a chance quickly seized by Jim. From somewhere out of his ungainly face there came the voice and the language of a belligerent, defiant, love-lorn elk. In instant answer came reply from the hillside above us, and now so near that his footsteps were audible. Then silence, and in the darkness above the fancy pictured that stalwart, proud figure, listening like a knight of old for the summons which might tell him exactly the location of his rival. Again Jim sent up his treacherous challenge, at the same time cautioning me to be ready and shoot on the count of three when the elk appeared. This time no answer came, but a plunge and a clatter, and then there stood before us in the moonlight, his silhouette set into the western sky line, this bristling champion.

The rest of the story is one of shame, and should be quickly told. At the count of three we fired point blank, with no sights visible in the darkness. I felt like a midnight assassin when that gallant figure rolled almost to my feet, stone dead. His head I have, and I suppose when the question is asked I still say in cheap sportsman pride, "I shot it;" but I am glad of the poor satisfaction of knowing that the bullet we dug from that body does not and never could fit my gun.

Our experiences with bruin were of a desultory and inconsequent kind for some days after the first meeting. Once the Major had brought him out of cover for a hurried reconnoissance by mistaking his movements in the hemlock for those of a little band of elk, known to be near; but he vanished as quickly as a seal's head in a smooth sea—it was a trick he had. But there came a day when he multiplied himself by seven and showed up at all points of the compass at once. It was this wise.

The rascal, Time, had taken from the Major the activity of youth. He was burdened with those leaden pounds which weigh down too often the sporting spirit of fifty and over, and so handicapped the Major had missed his share of the game. To set the scales even, a game drive was determined on, of which the Major was to be the sole beneficiary. Conditions favored the plan. A broad, open gulch seamed the mountain from foot to crest on a line which bisected, or nearly so, a great stretch of timber. Game traveled back and forth from cover to cover across this space. The eye of a man placed here could have within its field everything which attempted the passage. The Major was accordingly seated in comfort at a point of vantage. His spectacles were fresh dusted for the doings of that day; his rifle cleaned and recleaned; his field glasses drawn and placed by his side. So was he left, like the dauntless band at Thermopylæ, to hold his pass. Jim, the cook and myself started on our detour to get on to the mountain side a mile below. The plan was for Jim to take the bottom, the cook the middle and myself the top. Then to advance toward the Major's position, storming like Populists.

We did that very thing. We had that hillside moving like a Roman chariot race inside of five minutes. Elk, coyotes, red deer, blacktails, owls, bears got up and dusted from that bedlam like fire horses when the button is pressed. Jim's Sioux war whoop almost stampeded me, and as various beasts passed me they carried their ears and eyes cocked back toward those awful screeches. I escaped being tramped to death, and at length reached the extreme upper end of the Major's gulch.

Now it came to pass that on three occasions during the progress of our tantrums back in the cover the Major had indulged in clusters of from two to five shots, so that now that I was through my part of the work I hurried to see the results to show therefor. When I came within eyesight of the Major's countenance I beheld almost a stranger. A man stood before me who clearly had passed through impressive experiences. I should think any man might carry a similar expression who had suddenly lost his mother and simultaneously seen the ghost of Julius Cæsar. I called from afar: "Major, what did you get?" He took off his glasses, slowly wiped them, and made no answer. The query was repeated; still no reply. I was now almost at his side. He slowly arose to his full stature and still in partial trance; addressing his own thoughts as much as me, he said, "I have had an exceedingly interesting afternoon." I made no further effort to force his story, but moved with him down to where the ponies were tethered. Slowly the Major began to note his surroundings, and finally sat down on a stump, repeating his former remark, "I have had a most extraordinary afternoon." This time it was a prelude to a connected recital of the happenings of the afternoon:

"I was lying on my side, facing your direction, when a pebble rolled by me, coming from behind. I turned my head and looked into the face of our bear. He stood about 50yds. off, looking at me. I took careful aim at his neck and fired. He vanished behind a log. I was sure of my aim and felt that I had my bear. So sure was I that I circled around, scanning with my glasses every possible bit of near cover. No bear was ready to be skinned, so far as I could see. So finally I decided to close in, and bethought me that I must lower my sights for closer shooting. When I started to do so, I found that they were sighted at 300yds. I had of course overshot; but I dropped them nevertheless, and followed on in a forlorn hope of another glimpse. Not a sign, and I returned to my lookout almost blind with disgust. While still in this mood there appeared in the edge of the woods opposite another bear, followed by a second and a third—an old cinnamon and two cubs. Everything was forgotten in the new excitement. I drew on the old one and fired, a second, a third shot, before they cut for shelter. Each shot fell short and stirred the dirt under them." At this point the Major almost sobbed as he added: "I had left my sights at 50yds. and I was shooting nearer 300."

We waited in sympathetic silence for him to resume and tell us where he had buried the three shots still unaccounted for. He turned to me: "A few moments before you came out on the path you were following there appeared three of the scaredest bears that ever ate berries—again an old bear and cubs. She hesitated a moment, and then turned down the steep, wet bed of the half dry rivulet. Her cubs followed; none of them could keep their footing. In tandem style they half slid, half fell the 20ft. or so which brought them to secure footing. To keep them in view, I jumped a little hollow and emerged into full view. My rifle was at my shoulder before I found that the jar of the jump had loosened and jolted from its frame the right glass of my spectacles. My sighting eye could no longer tell a rifle sight from a cholera germ. My left eye witnessed and reported to me the progress of that flock of bears on to cover. I fired, of course, and possibly hit one of the Tetons. I shifted to use my left eye, and finally coaxed a cartridge to explode by a left-handed shot I felt as congenial to the attempt as John Milton might trying to write 'Peck's Bad Boy.'"

The Major confided to me at a later day that on the night following he had dreamed that his sleeping bag was a stock yard, occupied by some thousands of bears, whose skins he had contracted to turn into rugs. Not a bear could he catch or shoot, and he was awakened finally when on the point of being trampled to death under these 10,000 plantigrades.

Some sporting recollections grow vivid with time. Until I am afloat on the Styx I shall bear with me this unfading picture: An ardent sportsman, out of luck, sitting expectant and hopeful where possibly his fortune might turn. His chances fortified with field-glasses, eye-glasses, and three beaters carrying a Sioux war whoop. Then bombarded with bears, his pet game, as June bugs bombard a street light; fairly put to it to keep from under foot; the spectacle infused with a touch of vaudeville in the shape of an ursine ballet down a wet slide; he meantime seizing each chance to shoot, with sights just a bear behind, until at last, and after a half century of practice right-handed, he fights three bears with a left-handed rifle and a left handed eye-glass.

TWINKLE.

RECOLLECTIONS OF IOWA.—III.

"Work, feed thyself, to thine own powers appeal,
Nor whine out woes thine own right hand can heal."

LABOR'S pathfinders were these frontiersmen. May the blessings of a grateful nation forever rest upon them! The unwritten histoey of their toils and trials, their joys and sorrows, their disappointments and successess, would fill all hearts with admiration, sympathy and thankfulness; admiration for their courage, sympathy for their distresses, and thankfulness for the sacrifices they made for the generations to come. And yet, though unwritten, that history is not wholly lost. Like the Icelandic sagas, these tales are handed down from generation to generation, and let us hope that they will continue to be handed down as long as such examples "allure to brighter worlds, and lead the way."

"No age hath been, since nature first began
To work Jove's wonders, but hath left behind
Some deeds of praise for mirrors unto man."

And the deeds of praise left behind by the American frontiersman have done more in our nation's great school than all else combined to gain for our country the enviable position it now occupies in the great family of nations that controls the world and moulds its progress.

They taught themselves and their children to labor and love mankind. Energy, honor, integrity and purity of character were the indexes to their lives. While generous, they were exacting. To be a man or woman among them meant labor, labor, labor. While the men hunted and tilled the soil the women spun, and wove, and rocked the cradle. They worked in happy harmony, and in joyful chorus sang:

"We never know want, for we live by our labor,
And in it contentment and happiness find."

Old Pete was the best horse I ever knew. He was a powerfully built roan, full of energy, and was never known to balk. Pete laid the foundation of father's competency. He was there when I arrived, and for twenty years afterward. Father hauled flour from Oskaloosa, seventy-five or eighty miles down the Des Moines, to Sioux City, more than 100 miles west of us on the Missouri. He drove three horses, two on the wheel, and old Pete on the lead; and Ben Bennett used to tell some rather remarkable stories about father and old Pete. There were no roads to speak of, and there were innumerable bottomless swales and mudholes on father's route. As a natural consequence father was stuck most of the time. Ben said that he had watched father get out of these holes a good many times down on the Walnut Creek bottoms, where he lived. He said that when father found that he was stuck good and fast he would unhitch all the horses, put old Pete out on hard ground, tie a rope around his neck, run the rope back between Pete's legs and make it fast to the end of the wagon-tongue, and give Pete the word. Doubtless if Ben was telling the story in these days of the kodack, he would simply say that father touched the button and Pete did the rest.

Now while Ben was a good citizen, and a hard-working, industrious man, and with all due respect for his reputation for truth and veracity (which was not ordinarily regarded as the best), and his desire to pay a high compliment to Pete's energy and integrity, the undeniable facts were that when father got stuck he had to follow the good old plan of toting the flour out on his back, and reloading it after the empty wagon had been pulled out; and there is every reason for believing that if there had been any such thing in those days as a good roads club, father would have been a charter member. But time and toil did their work, and Pete became broken down, blind and helpless. Even then it was truly pitiful to see the old-time, unconquerable energy and ambition of Pete's nature manifest themselves. He would try to appear "just as young as he used to be," and hurt himself against the fence or shed. Father dug a grave up in the orchard, led poor old Pete into it, put his arms around his neck, bade him an affectionate farewell and shot him. When father turned away he remarked: "There lies the truest piece of horseflesh God ever made, peace to his ashes!" Of course we all felt as if some member of the family had died, but then that was a long time ago; and now old Pete, with all his good qualities, is only a fading memory,—and with the passing of the present generation even that will be forgotten. "We bury love, and forgetfulness grows over it like grass."

Of course father always carried his rifle with him on these long, lonesome trips. A pioneer without his rifle with him was not a pioneer. I have known them to even take their rifles to church with them. A pioneer and his rifle were as inseparable as is a Comanche Indian and his horse. You know that if a Comanche wants to go a mile on business he will ride if he has to go five miles to catch his horse.

Father would always stop to see us both going and coming on these trips. We were a kind of halfway house, and so he always kept us well provided with game, particularly venison, turkeys and chickens.

I did not appreciate then, neither can I find words to express now, the lonely, dark hours mother outlived during these trying days of the early frontier life. Left for days and even weeks without the protecting arm or comforting influence of her husband, with her father, mother, sisters and brothers beyond the plains and mountains, with two, and later three, four and five little children at her apron string, subject to all the infantile aches, pains and diseases, without medical assistance, without experience or sympathy—left alone "to watch and weep and pray for all." Then add the fact that the country was infested with Indians and ravenous wild animals, and mother's lot seems to have been hard indeed. Well do I remember the tears and sorrow that she tried in vain to hide. And so I feel constrained to say that the pioneer mother's love was—

"The love of many prayers and many tears,
Which changes not with dim declining years."

Panther Creek, a tributary of South 'Coon, just west of us a few miles, was the scene of many of my boyish hunting exploits. About all the trapping I ever did, too, was on this stream. It was the outlet of Pilot Lake in the northwest corner of the county, and was a favorite resort of otter and mink. Billy Ludington and I had a great deal of sport

there trapping, to say nothing of the good hunting we found. In the earlier days it was also a favorite resort of panthers and bears. It got its name from the comparative abundance of panthers, and I used to hear a great many yarns about encounters with these ferocious creatures along the banks of classic Panther Creek; but I think it was John Wright's experience with a panther out there that finally gave the name to the stream that still abides with it, and probably will even until the end of time. He, with his brother in-law, Green bury Coffin, were out on a hunt in that vicinity, and were strolling along through the tall grass and underbrush, when they suddenly came upon a very large she panther, which at once showed fight They were both brave men, fully accustomed to such dangers, and they at once appreciated the fact that their only hope was in boldness and caution. They were too close upon her when discovered to retreat, and they had to face the music or do worse. Wright in particular was a most fearless hunter, and delighted in close communion with fierce, wild animals—the closer and fiercer the better. He threw up his rifle, drew a bead on her eye and sent a bullet through her brain, and turning to Coffin, who had admonished him to "be careful," remarked: "I am always sure of my aim when I have to be." And I guess that John was about right, for he certainly was a remarkably cool and brave hunter.

Speaking of panthers reminds me of a little incident that occurred later on, after I had got out of knee breeches and felt big enough to go home with the girls. Uncle Billy Pitt and old Queen, his pointer bitch, had treed a panther over on the east side of the river, not far from our place, but the panther had unfortunately escaped and was terrorizing the whole neighborhood, killing calves, sheep, etc. Now it so happened that my best girl lived just a mile east of the river, and I had been bracing up pretty strong of late and seeing her home from church every Sunday night. There was undue hilarity and a provoking amount of winking and giggling among the other boys and girls after this panther story got a good start, and even mother and sisters smiled quietly, for it seemed to be the prevalent opinion that the panther business would in the end abbreviate a certain courting affair, and possibly break off entirely certain Sunday night promenades through the woods east of Adel. I myself had seriously considered the subject—had even laid awake of nights contemplating certain probabilities and possibilities. But I couldn't stand the nagging of my well-meaning friends, nor the snickers of my envious rivals; for I had claimed to be brave, and besides, Puss was the prettiest girl in the whole settlement, and there were plenty of boys ready to take advantage of any weakness on my part or discomfiture that fate might have in store for me.

Sunday night came, and with it church and Pussy. I was there. I had made up my mind to go home with Puss that night if it took the hair off. Puss too was brave, like all frontier girls, and gratifyingly willing, and I thought I observed a twinkle in her eye as we passed out of the door, when she saucily threw her head back and surveyed the observing throng. It was as if to say to them, "My fellow is all right and don't you forget it;" and I felt—or tried to feel—correspondingly brave and manly. And so we started on our jaunt with lights steps and brave hearts. At least I am quite sure that Pussy's heart was brave. It was a long tramp, and we didn't get to her home until 11 o'clock. I wanted to kiss her awfully bad that night, and felt that I was entitled to a kiss for my bravery; but someway I couldn't pucker up the courage to ask her. Honestly, I believe the dear little creature would not have objected that night if my bravery had manifested itself in the proper way.

Without the coveted kiss I bade her good night, turned away into the dark and struck out for home, whistling along (possibly to keep my courage up), with eyes and ears wide open and every nerve in its proper place and ready for duty. I hadn't gone far before I heard something pattering along in the brush near the trail, and my bravery seemed to be oozing out at the ends of my hair. I stopped and listened. It stopped. Then I walked faster, stopped suddenly and listened. It took a few steps after I stopped and then it again stopped. I heard it very plainly and saw, or imagined that I saw, two balls of fire peering at me from the adjacent brush. To say that I was scared is expressing it very modestly. I stooped down and picked up a couple of good-sized stones and proceeded on my way in fear and trembling. At last I came to 'Coon Hill, where, as I felt sure, the tragedy would be enacted, if at all.

The night was one of those proverbially dark nights when one "couldn't see their hand before them," and the intense darkness and stillness impressed me as being just the proper thing for such bloody work. Lord! but I was scared. If I could have got out of that scrape then with a whole hide I would have been willing to take a solemn oath that I would never go home with Pussy again, even if the boys and girls tied tin cans to my coat tail. But I was in for it and had to see it through whether I wanted to or not. I had nearly reached the bottom of the hill when I thought that I discovered a very dark spot in the middle of the road right in front of me. It hadn't been raining and I could not recall any wet spots on the hill, and I was in something of a quandary. I hesitated. I involuntarily stooped down and mechanically put out my hand—and put it right on to something warm and hairy. I had always been regarded as a pretty spry lad, and on this occasion my agility found ample opportunity to display itself. I leaped into the air, kicked with both feet simultaneously, fired both rocks at once and let a yell out of me that would have put an Apache to shame. Away went the other member of the conference howling with fright and pain, for my kicks had been well if not wisely placed and my other ammunition had not been expended in vain. Then I discovered that the object of my dread and unwarranted abuse was only a lost hound that had evidently been sizing me up and finally concluded to come out in the road and make a friend of me—only another example of the distressing consequences that too often result from misplaced confidence.

As I have stated, Panther Creek was the outlet of Pilot Lake, a prairie lake of considerable size in the northwest corner of the county. And some of my fondest recollections cluster about that lake. From a slight eminence near our ouse we could see away off to the northwest the top of a lonely tree. I had been told by hunters and trappers that it was the top of a large, solitary elm that grew on a small island out in the center of Pilot Lake, and after I had come into possession of the No. 14 muzzleloading shotgun mentioned in a preceding chapter I used to sit for hours on the hill and gaze wistfully at the top of that tree and wish that I was there.

One pleasant autumn day father and I took the wagon and went over on Miller's branch after a load of wood. The elms, cottonwoods, oaks and maples were shedding their leaves, the squirrels were gathering their crops of nuts, the Indian summer's sun smiled pleasantly down upon us, and all the sweet things in nature seemed to be conspiring to promote peace on earth and good will toward men, boys in particular. Even the sad leaves and yellow grass

"Whisper'd of peace, and truth, and friendliness unquell'd."

"So you want to go to Pilot Lake, do you?" said father, interrogatively.

"Yes, sir," I responded with spirit. I felt like saying "You bet,' but I knew full well that such an expression would not be calculated to improve my chances.

"Well," said father, "we will hurry things up a little and go next week."

I was very happy, and during the following week worked with a spirit that I had seldom manifested before.

Knowing, as I did in a degree, the wants and necessities of a camp on the prairies, I had everything in readiness when the auspicious day arrived. A covered wagon, a spanking span of bays, father's rifle, my shotgun, necessary ammunition, a few cooking utensils, some kindling wood and provisions, and two hopeful sportsmen constituted the outfit. Father was a nervous, pushing sort of a man, and when the wagon was comparatively empty he always drove on the dead run. I recall distinctly our departure from home on this occasion. I was sitting in the bottom of the wagon on some hay holding the guns, father was standing up in the front leaning far out pushing on the lines and putting the bud to the spirited horses, and the outfit fairly flew across the country, as if trying to escape from a wild prairie fire. We had but about twenty miles to drive to reach the lake, and we reached our destination quite early in the afternoon. As we drove up on the ridge that overlooked the lake a large eagle dropped out of the elm that grew on the little island out in the lake and slowly sailed away, creating much uneasiness among the water fowl in his line of flight. And talk about water fowl!

That was thirty-five years ago next November. I have hunted more or less ever since then all through the Northern and Northwestern States, but never since have I seen gathered together at one time and place so many or such great variety of water fowl. There were white cranes, swans, sandhill cranes, pelicans, brant, geese and ducks of every variety, and in such vast numbers as would seem incredible to the younger generation of sportsmen. After unhitching the horses and tying them at the feedbox behind the wagon, father fired a shot to start the game. Prior to this the air had fairly quivered with the movements of the restless birds, but now, as the shot rang out over the lake, there came a roar as of a mighty storm, and the sky was fairly darkened with their numbers.

As an evidence of their vast numbers, standing there in plain sight and in the broad light of day we killed quite a number before the flocks had passed out of range, armed as we were with muzzleloaders. I remember that father at one shot with his rifle brought down two white cranes, while I got three snow geese with a right and left. Then we went down by the lake and hid in the tall grass and shot until night shut down, and we had about all we could carry to the wagon. Of course, we did not use decoys. At that time I had never heard of such a thing as a decoy, and I doubt whether father had. That night as we lay under the wagon we talked of the prospects, which seemed bright indeed, and father seemed to enjoy the trip as much as I did.

Some time in the night father awoke me and I started up, chilled to the very bone. The wind had whipped around into the northwest and a November blizzard was upon us. For the balance of the night we walked to keep from freezing. The air was alive with birds going and coming, and their varied calls were incessant and confusing. Peep of day revealed a frozen lake surface, and the birds had in a measure vanished, having doubtless pulled out for warmer climes. It was awfully cold and disagreeable, and I was about as anxious to go home as I had been to come. And so ended my first trip to Pilot Lake; but I shall never, while I live, forget the sight that met our gaze when we first looked down upon the placid waters of this lonely prairie lake.

PORTLAND, Oregon.

Natural History.

INTERCOMMUNCATION OF ANIMALS.

LATONA, Wash.—*Editor Forest and Stream:* Mr. Ernest Seton Thompson has made some very interesting comments and drawn some very reasonable conclusions in regard to wolves, and as a hunter of them I wish to say he has described what every still-hunter has observed, not only among wolves, but among all of the lower tribes.

All animals, birds, bugs and fishes do, without doubt, have means of communicating intelligence not only to their own kind, but to others as well. Of that there can be no doubt in a hunter's mind.

All of the senses are undoubtedly used, but sight, smell and hearing are the principal ones.

Moose, deer, antelope, ducks, geese and many other species locate each other by a call, alarm their fellows by a call or a motion, have a war cry, another when in pain, and another when they are in trouble and need help.

This fact calls into being the birch bark horn for a moose call and makes it possible to make and sell duck calls, which a great many men use to make a noise with, not knowing that this little instrument will give the alarm note as well as the "good-feeding" note. Therefore, duck hunters, listen and learn to distinguish this peaceful note from all others, and then be sure you can imitate it, tone, inflection and all, if you would make the call of practical use

We all know how a bunch of Bob Whites scatter when flushed and we all know that they get together again soon if not disturbed. That is intercommunication. We also know that if one robin finds a good feeding ground he begins to whistle in a way that is not a simple song of gladness and that soon there are two robins, then a dozen there. That is another phase of the same thing.

Let a bluejay or a crow find an owl in some dark nook. Immediately there is a hue and cry raised by this one bird, and in a very few minutes there are numbers of his fellows on the wing, hurrying to get there in time to help fight that owl. The cry is plainly a battle call, and every bird that hears it knows there is going to be a fight just as soon as the numbers warrant it. That is intercommunication and with a vengeance.

Yet let the bluejay or the crow discover anything that means danger, as plainly as the sight of a man with a gun, for instance. Again the screams and racket as he hurries away and everyone of his fellows likewise places distance behind him without stopping to question the cause of the alarm calls. He knows from the sound that whatever his friend sees is dangerous to him and a good thing to get away from. So does the squirrel among the leaves hunting hazelnuts, and he scurries up a gnarled oak and peeps down, silent until he knows the danger is past. All other birds hear the same alarm and skip into darkening thickets, where they are better hid. A rabbit, out for an early nip of vegetation, hears the call and nips no more, but pops into a convenient brush heap for cover. The bluejay has told them all to hide.

Now let the hunter stop and remain perfectly quiet, making neither sound nor alarming motion. Soon the squirrel slips down, and begins his work of hunting and "cacheing" nuts again. One by one birds begin to hunt their food and twitter softly to each other, the bluejay slips back among the branches, talking to himself, and fairly puffed up with curiosity and importance.

These are only a few instances of the intercommunication that everyone who goes into the woods and observes his surroundings knows without doubt takes place daily.

Of course, different species have their own way of getting at these results, but they all communicate more or less with their own kind and with others; and wolves have become very proficient, because they must be so or die by the hand of man. EL COMANCHO.

THE ANTELOPE IN MONTANA.

FORT ASSINABOINE, Mont., Feb 17.—*Editor Forest and Stream:* From a recent conversation with James Parotti, the game warden for this (Choteau) county, I gathered a few facts which may be useful to you in your work on the distribution of antelope. He is, of course, familiar with the distribution of game in this county, but is also well informed as to its abundance throughout the State generally. He informs me that antelope can be found at the following points during the entire year, besides which a good many—according to the severity of the weather—move in from Canada every fall:

Rocky Springs, near the Canada line—Many small herds.

Sweetgrass Hills—Large numbers of antelope.

Antelope Springs, south of Bear Paw Mountains, near Cow Creek—150 to 200 head.

Landusky P. O , south of Little Rockies—Plentiful.

Sage Creek, twenty-five miles from Havre, west—Several small bunches.

Milk River, twenty-five miles from Havre, west—Several small bunches.

North of Chinook, about twenty miles—A number of small bunches.

Old-man-on-his-back Butte, thirty-eight miles northeast—Large bands.

Old Benton and McLeod trail—Scattered bunches anywhere.

Augusta, on South Fork of Sun River—Scattered bands.

Poplar Agency, Fort P. ck Reservation—Fairly plenty.

Southeast of old Fort Claggett, on Missouri—Plenty.

Musselshell county—Plenty.

Between the Musselshell and Billings—Plenty.

Antelope Hill, near Blackfoot, Deer Lodge county—A few. This is west of the Rockies.

Lower Yellowstone—Scattered bunches.

North of Havre thirty miles, on Willow and Battle creeks—Plenty.

North of Glasgow—Scattered bunches.

Mr. Parotti has been in this country as hunter and guide for nearly twenty years. He tells me that the fearful winter of 1893, when the thermometer registered 61° below in this post, killed off four-fifths of the antelope—that they starved to death by thousands on account of the deep snow. He found, after that winter, what he estimated were 900 carcasses where the antelope had drifted into a deep ravine and evidently had no strength to get out. Before that time antelope were plenty through here, but that winter killed nearly all off. While they were shot by thousands, the number so destroyed was only an insignificant fraction of the total. He tells me that these antelope, like those which drifted in this winter, probably came from the Red Deer River country, 250 miles to the north of here. He has hunted in that country, and reports antelope there in immense bands, the country unsettled, and few to molest the game. He believes that a large majority of the antelope now in Montana during the winters drift in from across the Canadian line. EDWARD L. MUNSON.

NORTH CAROLINA BIRD NOTES.

I AM spending the month of March in the suburbs of Asheville, N. C., a fact of no consequence whatever, except so far as it gives me an opportunity to speak about the birds I have seen here.

During the last week in February the weather was very cold and windy. Ice formed every night and once snow fell. On the 27th an immense flight of robins appeared and large numbers were shot. We at the North feed them on cherries, strawberries, etc., for our Southern brethren to shoot and feast on. There are thousands of robins now all along the banks of the Swannanoa River, which flows through Biltmore, George W. Vanderbilt's vast estate of 100,000 acres. They are on their journey northward.

Yesterday I saw a flock of crow blackbirds (purple grackles), and to-day a flock of redwing blackbirds, going north.

On Sunday the cackle of a flicker (*kee yer! kee-yer!*) sounded from the tall trees somewhere near the house, and while trying to get my eye on him I noticed a pair of yellow-bellied sapsuckers. A common bird here is the little white breasted nuthatch, which runs up and down the trunks of trees in close proximity to the house, apparently fearless of human beings It is found in company with the lively little chickadee, whose saucy investigations are pushed to the utmost limits of familiarity. Two species of the chickadee are found here, *Parus atricapillus* and *P carolinensis*, the latter being smaller, but not otherwise differing noticeably except in its call notes.

In my rambles in the neighborhood I have observed such birds, common to the North, as the crow, bluejay, bluebird, junco or snow bird, American goldfinch or yellowbird, cardinal grosbeak, chippy, song sparrow and field sparrow, whose liquid notes are so inimitable. But by far the most interesting bird to me is the tufted titmouse, an active little blue-gray, 6in. rascal, who is afraid of nobody, and spends one-half his time by day in seeking food and the other half in telling you so in Latin from the highest tree tops. At

first his shrill *peto, peto, peto* is rather musical and pleasant. After having heard it for ten minutes or so it becomes a trifle monotonous, and at the end of a half hour you wish you had a gun. Two hours afterward, coming back that way, you are likely to hear the same bird doing the same thing with a pertinacity that would be admirable if the results were marked by some variety.

The month of March so far has not been favorable for ornithological research. Rain has fallen about every other day or night. The woods are wet. The roads are simply awful; and the feathered host in Florida and Georgia, except the robins and the blackbirds, seem to be content to bear the ills they have rather than fly to others that they know not of, unless perhaps by instinct or experience.

J. L. KEARNY.

FOREST HILL, Asheville, N. C., March 18.

WILD BIRDS AT THE SPORTSMEN'S SHOW.

To many visitors to the Sportsmen's Exposition the most interesting thing there was the exhibit of live wild birds sent by Mr. Treadwell, of Long Island, and Mr. Verner de Guise, of Mahwah, New Jersey. As many of these birds were of kinds unfamiliar to many sportsmen, they were examined with the greatest curiosity and interest.

The wildfowl shown by Mr. Treadwell included two coops each of brant, of Canada geese, of snow geese, and of Egyptian geese; one each of blue geese, Hutchins geese, black ducks, mallards, white call ducks and Cayuga ducks, these last being varieties of the domestic duck. Mr. De Guise showed several coops containing a large number of pheasants, both the ring-necked and the old-fashioned English pheasant (*P. colchicus*), together with a coop of prairie chickens—pinnated grouse.

The admirable condition of the birds shown was remarked on by all who saw them. Their plumage was as smooth and bright as that of wild birds, and the wildfowl were very tame and showed no uneasiness or alarm when closely inspected. This was hardly the case with the gallinaceous birds, which we may suppose to be less accustomed to confinement in small inclosures. Some of the ring-necked pheasants strove to push their way through the wire netting at the back of the cages, and for a time the pinnated grouse tried to get out. As soon as cloth was placed over the wire at the back of the coops these efforts ceased. It is certainly an interesting thing that there are in this country two large establishments like those of Messrs. Treadwell and De Guise, where wildfowl and gallinaceous birds are bred successfully. This and the effort made by many wealthy men to establish large game preserves are tendencies of the present day in America which are very suggestive.

Intimation of Spring in Texas.

PETTY, Texas, March 12.—The black martin (the harbingers of spring) are here; I noticed two on Feb. 23. There was a wind and rain storm on the night of the 21st, and early on the morning of the 22d I heard the familiar note of these welcome little companions and saw a couple of them circling about their last year's residence, as if to see that all was well before taking possession of their summer home.

The wildfowl have begun their northward journey: a great many wild geese, brant, etc., passed here this week.

The red-breast robin has been with us in goodly numbers during the last few days, but they seem to be possessed of a restless spirit. They do not remain here in summer. The season when Bob White will have the cloak of the law thrown around him is near at hand, and I will rejoice to see it come.

F. E. W.

Papers on Tropical Mammals.

Two papers by Dr. J. A. Allen, of the American Museum of Natural History, just received, treat of collections of mammals made in Costa Rica and in Mexico. The first represents material a large part of which has been contributed to the American Museum either by Messrs. Alfaro and Cherrie personally, or by the Costa Rica Museum. The material consists of about 300 specimens, and represents sixty-five species. Besides this additional material has been received recently. The present paper enumerates sixty-six species of animals, of which seven species and one genus are new.

The second collection, Dr Bullers's collection of Mexican mammals, numbers over 300 specimens, and represents fifty-five species, of which sixteen were determined as new to science.

Birds and Locomotive.

A FORT COLLINS, Col., press dispatch recently reported that as the Denver passenger train was coming from Loveland last evening in the midst of a big snowstorm and fog, the locomotive enccuntered a drove of snowbirds which drove at the headlight with such violence that the glass guard was broken and the light extinguished, and the train came from Russell Creek to Fort Collins in darkness. The birds were killed by the score by striking the cab and pilot, and fell into the engine and tender and floor of the cab, falling so thickly that the fireman scooped them up with his shovel and threw them out. When this place was reached at least 100 dead birds were taken from the locomotive and tender.

Snake and Hawk.

THOMASVILLE, Ga., March 15.—A few days ago Dr. Hodgeman, of New York, and two friends were out shooting quail. While eating lunch they saw two hawks sailing well above their heads. One of the gentlemen said, "I am going to take a shot at the lazy one." He did so, and the hawk sailed on. A short time after, something fluttered to the ground near them. On going to the spot they found a hawk with a small snake tightly wound around the hawk's neck and the lower jaw of the snake set in the body of the hawk.

After killing the snake in order to release the hawk, they killed the hawk because every hunter does. SAYVILLE.

New York Game Laws.

ALBANY, March 20.—The Governor has signed Assemblyman Hobbie's bill prohibiting the hounding of deer for ten years in the towns of Dresden and Putnam, in Washington county.

Also Assemblyman Post's, allowing the shooting of web-footed wildfowl from floating devices, boats propelled by hand and sail boats, in Long Island Sound, Great South Bay, Gardiner, Shinnecock and Peconic bays.

Game Bag and Gun.

HOURS IN A BLIND.—III.

A Windward Point.

THE desirable wind for point-shooting is one quartering from behind the gunner. This gives the birds abundant room to swing over the water and to come up to the decoys, offering a good shot to the man in the blind. Sometimes, however, it happens that after one has tied out with the wind just right and everything apparently favorable, the wind will haul more and more in front of him, or may shift suddenly, so that it blows directly on the point and in the gunner's face. One result of this is that his decoys, instead of riding in a long line head to tail, swing around and now sit in the water side by side, their bills of course facing the wind. Worse than this is the fact that the fowl which come in can no longer swing over the water, but if they wish to alight to the decoys must swing over a marsh and come from behind the gunner and so over his blind. Thus they are quite certain to see him, or at least some of the strange objects that he has brought into the marsh; or if they do not see him, at least they come from behind him, and he is obliged to twist around and shoot at them when they are coming toward him and nearly over his head. For most men, I think, shooting of this sort is very difficult, and usually when such a shift of wind takes place it is better for the gunner to take up and to move—if such a course is practicable—to some other point, where the wind is right.

One of the chief difficulties that I find in shooting at birds that come in from behind the blind is that a large proportion of them come quite low, and so are not seen until they are almost upon the gunner. By the time he gets his gun to his shoulder the bird is likely to be almost within arm's length If now it flares and goes directly up in the air the shot becomes an easy one; but if, on the other hand, it keeps on over the gunner's head he has to twist around and is very likely to shoot hastily at a straightaway, swift-flying bird and to miss it.

I have never yet shot in a blind with a remarkably good shot—a man who took all chances and killed a very large proportion of his birds. I know that there are such men, but it has never been my fortune to see one of them shooting wildfowl.

Sometimes a bunch of birds coming low over the marsh at a tremendous rate of speed unseen may pass over a man's head with a sound which resembles the escape of steam from a large locomotive, and which, coming so unexpectedly, has a tendency to frighten one out of several years' growth. In my limited experience, canvasbacks and blackheads are the worst offenders in this respect, though occasionally an old black duck coming low down over the blind will startle one by the rustling of his feathers. On several occasions I have had a white headed eagle come so near the blind that when I rose and shouted at him I could plainly hear his feathers creaking against each other as he threw himself over nearly on his back, and scrambled through the air to get way.

Passers-by.

It surprises one, though, of course, it is only natural, to see how many birds there are, which are not wildfowl, that come close to the blind entirely unsuspicious of its occupant. Hawks and sometimes, during gray days, owls hunt over the marsh, eager to prey on the blackbirds and sparrows whose haunt is here. Gulls often pass near the decoys, and occasionally one sees flying through the air a loon or a cormorant. Sometimes one of the latter may be seen perched over the water on a stake of some deserted bush blind. Eagles and buzzards, of course, and the ever-present crow, are constantly searching over the marsh and over the water, looking for dead and wounded ducks.

From the many ducks and geese that are so lost to the gunner the eagles and the buzzards no doubt gain a fat livelihood, and the clean-picked skeletons of wildfowl surrounded by the feathers are frequently seen in the marshes.

Besides these, in and among the reeds live blackbirds, sparrows, marsh wrens and rails, any of which will venture close to the blind. Sometimes a little Carolina rail in its peregrinations along the water's edge will even walk into the blind, and gaze at its occupant with bright, dark eye, uncertain what he may be. It is amusing sometimes to see two or three men and a dog go crashing through the cane in hot pursuit of one of these little birds, who must laugh to himself at the clumsy efforts made by his pursuers to capture him.

Often a little whisp of snipe of two or three individuals pass within gunshot of the blind, or a single bird, like a bullet from the sky, may drop on some nearby point of the marsh, and run briskly about over the mud at the water's edge, probing with busy bill for food which is hidden beneath. In like manner now and then a killdeer plover or a pair of yellow-legs may fly in from beyond the marsh, and hurry along over the mud as if greatly pressed for time.

Herons, of course, are abundant in the marsh, and are of three sorts The night heron—in New England called quawk—and the bittern are seen less often here than the great blue heron, which in these parts is known by an apparently unmeaning name—"forty gallons of soup." This bird is common here, and often comes close over the blind or alights in the water near it.

It is interesting to watch one when it is fishing. Its huge wings and long straddling legs make a great commotion over the water when it alights, though there is no splash when it puts its feet down. The moment that it has folded its wings, however, it straightens its legs, neck and body, and for a long time stands bolt upright, absolutely motionless, looking for all the world like a straight, weathered stick standing out of the water. In this position it resembles anything rather than a bird, and its attitude is extremely ungraceful. The position and the entire absence of motion are due, I suppose, first to its desire to see whether any enemy is in the neighborhood; and second to give its prey, which may have been frightened by the shadow of its passing body, time to recover from this alarm.

After a period of stillness which may last five or six minutes, but seems to the watcher much longer, the heron, still holding its neck straight and stiff and its bill pointed somewhat upward, takes a cautious step and then stands still for a moment. Then, seemingly reassured, it moves on with slow, careful steps, its head turned a little on one side, evidently searching the water for its food. It does not take the conventional heron attitude until it sees some little fish that is within reach. Then very slowly it draws in its neck and darts out its strong, keen bill, and usually captures its prey; not always, however, for I have several times seen one miss his stroke.

These are big birds, and birds too that one seldom has an opportunity to kill, yet it always seems to me a pity to shoot at them. They can be eaten, to be sure; yet no one who has ducks and geese to eat would be likely to prefer heron. Unless the gunner has some use for it, it does not, to me, seem worth while to kill any bird. Life is something so mysterious that it should not be lightly destroyed, and I have no sympathy with the wantonness which leads many shooters to try their guns on every robin, swallow, nighthawk or bat that may fly near to them. This is commonly done "for fun," or to see "whether I can hit it;" but it is all wrong.

Strangers from Afar.

Besides the birds of all sorts of which I have spoken, and the water fowl, which are so conspicuous, and of which the lucky gunner secures a few, there are killed here occasionally birds that are altogether unexpected.

One of the most unusual of these was secured some years ago by a local gunner, who of course did not know what it was, but shot it because it looked so strange. This was a dovekie, or little auk, a bird of the arctic regions, which is said to breed in Greenland, and which occurs in small numbers in winter off all the North Atlantic States. It is rarely seen south of New York, and for all I know its North Carolina occurrence may be a record.

The white brant, or snow goose, is found here every year in small numbers, one large flock living on the outer beach not very far from the Currituck Lighthouse. These birds do not seem to associate with the common gray geese, but keep by themselves, and feed largely on the marsh instead of in the water. Sometimes I have sailed within gunshot of this flock of 500, and their white heads appearing over the short marsh grass, which hides their bodies, have a very curious appearance. When fairly alarmed, they spring into the air and fly away with sharp, cackling cries, much less musical than those of the common Canada geese. They are seldom killed, I believe.

Now and then among the birds brought in by the gunners will be seen a curious duck, unlike anything known here, and which the ornithologist at once recognizes as a hybrid—something which is not very uncommon among the duck family. I have killed a male hybrid which was manifestly a cross between a mallard and the pintail, and have seen more than one hybrid between the black duck and mallard.

I have heard of two or three strangers from Europe having been killed in these waters. These were English widgeons, usually found associated with the American bird and recognized as something strange only after they had been killed and retrieved.

The Hairy Crown.

An abundant bird on the waters of Currituck Sound is that locally known as the hairy crown. This is the bird called in the books the hooded merganser. I have never seen these birds so abundant anywhere as they are here, and flocks of from 75 to 100 are sometimes seen. More often, however, the companies are much smaller.

If you see these birds coming a good way off, they will very likely fool you by their manner of flight, and you will at first say "Blackheads," and then "No, canvasbacks." Perhaps it will not be until they are almost within gunshot that you disappointedly exclaim: "Hairy crowns." These birds, though commonly they do not pay much attention to the decoys come up without the least hesitation if they make up their minds to come, and alight in the water, swimming about with lowered crest and diving for food, quite unconscious that the decoys are shams. If you stand up in your blind and raise your gun they erect the crest in token of suspicion, and then may dive and swim under the water for a long way, or perhaps jump up and offer you a shot. It is only their swift flight that makes them hard to hit, for they fly very steadily. Sometimes, when a little flock is flying across at a distance, they can be called to the decoys by an imitation of their note, which is something like that of the blackhead—a guttural, grating croak.

The male hairy crown is a beautiful bird, with his elaborate livery of black, white, tan and delicate gray, but as hairy crowns are commonly regarded as worthless for eating, they are often allowed to pass unharmed by the gunner unless he is shooting for count, when he will try to knock down those that come to him, as each one retrieved counts as a duck.

The redbreasted merganser is much less common here than the hooded, but occasionally drops in among the decoys. Its local name is sawbill. The goosander I have never seen here, nor do the men with whom I have talked about it appear to know the bird.

Calling Down a Goose.

During much of the day the music and clamor of the geese, softened by distance, fall upon the gunner's ear. It may be that in some channel not far from him great numbers of these birds are resting on the water talking to each other, and often flocks of traveling birds pass up and down the Sound, calling to each other or answering the salutations of other birds at rest. Often too a sailboat, passing through a great raft of geese, will put all the birds on the wing, and they rise in a thick cloud of dark specks against the sky, looking like a swarm of bees. When these birds have been so disturbed they often break up into small companies and fly here and there in different directions, seeking new resting places.

The man who sits all day in his blind is likely to have some of these moving flocks of geese pass near him, and sometimes they may fly so close that he will have an opportunity to shoot into them, and to pick a bird or two down from the sky. If he has a couple of goose decoys in the water, and if his boatman is a good caller, his chance for a shot is, of course, much better. It is extremely interesting to see the boatman call down a goose and to watch the actions of the deluded bird as it swings lower and lower in wide circles, and at length, with outstretched neck and hanging feet, comes up over the decoys to join its supposed comrades at their head. When the bird is distant the men fairly shriek out their calls, but as it gets nearer and nearer their voices are lowered, their heads are bent toward the earth, perhaps they place their hands or their hats in front of their mouths. The conversations which they hold with each other and with the goose are no longer shrill and loud-voiced *honks*, but are chuckling confidences which the supposed geese on the water are sharing with one another. The incoming bird still calls with loud, sonorous tones, as if anxious to attract the attention of the wooden decoys, but as he gets nearer and nearer the talk of the men becomes still lower, until at last, when the gunner jumps to his feet and levels his arm, it ceases altogether.

Let no one imagine that because the goose is a great bird nearly 4ft. long and apparently of slow and unwieldy flight it is a matter of course that he will kill him. I confidently assert that there is nearly as much room in the air around a goose as there is around a duck, and unless your gun is carefully held you will shoot behind the bird. If you miss him with your first barrel you are very likely to miss him also with the second, which is likely to be fired with undue haste. If, however, your first barrel has done the work, and he falls to the water, your boatman is certain to offer you cordial congratulations which will warm the cockles of your heart.

Often it may happen that, while the goose does not come down to the decoys, he will alter his flight and pass over the blind within long range. In such a case your shot may perhaps fail to break any bone and yet may mortally wound the bird, which, after making a wide circuit or a long flight, will at last come to the water stone dead. COUPLES.

[TO BE CONTINUED.]

LIFE AMONG THE LUMBERMEN.—II.

(Continued from page 226.)

ASHLAND, Wis.—As usual, Ernest was awake first in the morning, and came over to my bunk, which I had built separate in the far corner of the camp. He struck a match and lighted the candle, stuck it in the hole bored in a protruding log at the head for a candlestick, the sizzling of the match starting me broad awake.

"Well, Ernest, how's the weather; snowing yet?"

"You bet he snow. He keep on leetle longer he bury the camp. I make snowshoe to-day out of deer hide we get yesterday, so we can go after more. Snow too deep for walk; teenk have to make snowshoe for sled for haul log and snowshoe for horse hox."

By the time Ernest had finished this speech I had dressed sufficient for investigation. I could barely open

"AN OMINOUS GROWL, DEEP AND ANGRY."

the door far enough to squeeze out, so great a weight of snow was there against it. I turned my face upward and felt the flakes fall, soft and silent as down. It had changed from the hard pellets of the day before and added to the depth faster than ever. The temperature had grown much warmer during the night, and I remember that as I stood there with the snow to my hips and falling steadily on my upturned face, there crept over me a sense of security and comfort, and to this day I cannot look out on a fresh fallen snow without something of the same feeling. Most people, I am aware, are wont to regard the snow as the winding sheet of earth and associate it in their minds with the cheerless things of life. To me it is a wonderful blanket, soft and warm, to cover the sleeping earth, coming and growing, like the fur on her creatures, when she needs it, and keeping safe the germ of life in green to bloom against her awakening.

But what is to be the outcome of this affair? was my next thought. A new sense of responsibility came over me. I was "in charge." To me the crew would look for the conduct of affairs until the return of the boss. It was apparent now that the storm was something serious, and that the arrival of the tote team was likely to be delayed considerably longer than expected. The main thing, I judged, was to provide food, if possible, and keep the men until the roads were open and we could get into thick timber and finish our winter's work. Luckily for me, I had able counsellors in Ernest and the cook; and besides I was only turned nineteen years of age. At that time of life most of us are pretty apt under difficulties to alight, like the proverbial cat, "on our feet." So, feeling as though the matter was not so very serious, I got back into camp, and finding the cook up we held a council.

It was decided first that we should devote our energies that day to making snowshoes, in order that we might get abroad, and if necessary get down the river if grub was likely to fail and no supplies reached us. Accordingly the crew was routed up and each man was instructed to make some sort of vehicle for snow transportation. Kronquist started in on *skis*, and the rest of the crew, with the exception of Ernest, followed his lead. It was tough work getting the material, although plenty was at hand within a few rods; but, as Ernest put it, "we have to swim" in order to get anywhere.

Toward evening Ernest, with my help, had completed two pairs of serviceable rawhide snowshoes, and we started up the logging road to see what we might see. Only a faint depression showed where the road had been. A short way from camp we came to where a band of three deer had crossed, and the snow was so deep they left a trail which looked as though small saw logs had been dragged along the surface. It was growing dusk, and as it was extremely exhausting work to make headway even on snowshoes, we were about to turn back, when something attracted Ernest's attention. He was a few steps in the lead, and I saw him stop, pull off his mitten, and hold his gun ready, looking intently off to the right. I shuffled silently up and whispered, "What is it?"

"Something ump. Don't know what. We go see.

A few more steps and we caught sight of an animal making as good time as possible through the soft snow. A few strides, a tap on the nose with the poll of the ax and a dead porcupine lay stretched out for our inspection.

"Him all right," said Ernest, "he good for eat like pork. I cook him. You see."

"But what's this?" I say. "Something has been afoul of our porky; his neck is all chewed up and that is why we caught him. What could it be?"

Ernest took one look, and without making any reply started on the back track of the porcupine. I cut a slit in the throat, cut a crotched blue beech one branch short and sharpened, which I jabbed in between the lower jaws, and dragging the carcass started after. I came up with Ernest under a huge birch, his gaze directed first among the branches, next to the ground underneath.

"You see, de porky feed here. You see where he peel the bark and eat the bud. Then you look here you see where something try to eat *him*."

There was a trail from here which we took up and followed. It led us in a roundabout way to the roots of a huge fallen pine and into a hole which seemed to extend into the body of the tree. Ernest walked the length of the trunk, came back and said: "I think it be the dev'. He in there; he can't get out only here; no hole in de top. You take off your snowshoe, get on top and pound along the tree. If he come out I shoot him."

I did as requested, and hammering along the trunk was startled when about 30ft. from the root to hear an ominous growl, deep and angry, and seeming to issue from some hidden place deep in the ground.

"Well, Ernest," I cried, "if it is the devil, as you say, he must be a big one; he certainly has voice enough for an elephant."

Ernest replied in a tone of voice which instantly commanded my attention, "You hustle back here, cut de lil pine quick, stick him in hole. We have to go for camp. You know where de road be?"

I understood in an instant. It was nearly dark. After following the trails to the fallen pine I could not tell, to save my life, in which direction the road lay. Neither could Ernest. Our only chance was to take the back track and take it soon. I quickly had the small pine down, and logging it into three sections we jammed them into the hole as tight as we could and started for the logging road. I know not if I should ever have reached it alone, but Ernest proved a sure guide and led me safely out. Once on the road, Ernest delivered himself: "I not sure dat de dev', but I t'ink he be dat. He try eat de porky. No bear, no wolf try dat. We see to-morrow. If we stay to get him to-night we have to stay until morning. Better we go camp, sleep, come back early, he all right. He no get away."

Night had completely fallen now, and we settled down to a steady swing, making as good time as possible, but finding it slow, hard work. All at once as I turned to look at Ernest I saw frost on his long black mustache and said to him: "It's growing cold. Feel the frost on your whiskers?"

"Dat so. Now he stop snow pretty quick." He stuck his forefinger in his mouth and held it up over his head to catch the direction of the wind. "The wind from north now," he said. "He grow cold fas' the snow he stop."

We soon had evidence that a change was truly at hand. The storm thus far had been accompanied by little or no wind, and the silence of it I cannot describe. It was simply absolute, intense, oppressive. But now there ranged first through the forest a mighty sigh, then each tree and shrub seemed to shiver from its topmost branch to its root, and a deluge of snow plumped down from above to be swallowed up in the ocean of snow beneath; then the pine tops started the music and soon the whole woods orchestra was in full play, the music growing in volume as the wind rose.

Getting back to camp, we found a game of poker in full blast, and a little black Frenchman had won nearly all the tobacco in the wangan. The cards were put away for supper, and were not brought out again. The boss would not allow them to be played in camp, and I considered it my duty to administer affairs as nearly as might be as they would be if he were present. After supper Ernest skinned and dressed the porcupine, and the cook brought out his guitar, while a young Swede produced an old violin, mellow and sweet of tone; and striking up a lively tune we soon had a quadrille formed, and danced the blues and discontent out of the camp.

When 9 o'clock came I went outside and found that the storm had ceased, the stars were shining, the trees were singing in the north wind, and the frost nipped hungrily at my ears. As I stretched out in my bunk and lighted the candle to read for a few moments before sleep overcame me, my thoughts returned to the animal we had left imprisoned in the hollow pine, and it gave a zest to the anticipations for the morrow G. W. M.

[TO BE CONTINUED.]

WILD GOATS IN THE ROCKIES.

WHILE the buffalo have disappeared and the elk are getting scarce, there are still lots of wild goats in the main range of the Rockies; also in the Selkirk and Cabinet ranges, which form a sort of stepping-stone to the western slope of the Rocky Mountains and give to northern Idaho, western Montana and southern British Columbia its grand scenery.

There are several reasons why the goat is not hunted so very much, chiefly because the savage hunter thinks that it is too much like work to hunt for goats on a lofty mountain; it is so much easier for the tenderfoot, fresh from the city, to hire a man to show him something to shoot where he does not have to climb mountains.

The head of a wild goat properly mounted makes a very satisfactory trophy, the slender black horns curving backward very prettily; the hide makes a very tasteful rug; the hair is very long and snow white.

As a general rule wild goat meat is very poor eating, being tough and rather strong; a young kid, however, is fair food. The proper time to hunt the wild goat is in the early spring, fall, or, if you like hard work, follow them up the mountains in winter. If you shoot a goat then you get a prime hide and good horns.

To return to a hunt I once indulged in with my old friend Col. Wroug.

We pushed up to Fort Steele, British Columbia (which is a small town of possibly 100 inhabitants lying at the very foot of the Rockies), from Borum's Ferry, Idaho, by way of the old Moyra Trail, a distance of 125 miles through the mountains; the scenery along this trail is superb. At night we camped on the banks of the Moyra River, a beautiful mountain stream about 160 miles long. Trout abound in this river. I have known four men to catch 900 in three days.

Our outfit consisted of a saddle and pack horse apiece. Besides six-shooters, the Colonel carried a .40-65 Winchester, and I carried a .45-70 Winchester; we also took a good dog apiece.

Arriving in four days and a half at Fort Steele, we camped there a day to report at the Canadian custom office and to lay in a fresh supply of grub.

The next day we struck down the Tootenai River to Bull River, twenty miles north, crossing this stream at the old pack bridge, which spans the river at the falls (which are grand, the water tumbling almost 90ft. straight down). We continued on up Bull River, crossing Iron Creek at its mouth, about five miles above Bull River Falls. Here we came to the end of the trail; however, we continued on up Bull River twelve miles further till we found good feed for our horses, and there we made our permanent camp.

All this sounds very easy, but as a matter of fact it was very hard work after we left the end of the trail; we were almost three days making the twelve miles. We had to use our axe all day in order to get our horses through the fallen timber. We forded Bull River whenever we could in order to save work with the axe, but we could not do it very often, as the river is very swift, and the probable loss of a pack horse with our blankets and grub was a little too serious a matter for us.

On our way up we found lots of bear sign, and big fellows too, judging by their tracks. The Colonel saw one black bear the day before we reached our final camp. The day we arrived at our destination, after fixing up camp and hoppling the horses so that they could not leave us, the Colonel went back about half a mile on our trail, where we had noticed a big log jam in Bull River, to try and get a mess of trout for supper. I took my rifle and dog up the mountain back of camp to look for signs of goat, and hoping to get a grouse or so for food.

Going about quarter of the way up and then around the side of the mountain, I came to what I should judge was a good-sized creek in the spring time, but now it was almost dry, here and there 15 or 20ft. of water. This creek lay below me and south, dividing the mountain I was on from the next one. Going down the mountain to this creek, I found to my surprise that these little pools of water were alive with trout, which had evidently been caught there as the water went. Going to one end of one of these pools, I drove the fish up to the other, and then told my dog to catch them, which he did by grabbing them in the shallow water and throwing them out on the gravel. At this novel way of fishing it only took a very few minutes to have a good mess, which I strung on a stick and lay on my trail to take on my way back. I then proceeded up the creek bottom.

I had not gone more than a quarter of a mile when I noticed a goat trail. It was a very old one, probably one that they had used for years coming down to water. On examination, I found that their hoofs had actually worn a trail in the solid rock almost 2in. deep.

I looked around carefully to see if there were any goats still using the trail, and to my joy I found that there had been some there very lately.

This was all I wanted to know that day, so I hastily retraced my steps back to camp, picking up my fish on the way. My dog found three grouse for me on the mountain. I promptly shot their heads off, as the heavy bullet from my rifle would have torn the bodies all to pieces.

As I had my rifle and eight trout to carry, I gave the birds to my dog to bring in, and struck camp just in time to escape building a fire, for according to camp law the first man in camp builds the fire.

The Colonel had succeeded in landing thirty-three trout in an hour and a quarter, but he could not see how I had caught mine without a hook or line.

Around the camp-fire that night we discussed our plans for the next day. We decided to get an early start the next morning and follow up the goat trail that I had found. Waking up a little before daylight the next morning, I quickly rolled out of my blankets and we soon had breakfast. Shortly after daybreak we were on the move. At first we walked pretty rapidly, but when we were near the goat trail we moved along more carefully; arriving there, we made an examination of the tracks at the foot of the trail and found that there had been some goats there since my visit the night before.

The tracks ran up the rock trail to the south, so that after making sure that our guns were all right we started on up the trail, which was very steep, so much so that we had to use our hands climbing up. Upon our arriving at the top the trail became very dim; however, we pushed on, the country being very rough and rocky, with almost no vegetation in sight. Soon we halted at the foot of a poin

of rocks about 50ft. higher than the rest of the country, and while my companion remained where he was I went up to take a look around. Peeping carefully over the top, I saw at not more than 100yds. from me five goats, three lying down and two standing; one of the two that was standing was an old "billy;" he was evidently on the watch. I quietly withdrew my head and motioned to the Colonel to come up quietly. After he had had a peep we held a consultation, with the result that I should shoot the old "billy" while he shot the other one that was standing.

We were to shoot the first round concealed, and then stand up and cut down the rest if possible.

The first part of our plan worked to perfection, for we shot the two standing dead the first shot, both bullets finding a heart. The remaining three goats quickly jumped up and started running, first one way and then the other. My companion and I each crippled one, but the third goat made good his escape. We each took after a wounded goat; both of them were quickly out of sight, the country being so rough. Our dogs then came into use. My dog held the track well, and in about a quarter of a mile I jumped my goat and had the satisfaction of knocking him over while on the run. The Colonel was as successful as I, although he had to go further before he could get a shot.

It took us just an hour to take the heads and hides off.

Thinking that was enough for one day, we struck back to camp.

We camped there four days, and in that time got thirteen goats. We would liked to have stayed longer and had a shot at a grizzly bear; but it was almost time for snow, and we were about 100 miles from home. We returned in six days by the old Moyra Trail.

Henry Chauncey Cryder.

IN THE BIG THICKET.

The Big Thicket is a dense forest, covering a territory about fifty miles long and from ten to twenty miles wide, situated about seventy-five miles east of Houston, Texas. It abounds in game of many kinds, from the gray squirrel to the black bear, and is regarded as among the best, if not the very best, hunting grounds in Dixie.

This forest is sparsely settled, a large portion of it being so overgrown with brush and vines and semi-tropical plants as to be uninviting to the settler; while large portions of it at certain seasons are partly or wholly submerged. The few typical inhabitants within its borders give most of their time to hunting in general, and deer hunting in particular. These hunters have packs of hounds finely trained to hunt either the deer or the bear, for the bear is not uncommon in this wilderness.

Hunting the wild turkeys, or, as the natives invariably call them, the "gobblers," is a common employment of these semi-aboriginal people.

A more generous, hospitable folk never lived. Their hospitality does not partake of that characteristic at Delmonico's and Sherry's, but is far more genuine and unselfish, though expressed in rough, ungrammatical speech and devoid of the superfluities of etiquette. These brusquely unique people have a special welcome for the stranger coming among them, bearing the rifle and the fishing rod. They are ready to camp with him, and to pilot him through the semi-tropical jungle to the best camping grounds, and where the game abounds.

To reach this Eldorado of the hunter and fisher you go via the Southern Pacific Railroad to the lumber city of Beaumont, eighty miles east of the "magnolia" city—Houston, Texas. From Beaumont an hour's ride on the Sabine & East Texas Railroad brings you to the village of Kountze. Here you can obtain all the necessities for a hunting trip, including guide, dogs and provisions. Within fifteen miles of Kountze the promised land of the hunter is found. Though it may not be "a land flowing with milk and honey," it is one abounding with all that fills a hunter's soul with the keenest enjoyment. To relate the adventures, the defeats and the successes of a typical hunting party in the Big Thicket is the purpose of this article.

Our party was made up of Capt. A. F. Wilson, of Hearne, and Col. A. M. Rhodes and myself, of Bryan. This trip proved to be "the hunt of our lives," as one of our party expressed it.

Our Captain and our Colonel—we give them in their ranking order—reached Kountze at 10:30 Sunday morning, while the high private of the expedition, your humble servant, went before to assist in clearing the way for the coming of mighty experts with rifle and shotgun. Our preparations for the plunge into the wilderness were soon completed, and after partaking of a splendid dinner at the Borber Hotel, which by the way would be a credit to a much larger town than Kountze, we were on the way full of enthusiasm and expectation. At Kountze J. K. Salter and D. H. Hart, old-time residents of this region, joined us. We reached camp at late bedtime that night. Though we were weary with the journey, our eagerness for the fray on the morrow was as keen as ever. Our camp was soon laid out on the banks of a small stream known as Pine Island Bayou, surrounded by an almost impenetrable wilderness. A cheerful fire soon lighted up the surrounding gloom. Our horses were cared for, the tent was spread, and soon we were renewing the inner man with a generous supply of bread, broiled bacon and strong coffee.

Refreshed with supper, we discussed plans for the hunt, and finally agreed upon them. Guns were oiled and put together, shells examined, hunting jackets put within easy reach, and we were prepared for a daylight start.

Of course we swapped camp stories. The Captain and the Colonel tried to say witty things and the Colonel even tried to sing, while the High Private got behind a tree and laughed, which was echoed by the mournful owl, whose peace had been disturbed by the attempts at song, while the hoarse, regretful cry of the coyote filled the forest with what were to us sounds strange and weird.

Our lungs expanded; our anticipations were rekindled, and we began to realize that sense of freedom which only comes to man when he is away from the pomp and power of crowded city and populous mart. We caught something of the thought that in camp "all fallacies are detected, all ranks leveled and all distinctions done away with." Around our camp-fire titles and worldly distinctions were as unreal and vague as the shadows cast athwart the tree branches by the ever-flickering flame. All were hunters, and good will and strong appetites predominated.

"Well, boys," remarked Capt. Wilson, "I can tell you as soon as we make the first run to-morrow whether we will have good or bad luck on this hunt.

"How's that?" asked several.

"Well," replied the Captain, "if we kill the first deer we jump we will have good luck, but if it gets away from us we will have bad luck all the way through."

"How do you make that out?" some one asked.

"I have never seen it fail; I have been on a hundred hunts and it has always come out that way."

Some were disposed to attribute the Captain's statement to a tinge of superstition, while others, more considerate, were inclined to give it consideration. Hunters, as a rule, are inclined to believe the weird, strange and improbable. No one scarcely claims to be a successful hunter who is not to some extent superstitious. The man who would go deer hunting on the "change of the moon," or the fisherman who would fish on the "full of the moon," or either who does not believe in signs, omens and "rabbit feet," will never be called great among his fellows. But we had no chance to test the Captain's statement, as the sequel will show.

By the first streak of day all hands were up, breakfast was put out of sight, horses were saddled and the start was made for our first drive. By unanimous consent Mr. Hart, or Dennis, as he is called, was selected as leader. He seems instinctively to know every step of the pathway blind or clear through the wilderness. The compass, considered a necessity by most hunters and travelers in the Big Thicket, is a superfluity to this true woodsman. Ask him, when and where you will, as to the location of camp, and Dennis will point his long finger with unerring accuracy in the direction of the grub box. He knows every crossing, or how to go around all the "bad thickets," and where to cross all bay galls; but neither he nor any other living man can tell which way a deer will run when started by dogs.

It was decided that we should not take stands, but would breast-hunt; that is, one man would take the dogs in the center and the other hunters would flank him on either side, stationing themselves about 100 to 200yds. apart. At a signal from the driver, as the man with the dogs is called, each one moves slowly forward in line. The plan provides that if a start is made and the deer doubles or turns back some one is almost sure to get a shot. Moving out in this order, Dennis in charge of the dogs, we had gone but a short distance from camp when the dogs struck trail. It was soon evident, however, that it was a cold trail. So eager were all for a run we began to wish the driver would blow off and try a fresher trail. But the dogs kept working it, and by the time they had gone half a mile

"The antler'd monarch of the waste
Sprung from his heathery couch in haste,"

and then the sport began. The deer led off directly from the drive, and according to previous instructions from the leader all hands followed. Before they had gone far, however, our crowd was in bad, bad shape, and about half of them did not know "straight up."

The Big Thicket is what its name indicates. It is simply a big thicket, having the appearance of a dense swamp, though a large part of it is high land, which is dry except after big rains There being but little fall to this land, the surface water is slow to run off.

In places the undergrowth is so thick as to be difficult to travel either afoot or mounted. In many places there are what are called "openings," but they are known only to those who are accustomed to hunting in this region. The stranger who attempts to make his way without a guide through these thickets finds his progress impeded by vines, briers, brush and palmettoes, which in some places grow 10ft. high. But this description applies only to a portion of the thicket. In places one can lope a horse for miles without any obstructions; in others by picking his way and with the liberal use of the hack knife, the *vade mecum* of the Big Thicket hunter, he can make fair headway. Such is the extent and density of these "bad thickets" that the compass is not always to be depended upon, and in some instances gets one into a mess, or rather into a thicket, out of which he must cut his way. Still I can advise no one not familiar with these woods to go into them without a compass, hack knife, and perhaps a balloon and a few days' rations may be necessary.

In less than thirty minutes the dogs were out of hearing and our hunters were scattered in every direction, some trying to get out of unusually dense thickets, some trying to back track themselves to camp, while others, more venturesome, were wandering around trying to ride up a fresh deer. After having been out of hearing more than an hour the faint cry of the hounds was heard. They were evidently returning. We quieted down, as each man was on the alert. On come the dogs, each moment getting nearer and their barking more distinct. Each man decided that the deer was coming directly to him; that he was in the right place.

But all were mistaken except the scribe. I had stationed myself in an open glade near the edge of a thicket, and by the time the dogs were within half a mile of me I heard the deer coming. Strange as it may seem, the longer the dogs run a deer the further it will get from them. This fact is well known to all old deer hunters. When he was within about 60yds. of my covert I gave him my first barrel, which only seemed to cause him to move more rapidly. My second shot did the work, and I then knew that if there was anything in Capt. Wilson's "sign" we had begun a lucky hunt, as the first deer started lay dead before me. The calls were then blown, and all the hounds were soon congregated about our first trophy. The condition of our stomachs and the place of the sun indicating dinner, we decided to return to camp, where our deer was turned over to the cook. Our appetites intensified by the morning's work, added to by the cook's culinary skill, provided us with a dinner fit for the gods.

Soon we started out again. This time the programme was changed. We took stands on an old road a short distance below our camp. Dennis with fresh pack of dogs went below us about a mile to drive back. This time, as before, I was fortunate enough to be in the right place. I had hitched my horse and had just seated myself on a "horsing log" waiting events, when I saw three deer making a bee line for me. I let them come to within about 40yds. when I fired. My first barrel brought down the deer nearest to me, and before the others had made many jumps a second one sunk to rise no more. The third deer, after making a few bounds, stopped short in a small thicket. Hastily slipping a shell in each barrel, the only ones I had, I cautiously started in the direction of the halting monarch of the woods. Before I got within safe range of it it started.

By this time the dogs had started another deer, so I moved back to my stand. Luck was with me, I was again at the right place, and soon I saw another fine fellow bounding toward me. When within about 80yds. of me, and when the deer was near the edge of a dense thicket, I let drive at it with my remaining load, but missed.

At the report of the gun the deer turned toward me, and ran up within 30ft. of me and suddenly stopped. There I stood with an empty gun, with the deer looking at me. At once I had an attack of what is known among hunters as the buck ague. Unless one has had such an attack, no description could aid you to understand what it is. After standing there full two minutes (it seemed like a month to me) the deer started off.

The dogs were soon there, but all my coaxing and scolding could not stop them. On they went, and our day's hunt was over.

Taking the two deer to camp, we turned in for the night, each to recount his adventures of the day, and to tell how near he came to getting a shot and just how it happened that he burnt no powder. All were tired and hungry, but anxious for the next hunt. Our supper that night was enough to tempt the appetite of an epicure. We had venison cooked in several ways, with necessary accompaniments and condiments, besides a delicious stew of gray squirrels, some of our party having shot several that afternoon.

The Big Thicket abounds with all manner of game—squirrels, rabbits, coons, opossum, wildcats, turkeys, panthers and black bears—and it was decided that the bear should be our main object on the morrow. To this end Mr. John Jordan, the celebrated Big Thicket bear hunter, agreed to meet us with his bear pack the next morning. He was promptly on hand with a pack of the finest and most vicious looking dogs I ever saw. There were specimens of nearly every color, size and breed. I wish I could describe this man as he is. About 5ft. 10in. high, weighs about 250lbs., with dark, short-cut hair and blue eyes which "sparkle and dance" as he recounts his many hand-to-hand conflicts with bruin, he looks what he is, a dangerous adversary for man or beast, and a livid scar extending from his ear to the lower part of the chin shows that some biped has had the temerity to "tackle" him, but 'twas no use; he is still hunting bear.

The day he joined us he was dressed in a pair of ducking pants, leather leggings and a short jumper of the same material, and with a broad leather belt, to which hung a long hunting knife. On his head he wore a long cone shaped cap made of coarse cloth, around which near his head was a roll about 3in. in diameter, also made of cloth and tufted with wool—this in case while running a bear he runs against a tree or limb, to prevent injuring the tree or limb. He is entirely illiterate, that is to say, he doesn't "know a letter in the book," but, as the American lady said to the British colonel, "He can make his mark." He has made his mark on more black bears than perhaps any man living. In hunting bears he uses a .44cal. Winchester rifle, and, as he expresses it, "when near enough to his game he just pumps lead into him until he quits kicking."

Before starting on the bear hunt that day Capt. Wilson took me aside and inquired as to the percentage for and against bagging a bear on this hunt. He was told the chances at this season of the year stood about one in four for a start and one chance in ten for a shot if the bear is started. At this season of the year the bears are poor and can run as long and as fast as a deer, and they invariably keep in the worst thickets; consequently, to get a shot is the exception, not the rule. Later in the season, when they are fat, they will run but little, sometimes not at all; then they either tree or fight on the ground until they are killed. It is then royal sport to hunt them. The Captain at once decided to jump the bear hunt and go deer driving with several of us who, having had some experience in bear hunting and knowing how slim the chances to bag game were, had concluded not to accompany the bear hunting party.

After the bear hunters were well out of sight we turned loose a few of the deer dogs and started in quest of more deer. We had gone less than 200yds. from camp when the dogs struck a running trail, and before they had gone very far we knew that the game was afoot. We at once spread out and began pursuit. Capt Wilson turned to the left and had but just gotten out of sight when we heard his gun, and the welcome three blows of his horn were sounded which told us that the race was over. The deer, two in number, after running straight ahead for about half a mile, doubled back on Capt. Wilson, who downed them both in one, two order, so that they fell within 10ft. of each other. These were the best shots of the hunt, as we all declared. We were back to camp with two fine deer, a doe and yearling, in less than an hour from the time we had started, bringing our score up to five. Some of the party continued the hunt for deer, others brought down a lot of squirrels, while some kept camp and indulged in a little draw, "just for fun, you know."

During the day several chances at deer were had, but no more were bagged.

Our bear hunters returned about 3 o'clock in the afternoon. They were hot, tired and hungry and not very amiable, having only blank shots to their credit, and having, as Col. Rhodes, one of the party, expressed it, "not found a ball-headed thing." He further declared they had gone through places so thick that he had to 'lift up the brush to bat his eyes." This closed our second day's hunt.

That night we welcomed to our party J. R. Davenport and Berch Pedigo, of Kountze. They brought with them a few fresh anecdotes.

Before sun up we were out. For hours every deer we started ran wrong, and it seemed that no one could get in the right place, until finally a fine buck "ran over" Mr. Davenport, who promptly prepared the game for transportation to camp, making number six. Several of the party had shots during the day, but Mr. Davenport was the only successful man.

That night Capt. Wilson and I tried our luck fire-hunting, and by 12 o'clock returned to camp with three fine deer, Capt. Wilson having killed two and his companion one.

The next day only one deer was taken. Some of the party went fire-hunting at night, but returned as they went, without any deer. Friday proved to be the typical bad day that it is always said to be, for nothing was killed larger than a gray squirrel.

Saturday morning Capt. Wilson and I went prospecting, looking for a good place to hunt that night. As our dogs were all about run down, we decided that all hands should rest that day and be fresh for an all-night fire-hunt, which would close our hunt for this trip. Accordingly during the day we "looked out" our route for the night, and as soon as it was dark four lamps were lit. Capt. Wilson, Col. Rhodes, Dennis and myself each carried a lamp, and in order to keep from getting lost it was arranged that Dennis should take one side and I the other, while Capt. W. and Col. R. should

occupy the center of the line. Proceeding in this order, we had gone but a short distance when Col. Rhodes began to shoot, and continued shooting until six or seven shots were fired.

This being his first fire-hunt, Dennis at once decided that he had found a bunch of cattle and was shooting them, thinking they were deer. So Dennis started toward Rhodes as fast as his horse could run, shouting at the top of his voice, "Stop that, sir. Quit shooting them cows." But Rhodes kept blazing away.

When Dennis got in good speaking distance of him he again imperatively ordered him to stop, and reminded him of the value of cattle, and suggested that it would take all the money in camp to pay for them; but the Colonel turned on him with a look of scorn and contempt that would have paralyzed a Yankee tin peddler, and quietly yet with great emphasis informed him that he (Dennis) was a "bald-headed fool." "Why, sir," said he, "I have been shooting deer, sir - wild red deer, sir; and I have the face of the earth covered with their dead bodies, sir. So you will kindly keep your mouth shut, sir, and assist me in getting these dead deer together; and if you please, sir, don't leave me too far, as I do not now just remember the direction to camp."

And sure enough he had killed three fine deer, and had wounded two more, one of which we secured later in the night.

About 11 o'clock that night Capt. Wilson killed one of the largest and finest deer we got on the hunt. I got four shots, but no meat. When we reached camp it was near daybreak, so without going to bed we began preparations for our departure to civilization. By noon we were in Kountze again, congratulating ourselves upon the results of our hunt. Our list was: one turkey, fifteen deer, and over 300 squirrels.

This was indeed a hunt never to be forgotten. We had perfect weather, plenty to eat, good water to drink, and good luck. Not a man was sick, mad or hurt on the trip Some very poor shooting was done, principally by the writer, but for which we would have bagged twenty five deer. This fall we plan to visit the Big Thicket again. While we may get more game, we don't expect a better time, as this was the "hunt of a lifetime." W. H. NALL.

BRYAN, Texas, March.

THE PENNSYLVANIA LAW.

DILLINGERSVILLE, Pa., March 15.—*Editor Forest and Stream:* In your issue of March 13 I read an article from the pen of W. W. McCain, of Stevensville, Pa., regarding the proposed game laws of Pennsylvania. I should like to ask Mr. McCain some questions regarding his views as to who protects our game. Mr. McCain rightly says that every good question has two sides. This is very true. Are we then to take for granted that that of Mr. McCain's pot hunter with the yaller dog, whom he seems to protect, is the best side of his question? The man who laughs at game laws and game protective associations? I think it is a fact pretty well known by the readers of the FOREST AND STREAM that the main cause of our game decreasing is supplied by these market-hunters with their yaller dogs. I can point out if need be several parties, who shoot for the market, who would exterminate the last quail in the State for the paltry sum they would derive from doing it. If Mr. McCain wishes to uphold this sort of yaller-dog gentry, all very well; but there are thousands who do not, and will not.

I have lived the greater part of my life in the country, have observed the ways of most all sorts of men who gun, and have come to the conclusion that the worst men on our game are those very pot-hunters. The meanest sneak under the sun is this very game butcher, who loafs around country stores and taverns, waiting until the game season opens to sneak around the fence corners and get in his murderous work on the coveys of quail as they sit huddled together. Is this the kind of men Mr. McCain thinks will protect our game?

Now as to the millionaire sportsmen Mr. McCain speaks of, in all my travels afield with dog and gun in thirty-five years I have met with none. How many has Mr. McCain met? I should also like to hear from other sportsmen, through the columns of FOREST AND STREAM, how many millionaire sportsmen they have met afield.

As to the bill Mr. McCain speaks of that his worthy Governor vetoed, I know all about that bill; it was signed by 75,000 sportsmen (much credit to them). I am proud to say I also signed the same bill, and to day I signed another bill sent me by Dr. B. H. Warren, State Zoölogist, of a like nature. I know it is the desire of every true sportsman of Pennsylvania, whether he be rich or poor, to see the game of his State protected from the yaller dog pot-hunter. I ask Mr. McCain who was benefited by his worthy Governor vetoing that bill? Was it the 75,000 sportsmen who wished to stop the sale of ruffed grouse, or was it the pot-hunter with his yaller dog? Our game can never be protected from extermination so long as the mighty dollar is attached to it; as I have very often heard said: "Field sports were made for a gentleman's recreation and a loafer's business" Mr. McCain seems to have some grievance to settle with the owners of silken-haired setters and a good-fitting suit of corduroy. Oh, jealousy, thou art a corker! I have some wire-haired pointers and silken haired setters—the kind Mr. Hough calls 'meat dogs'—and I really like them much better in the field than those yellow dogs It looks to me as if Mr. McCain was favoring the pot-hunter. Does he not know that it is the well-dressed, well-dogged, well-gunned sportsmen, whom he despises, who restock the farms of our State most every year with game birds, and pay the farmers' boys to feed and protect these game birds during the deep snows of the winter? It is he who goes to the trouble and expense of having live quail shipped from the West and liberated, and perhaps when fall of the year comes around he does not kill a dozen birds out of the hundreds he has put out. Who was benefited by restocking these farms? and why could our well-dressed sportsmen not kill more than a dozen birds? Because they were not there to be killed? It was the same old story, the pot-hunter and his yellow dog got ahead of our well dressed town sportsmen and pot-pied the whole coveys on the ground.

I trust that the time is not far distant when the sportsmen not only of Pennsylvania, but of every State, can say, "We all of us now have worthy governors, who believe in FOREST AND STREAM'S Platform Plank; Stop the sale of game." L. W. MAZURIE.

Editor Forest and Stream:

A few words, please, in regard to "Pennsylvania's Proposed Law." I have always stood squarely with both feet—No. 9s—on your platform plank. Therefore I would take exceptions to the way in which your correspondent W. W. McCain states the situation.

According to Mr. McCain, there are but two classes who kill game, the "millionaire sportsman" and the "farmer's boy" If such were the case, there is no doubt but the game "would hold its own against its enemy, man;" and something such are the conditions that it is proposed to bring about by the prohibitory clause of the proposed new law.

If he had desired to be fair, would he have ignored the class who kill at least nine-tenths of the game taken in this locality? I refer to the market-shooter. And he cannot plead ignorance in justification. Some twenty years' experience as a country merchant, during which time he has taken the game brought in—although he denies being a game dealer—and furnishing in exchange the "tea, coffee or sugar," and the "hundred little things that are luxuries to the poor," and doubtless at a good profit to himself, has not left him without an accurate knowledge of who kills most of the game. I could name at least half a score of individuals, with whom both he and I are personally acquainted, who go out as soon as the law is off and there is a market for the game killed, and make an every-day business of shooting solely for the money there is in it. And Mr. McCain will doubtless remember how he, as a dealer, ordered an 8-gauge gun for one of these market-shooters, as he—the shooter—wanted a gun with which he "could mow all the brush out of the way." Another of these market-shooters was loud in his denunciation of the law passed by the Legislature two years ago; and when he heard that the Governor had vetoed the bill he exclaimed: "Good! Now I will have the last bird this fall." Such is the spirit of the market-shooter—"I want the last grouse as soon as I can get it; it's worth three shillings."

The game forms one of the chief attractions of the rural districts that should be preserved as long as possible. The county of old Susquehanna still furnishes plenty of excellent cover for that king of game birds, the ruffed grouse, and the conditions are much the same in most of the counties of the State. Remove the price from his head, stay the barter, eliminate the principle of "for revenue only" and he will furnish inspiration and sport, not only for ourselves, but for our boys, yet too small to handle a gun, but whom we shall expect, should this bill become a law, to enjoy better shooting in the years to come than we have known in the past.

This rant about farmers' boys in game matters makes me tired. When any one wants special privileges for himself he feelingly pleads their cause. When any one wants to extenuate his own violations of the laws their lawlessness is cited. After years of life on the farm, surrounded by boys of all ages, sorts and conditions, I conclude that farmers' boys are just as conscientious, law-abiding and self-respecting as the boys of country merchants or any other class; and they are second to none in their knowledge of the habits of game, and many of them are well posted and fully abreast of the times in all matters pertaining to field sports. And they are ever ready to welcome any genial, whole-souled sportsman from the town or city who shoots wholly from a love of the sport and the scenes with which it brings him in contact; and they will aid such an one in every way in their power. But for the dude sport, who cares more for the "pistol" he carries in a side pocket than for his smooth-bore; or the dead beat, who cares nothing for the rights or property of others, only intent on the shilling the game will bring—for such they feel a pardonable contempt.

As to the action of the Governor two years ago, we think he made a mistake both from the standpoint of the sportsman and politician, and he doubtless has realized it ere this. As between the cold storage men and the sportsmen of the State, 75,000 strong, there is no comparison. He most certainly made a mistake when he vetoed the bill on constitutional grounds that had been repeatedly passed upon by the higher courts and sustained.

We most sincerely hope the bill now pending will become a law, for to "stop the sale of game" will do more toward its preservation than all the laws now on our statute books. In fact, it is the only thing that will prevent its utter extermination and that within a very short time. BON AMI.

SUSQUEHANNA COUNTY, Pa.

DUCK-HUNTING PORKERS.

YOU of course know what a game hog is, and doubtless in your rambles afield have met many of the two-legged variety, but did you ever happen to come across one of the four-legged breed? An experience I had upon one occasion will, I think, bear repeating.

I was sitting in a blind, built far out on the open meadow, near Custer's Broadwater, Va. An eighth of a mile away there was a depression in the marsh, where the cat-tails and a few low bushes formed a thick cover, used by a dozen or more disreputable porkers as a sort of headquarters in which to spend the night after their fatiguing work of hustling all day along the water's edge for soldier crabs, dead fish, etc.

The evening before I had remained late, and on returning to the yacht failed to remove all my birds from the box, where I had placed them on top of the decoys. There were, if I remember aright, some half dozen calico-backs (*Arenaria interpres*) overlooked, and these were not discovered until the next morning, when, the blind being reached, I started to set out my decoys. They were certainly odoriferous, but nevertheless I utilized them by placing them in as natural positions as possible among the decoys. A gentle air breathed rather than blew across from left to right, and being directly to windward of the depression mentioned above, the rank perfume of the dead birds floated slowly down to where the hogs reposed. You know how one's eyes are continually wandering about in his vicinity at such times. Well, as I glanced over there for at least the hundredth time, I saw an old pig waddle out of the reeds and stand with head in my direction in such a lazy, trampish attitude that my curiosity was mildly aroused as to what he purposed doing. Presently he raised his head and appeared to sniff the air; then slowly, with a hitchy sort of gait, due no doubt to sciatica or rheumatism from sleeping on a damp bed, he started in the direction of the blind; never halting, never hesitating, he hitched along until perhaps half the distance was covered, when another equally trampish looking porker came out, and after repeating the same preliminary action of the first he also came on after. I could not conceive what they were up to, the idea of their following up a scent for such a distance never entered my mind, but so it was.

Number one soon arrived, and stalking without hesitation among the decoys deliberately ate up the dead birds lying there. He took them all in, and then nosed carefully about for more, being joined by number two, who had arrived by this time.

Slowly and thoroughly they quartered the ground. Fearing their presence among my decoys would not prove much of an attraction to passing birds. I arose and shouted to them to move on. It was laughable to see the effect my sudden appearance had upon them; one of them actually squatted on his hams for a moment, so great was his surprise.

They could not run apparently, so they hitched off in the same woebegone and dejected manner as they had approached. There was actually not enough spunk between them to put a curl in the tails that hung down perfectly limp and unkinked.

I have heard of hogs following the trail of crippled wildfowl on the marsh, but this is the first instance of their following a scent that had ever come to my notice. They were truly a fine pair of "dead game sports."

WILMOT TOWNSEND.

BLUEJAY CAMP.

FOR months Sam and John had been planning a camp hunt for ruffed grouse (pheasants we call them). The fates seeming propitious, Monday, Oct. 26, was chosen for the trip. The place chosen was a wild locality, where the timber had been cut several years ago, and was about ten miles from Sam's house. As it was accessible by wagon, we were not forced to scrimp ourselves as to outfit. We took two tents, a sheet-iron stove for cooking on, an oil stove for use in the tent, boards for a bunk, a lot of straw for a bed and lots of blankets. One wall tent was used for a sleeping room and an A tent as a living tent. We intended the dogs to sleep in it, but they preferred the open air.

Warren had volunteered to go along and tend camp, as he was not able to do much hunting; so he and his brother Jim took the wagon and outfit around by the road, while John hunted up the creek with his two dogs, Pard and Gleam; reaching the appointed place about 12:30 with five pheasants. As the boys had not yet arrived with the wagon, he looked around for a place to locate a camp. He found an ideal place across the creek, about 200yds. from the road, from which it was hidden by second-growth pine and hemlock trees. There was an old clearing of about three acres, perfectly level and dry, with plenty of wood and water handy.

The boys arrived about 2 o'clock, and after cooking and eating dinner Jim returned with the wagon, and Warren and John proceeded to set up the tents and get to housekeeping. This took them until nearly dark, but when they had finished they had the satisfaction of knowing that everything was in shape for comfort.

The next morning they were trying to choose a name for the camp, when a bluejay lit on the topmost twig of a big dead pine about 75yds. from the tent.

"That would be a nice shot for my Winchester," remarked Warren.

"You couldn't hit him in twenty shots," replied John.

"Just see if I can't." So saying, Warren picked up his .38 Winchester, took a quick sight, and at the crack of the gun the jay bounced off the limb, and came tumbling to the ground. A fine shot.

"Bluejay Camp," says John, "we'll have a christening when Sam comes."

John then took the old dog, Pard, and went for birds, while Warren washed the dishes and prepared a couple of birds for dinner. When John returned at 1 o'clock with a couple of pheasants he found Sam just arrived, he also having got a couple of birds on his way up. By the time the camp had been christened dinner was ready. The birds that Warren had cooked were so good (as were also our appetites) that after dinner we were more inclined to lie in the sun than take any violent exercise. After smoking our corn-cobs and resting, we started out about 3 o'clock. Sam took his dog Tony and went up the north branch of the creek, where he found a bunch of birds among the little pines, and bagged a couple of them. One of them, which he crippled at the first rise, gave him a great chase up and down the side of the mountain before he finally captured it.

John took the pup, Gleam, and went down the creek below camp, where he got stuck in a windfall where the big pines and hemlocks had overgrown with briers, laurels and pine and hemlock shrubs until it was impossible for anything without wings to get through.

If there is anything exasperating it is to have a pheasant burst out of a tree above your head while you are attempting to crawl under a fallen tree, and have a snag caught in your coat collar, a big brier gripping your ear and your gun tangled up in a laurel bush. He didn't have a feather to show when he got back to camp, but his temper seemed unruffled. "I'm used to it, you know," he said, and Gleam couldn't tell what actually had occurred down there in the windfall.

In the forenoon following they hunted out a strip of woods where they had found birds plenty the year before, but did not find many, and those were very wild. They only brought in a couple. In the afternoon they went up the North Branch, where Sam found the covey the day before. While going up an old timber road hedged on both sides with pine and hemlock shrubs, Tony flushed a bird ahead and just around a sharp turn in the road. Sam, who was ahead, made a break to get a shot as it crossed the road, but the bird turned and flew right in his face. Seeing him just as it was about to strike him, it nearly fell through itself as it set its wings and pitched into the hedge beside him. John made a quick snap into the brush and knocked a wing off it. He retrieved it himself and Sam said he mouthed it badly, besides breaking shot.

A little further along the dogs found a bunch of five or six birds down beside the creek, but the leaves were dry and noisy, and they all got away behind the pines before we could get a shot.

After the birds were all gone, a black squirrel jumped, or fell, from a tree, striking the ground beside Sam, and made off on the ground. Sam shot at it, but it ran up a big tree. While they were looking for it in the tree it fell to the ground dead. John declared it got dizzy and the fall killed it; said it had vertigo or something of that kind, as that was the second time it had fallen from a tree in a few minutes.

We retraced our steps to camp, Sam getting another bird on the way in, and arrived hungry and tired, as usual. The next three days were put in in similar manner, and Saturday morning came too soon, when we had to break camp and return home.

The weather had been too warm and dry for good hunting, but we had reasonably good success and an immensely good time; and we bade good-by to Bluejay Camp, with many pleasant memories and a resolution to repeat the experience next year if possible. Mc.

Eagle Rock, Pa.

LAKE LE SAULMER, WISCONSIN.

This is one of the choice spots for a party of sportsmen to pitch a tent. The site is reached by a wagon road from Fifield, on the Wisconsin Central Railway, distant sixteen miles. The road follows in part the trend of the Flambeau River, whose sparkling waters tempt the traveler to camp on its bank and angle for the lovely muskalonge that sports beneath its surface. Here and there a wily deer has crossed the road and left his footprints in the moist earth, and now and then partridges strut away and are lost to sight in the shrubbery. The quacking of ducks may be heard on the river, and a more home-like sound—that of the tinkling of bells—comes to our ears as the evening shadows lengthen, and straggling bands of horses and cattle gather in some nearby chopping to spend the night. Lake Le Saulmer, nestled among the wooded hills, empties its surplus waters into the Flambeau River a mile away. An old lumber road parallels the outlet and connects with the wagon road, making it convenient to camp at the outlet of the lake. Patches of pine and hardwoods alternated originally, and as the former has been cut out there remains dense forests of hardwood and extensive choppings. Near the railroad a few of these choppings have been cleared, but the soil is thin and a few crops exhaust it. Game seems in little danger of extermination from the clearing up of this section of country; but as for the Indian, who can prevent him from trading summer pelts for "drinking liquor" and feeding his pappooses and curs on tainted venison? From his reservation he roams and camps at will all over northern Wisconsin and the Upper Peninsula of Michigan, and, summer or winter, in season and out of season, his hunting instinct acknowledges no law. Le Saulmer is three miles long by about a half mile wide, and is one of a chain of lakes that affords first-class sport for the angler.

From our camp at its outlet a beautiful picture presented itself as the morning's sun shed its bright rays on branch and shrub, bringing to view millions of dewdrops that scintillated like purest gems in their settings of green, purple and gold. The view extended from the crown of the surrounding hills to the placid bosom of the lake—the diamond superb of the cluster. All the while black bass were jumping for an October breakfast and pine squirrels were chattering among the branches. We caught black bass within 40yds. of our tent with frogs taken from the rushes in the outlet 20ft. from our door.

Following the outlet some 300yds. we found two pools hemmed in by high wooded hills and resembling in form a pair of eye-glasses. One could easily throw a pebble across either of them; but we took some fine bass from them when the air was too raw to angle with comfort on the more exposed waters of Le Saulmer.

There were ten of us in camp, five of whom had at some time in the past killed a deer! Each of the ten would like to kill at least one deer before breaking camp, so after a surfeit of fish and a few dishes of bear steak from the quarter of a black bear trapped by a settler in a logging camp a mile away, we planned a drive hunt. Rain had been falling in showers every now and then for the two days intervening since we had pitched camp, and our short excursions into the forest sufficed to give us an idea of the lay of the land and of the feeding places of deer, but only one of the party had seen game, and he failed to get a shot. Since the deer were not stirring much of their own accord, we decided to form a line and see if we could not persuade them to show themselves. Down the wagon road some three miles, where the river makes a horseshoe called the Big Bend by local sportsmen, there is a chopping that extends from the road to the river, a distance of probably two miles. Here nine of our party formed in line about 75yds. apart and started slowly for the river. We had no dogs, neither were there men on runways. I was on the extreme left and following the timber line, and had crossed a small ridge, when I heard Hutchens, who was next to me, and who had reached the top of the ridge where it ran obliquely up toward the river, exclaim, "Oh! oh! oh!" and then followed the report of his rifle three times in succession. At the same instant I saw the outlines of a buck as he loped off through some shrubbery.

About 100yds. ahead the chopping turned to the left and the ground sloped down toward the river. If the buck attempted to make the timber I would get a shot as he crossed my front, and I prepared to improve the opportunity. He was going from me, but no doubt winded danger off to the right and turned toward the timber. He crossed a slight elevation where the shrubbery did not cover his body, and here I caught a lead on him and pulled trigger. He vanished in the smoke from my rifle and I hurried forward to see the result of my shot, and to try for him again if he was still going. When I reached the mound some 90yds. distant, over which he disappeared, I could see no deer. I saw where the ball from my rifle had clipped some twigs, and there were the tracks of the buck, showing where he had lumbered off among the logs and stumps, covering 20ft. at a bound. But five of these mighty jumps were all he was able to make, for yonder he lay, a magnificent creature with six points to each horn. The boys came up, and we decided not to attempt to take the buck to camp whole, so I proceeded to dress him while they hunted on the river. I left the pelt on the saddles and divided the fore-quarters, making loads for three men. I found my ball had gone through the heart above the center. Hutchens, probably on account of being on the ridge above the deer, had missed, but he has the right stuff in him, and instead of being jealous, as the manner of some is, remarked: "George, I tell you I was glad to hear your gun crack."

The boys jumped a deer soon after they left me, and got some shots at long range; but soon returned, and we started for camp. Southwest of camp were miles of forest, with very little pine. Occasionally we came to an opening where a few large trees had been cut, letting in the sunlight, and a tangle of briers and grasses covered the ground, making a good feeding place and cover for game. These large stumps made fine platforms from which to watch for deer. They were away ahead of a leaning tree or slippery log, from which one may tumble, with no certainty as to how he will strike the ground.

One day our man Headington was resting on one of these stumps. I shall accuse him of resting, for he confessed that he was sitting down on a large pine stump, lost, not as to locality, but in meditation. After a time (which is very indefinite) he heard a slight rustling of the leaves behind him, and turned to see what was causing the disturbance. He was not a little surprised to see a fine doe loping away through the forest. This was Charley's one opportunity. Had he the experience in woodcraft that he has in merchandising, he would either have remained motionless until the deer came by and in front of him, or have turned so slowly as to excite the deer's curiosity instead of frightening it. About a mile further west Hutchens got a shot at a brown bear one evening and wounded it. He followed a while, but had to give over on account of darkness, and it was quite late when he reached camp.

We went out next morning and trailed a half mile or so further by an occasional drop of blood, but as the day advanced and the leaves became dry the trail petered out, and we gave up the chase. Hutchens picked up a wad of brown hair where the bear had stood when he shot, and that was the first evidence we had that there were brown bears in Wisconsin.

Just south of where we trailed the bear I did some very poor shooting one day, and while it is not to my credit it will suffice to "point a moral and adorn a tale." I was following the bent of my inclination and alone, as my habit is, and was approaching a hill. Off to my right was what I took to be a tamarack swamp, and beyond probably was Round Lake, a great lake for muskalonge. Ahead and to the left was to all appearances dense forest. I was at the foot of the hill or ridge when crash! went something over the crest. I sprang forward and bounded up the hill, expecting to see a deer before it got out of range, nor was I disappointed. On the hill I ran into a tangle of logs and brush that a fire had charred, and by the time I could extricate myself from this surprise another one confronted me in the shape of a lake at the foot of the hill. Partially around the lake to the left were a number of dead tree trunks standing among piles of fallen trees and growing shrubs, and through this went like a gray streak what I verily believe to be the largest buck I ever saw. Before I could find a hole in this obstruction the buck was past it, and on a bit of prairie theat joined the lake. He was about two-fifths of the way around the lake, and without taking my eye off him I commenced shooting, holding higher each time after seeing that my shots did not take effect. I sent a fifth shot after him as he went into dense green woods beyond the lake, and then for the first time was brought to a realization of my error. It was not 200yds. across the lake. I had "overshot the mark."

One day when I was doing camp duty Headington and Hoover came in from fishing in one of the small pools before mentioned and reported hearing strange sounds in the forest beyond not unlike the wailing of some wild animal. I had put away the breakfast dishes and had a pot of squirrels stewing. The boys said if I wished to go and look for the brute they would stay at camp until I returned. I took my Winchester and started, passing Gable, our luckiest fisherman, taking a string of bass at the pools, and beyond entered an old chopping. The shrubbery was tall and dense, furnishing good cover for game, large or small. However, I soon came to more open ground, and here a partridge arose and sailed away. A few steps further and a deer jumped and stood showing its outline in the shrubbery about 75yds. distant. At the crack of my rifle it fell. This was getting interesting, even if I had not found the brute I was looking for. I walked down the slope to my deer and found it to be an early fawn. As fawns are liable to be found in pairs, I stepped upon a large pine stump against which my deer had fallen, to take a survey of the field. I was scarcely erect when crash! went a deer on an adjoining hillside. It lit in an old tree top, and the next bound would be behind a clump of evergreens. I threw my gun ahead, thinking to catch it on the jump, and here an amusing thing occurred. As it launched itself forward a limb or pole, on which its hindfeet chanced to rest, broke, and it fell backward on its haunches with its forefeet in the air. I was no better prepared for this than was the deer, and though I pulled my gun around, before I was able to get a bead and press the trigger the deer let itself down and with one bound was out of sight. Once behind the clump of pines, it escaped over the hill. I then shouldered my fawn and made my way by easy stages to camp, having been absent two hours.

About this time our friend in the lumber shanty trapped another bear, and I went over to see it. It had a slender body and large limbs and feet, and in color were was a reddish yellow. I took it for a young brown bear, but it was unlike any bear I had ever seen both as to form and color, and though the woods may be full of them, to me it presented a rare and racy appearance. G. W. Cunningham.

Indiana.

Early Rhode Island Woodcock.

Providence, R. I., March 22.—Town Clerk Angell, of North Providence, had in his possession on Wednesday last (17th inst.) a woodcock said to have been picked up dead in that vicinity. It is regarded as a singular circumstance that a woodcock should be in these parts at this season of the year, and two theories are advanced to account for it. The condition of the bird was good except the eyes, which were sunken so as to be practically gone, and this led some to think that the bird was killed late in the fall, and had lain in some spot where favorable conditions prevailed for keeping the body until the recent warm weather carried away the snow and ice. Judge Andrews, who is well posted on the habits of game birds, thinks the more probable theory is that the bird is a very early comer from the South, which arrived during the warm spell, and perished by reason of the present cold snap freezing all the available food supplies, the woodcock being a feeder upon worms and the like, which it extracts from the ground by means of a long bill. W. H. M.

[There is nothing very remarkable in the occurrence. Woodcock are among the earliest birds to arrive in spring, and have been found in New Jersey and southern New York in February. They commonly reach us in March. May it not be that this particular bird killed itself by flying against some obstacle, and that this would account for the condition of the eyes. Of course, this is only a guess, but an examination of the specimen should enable one to determine the cause of death.]

ADIRONDACK GAME INTERESTS.

Saranac Lake, N. Y., March 16.—*Editor Forest and Stream:* As is usual at each session of the New York State Legislature, numerous amendments are being offered to the game laws. In my opinion, what we need is not so much new fish and game laws as the enforcement of those now on the statute books. It is an open secret that in some portions of the Adirondacks the game laws are flagrantly violated each year. This is not, however, the fault of the chief game protector, but it is because of the lack of a sufficient number of resident game protectors, so that each locality may be thoroughly watched and the game protected from "pot-hunters."

The Adirondack Guides' Association includes the best guides from nearly every portion of the Adirondacks, and it seems to me proper that the game protectors for this region should be chosen from among its number.

I believe that killing deer in the water should be utterly abolished, and that if hounding is permitted at all, shooting on the runway only should be allowed. I think that the majority of both sportsmen and guides are agreed that the killing of does and fawns is inhuman, and should be condemned by law, and that jacking is, as a rule, a wanton and indiscriminate method of hunting deer.

I believe that anything that will preserve the game of the Adirondacks, and increase the deer, birds and fish, will be beneficial to the region, and to the business of the railroads, hotels and guides. I do not believe with some that we have too much wild game in the country, neither do I believe that the game is likely to die of starvation owing to the increase of numbers; but, on the contrary, I think that the country is capable of supporting a vastly greater number of deer and of other game than at present inhabit it, and that if the game can be protected so as to increase and not be rendered timid by noisy pursuit, wild animals will be more likely to become visible; and thus persons who are fond of wild creatures and love to see them occasionally upon the lake shores, or in the woods or in the forests, may have the pleasure of looking at them from time to time.

If this can be done it will prove a great attraction, and bring each year more people into the Adirondacks.

Seaver A. Miller.

Western Spring Shooting.

Nebraska City, Neb., March 12.—Prospects for spring shooting are perceptibly brightening in the West. The unusual amount of snow and rain has filled up the lakes and sloughs of the prairie States in a most satisfactory manner, and ducks and geese will find abundance of water everywhere. Already the advance guard has put in appearance, and quite a number of birds have been killed. As has been usual for two or three years now, the flight is mostly up the Missouri River, but all along the course of the stream they are dropping out into the sloughs, and the sportsmen are beginning to haunt the air holes

Speaking of air holes reminds me that a few weeks ago I read an article in Forest and Stream on the subject of shooting mallards in air holes that had a strangely familiar sound, and sure enough, the other day, in looking through Leffingwell's "Wildfowl Shooting," I saw the article entire. Your correspondent, G. L. R., should be more careful in cribbing other people's thunder. Forest and Stream is hardly the paper in which to steal articles without detection.

It is a little early as yet to make predictions, but I believe the shooting this spring will prove exceptionally good, both for ducks and geese and snipe as well, though the large number of water holes may scatter the birds somewhat.

W. R. H.

Stop Spring Shooting.

Wabasha, Minn., March 13.—*Editor Forest and Stream:* Language cannot express the feeling, bordering almost on contempt, with which the true sportsmen of the Northwest regard the attempt of the poor deluded mortals that are arguing in favor of spring shooting. Their arguments are all so thin that they will not hold water for a moment, and are purely from a selfish point of view. They cannot advance the first theory in favor of it, and it would seem as though they were not endowed with the necessary amount of brains required to discriminate in matters pertaining to the protection of game. All true sportsmen are not in favor of spring shooting, as they see that it is directly opposite to what game protection is expected to accomplish. Verily the "great American game hog" is still abroad in the land, although, thank God, he is slowly dropping out of the ranks year by year, which gives promise of ultimately accomplishing something in the way of game protection. If anyone wishes to "get back at" me for these few broad assertions let him come on. Nature's laws, truth and right are all on my side on this question, and they are "mighty and must prevail."

H. B. Jewell.

Connecticut Deer.

Haddam, Conn.—*Editor Forest and Stream:* Two deer were seen on the east side of the river in this town last fall: one a four-prong buck and the other a full-grown doe. They were seen separately and at different times. These deer were seen on a sort of promontory between the Connecticut and salmon rivers, a section of 1,000 or 1,500 acres of timber swamps and ravines, and less frequented than much of the Adirondacks, and there are many similar tracts of land in this and other towns of the State. Several reports have been published of deer having been seen in different parts of the State during the last year or two, and it is fair to presume that at the end of the close period, viz., Oct. 1, 1903, somebody will have the pleasure of hunting this big game within the limits of this small State. A.

Guns in the Woods in Summer.

Eustis, Me.—*Editor Forest and Stream:* It has been suggested that the law should prohibit the carrying of guns into the wilderness in the close season. To do that would be to kill the flavor of the whole trip for a large part of our best company. Many a sportsman takes his rifle, large or small, on a fishing trip, and has his best fun at the old log bulkhead back of the camp, spattering lead into the bullseye, or (just out of it) breaking in his sights and his gun (also his shoulder), and planning just how he'll do the business next fall, when he comes back to get a bull moose, a caribou, two deer, and the old bear and two cubs that ate up his landing net full of trout that hung on the back of the camp one night. H.

Michigan Goose Flight.

PLAINVILLE, Mich., March 11.—Wild geese going North, lots of them. Robins last week; probably wintered near here. S. B. Negus, of our place, has a fine specimen of the great horned owl alive; no use here, maybe some one would like it. J. H. M.

Weights of Deer in Maine.

EUSTIS, Me.—I am surprised at what are called large deer in Florida. Our Maine bucks go as high as 270lbs. dressed; those of 260lbs. are quite numerous; and those of 230lbs. to 250lbs. are common. H.

Sea and River Fishing.

FLY-CASTING AT THE EXPOSITION.

Special Report for Forest and Stream.

RATHER more than a year ago Mr. J. J. Hardy, of England (then the champion salmon fly-caster of the world), wrote me a letter, which I quoted in this journal, suggesting that the conditions under which fly-casting tournaments in England were held required to be changed materially to eliminate certain objectionable features, which we on this side characterize as fakes. He mentioned the black-leading of lines to prevent their sinking before they were recovered on the back cast, and that a fine and lighter line was spliced to and behind the casting line to enable the caster to shoot the casting line to a greater distance than if his line was all of the same size. At the time I said this was all new to casting tournaments on this side of the water. Particularly he mentioned that in the champion classes in England, in which rodmakers contested, rods were specially made for the contests, and were not such rods as were used in ordinary fishing. The tournament held in Madison Square Garden last week was the first fly-casting contest to be held in this country since I quoted from the letters of Messrs. Hardy and John Enright, the present world's champion salmon caster, and for the first time a black-leaded line was used in this country. It was, however, used but once, although the use of it was traceable to the information furnished by Mr. Hardy's letter, printed in FOREST AND STREAM. As to the fine light line back of the casting line, it has never been used here to increase the length of the cast.

It is true that in some cases rods have been specially made for casting tournaments, but in other cases ordinary fishing rods have been used in making record casts. The special construction consists in making the rod stiff enough to lift the heavy line used in the tournaments. In one instance in the recent contest a "C" line was used on a 5¼oz. rod, but usually a "D" line was used, whether the rod was 5¾, 7 or 10oz. in weight. The rod used by Mr. Hawes in his record salmon cast of 138ft. at Central Park some years ago was an ordinary fishing rod with which Mr. Hawes has killed salmon before and since the tournament. The rod with which Mr. Leonard made his champion cast of 106ft. was a rod of 10oz., 11ft. long. It has an independent handle of maple, which makes the rod a little heavier than it otherwise would be. The rod used by Mr. Cooper Hewitt in his cast of 100ft. 5½in. was 10ft. long and 5¼oz. in weight. The cast was a switch cast. Mr. Leonard, who was second with an overhead cast of 100ft. 3½in., used a rod of 10ft., weighing 5¾oz. In giving weights of rods it should be stated, for purposes of comparison, whether the rods had solid reel plates or not; but some of them had solid plates and some had reel rings only. In a rod of about 5½oz. the solid reel plate weighs ½oz. more than the rings, and in heavier rods the difference is ¾oz. There were no rods used at the tournament, and I think I handled them all or nearly all, that could not be used in ordinary fishing, although some of them were stiffer than would be necessary if lines of smaller caliber were used on them, and the most of them were ordinary fishing rods made for fishing purposes only. To be sure, such rods were unduly strained when the heavy salmon lines were lifted again and again to be cast with all the power of the caster's arm, but I believe not a single rod was broken.

Any one reviewing the records found in this issue of FOREST AND STREAM will notice that some wonderful casts were made and many records were smashed, and yet the reader may feel that there has been a falling off in form of some of the previous record makers. It must be remembered that this tournament was held early in the season, with little or no opportunity for practice, as the blistered hands of nearly every contestant testified, and it was held indoors for the first time under conditions which were novel. For instance, when Reuben Leonard was casting about 100ft. overhead, his fly would strike the flags decorating the balcony boxes behind him on his back cast nearly every cast, and he told me that when he made his record cast of 106ft. he felt his line going smoothly behind him, and concluded that his fly and leader had gone into one of the boxes. All the overhead casters had the same thing to contend with, and the switch casters had to contend with the spectators, who would get in the way and be caught in the loop of the line.

Hiram Hawes has used in all his previous tournaments, and in fishing, a slow tapered rod; but in the dead air of the Garden he could not get his fly out as he could if he had had a quick tapered rod. I noted his casting for him one day in practice and he cast 102ft. as clean and neat as possible with a rod of 7oz. On the other hand, Leonard always used a medium tapered rod, and he had no difficulty, as his records show, in getting out his line when there was nothing in the way behind him. It will be noticed that when it came to accurate casting around and under obstacles the long-distance men got a shade the worst of it.

Some of the cleanest, neatest casting done during the week was done in practice before the crowd gathered to almost lap over the edge of the tank. Mr. T. B. Mills's cast of 110ft. 9½in. was a most wonderful performance, and it is a matter of regret that he should have lost his fly and failed to score his world-beating cast; but Mr. Leonard has cast 111ft. in practice, overhead, with single-handed rod; and Mr. Cooper Hewitt has cast 112ft. in practice, so that it need not be feared that record-breaking in fly-casting has come to an end, whether the next trial shall be made indoors or in the open air.

When the next tournament does take place it is to be hoped that the rules will provide that switch casting will not compete against overhead casting, for it is like matching a trotting horse against a side-wheeler; and make the classes for rod makers and tackle dealers separate from the classes for amateurs and fishermen pure and simple. In this latter suggestion I am glad to say one of the best-known tackle dealers, who as a fly-caster is very near the top, fully agrees with me. Fly-casting tournaments can be made very popular, as witness the attendance at the Garden, but give the club men and fishermen generally a chance to win without the risk of two or three champions walking all over them.

A. N. CHENEY.

There were in each class three prizes, a bronze, a silver and a gold medal.

Casting was done in the afternoon and evening. It proved to be a decided attraction, and was closely watched by large numbers of spectators. The casting tank was made of wood, with a metal lining. It was 78ft. long, 10ft. wide, and contained 2 to 3in. of water only, enough for the purposes of casting. Continuing from one end of the tank and level with it was a wooden platform 40ft. long, on which was a small movable box-shaped platform 1ft. high. This served for the contestants to stand on when casting, and for the long casts was moved back from the end of the tank. Rules, results and records are given herewith.

Rules Governing the Contest.

Rule 1. The contests shall be governed by two judges and a referee. In case of disagreement the referee shall decide.

Rule 2. Arrangements shall be made by the judges so that they may accurately determine the point at which the fly falls.

Rule 3. All persons competing for prizes shall pay an entrance fee as follows: $2 for one event or $5 for three or more events. Post entries may be made, but no entry allowed after contest commences.

Rule 4. The order in which contestants shall cast shall be determined by the judges. The contestants must be ready when called upon by the judges.

Rule 5. The leader and fly in each contest must be intact at at the time of record by the judges.

Rule 6. After the contestant has taken his place upon the stand the time shall be allowed from the time the contestant says "ready." The first cast thereafter shall count. The longest cast during the five minutes succeeding shall be taken as his record for distance.

Rule 7. The rod must be held in one hand while casting.

Rule 8. The barb and point must be removed from all hooks used.

Rule 9. Trout flies of the usual Professor type, not smaller than No. 12 or larger than No. 8, shall be used in the contests, unless otherwise specified.

Rule 10. Time will be allowed, in cases of accident, to make repairs, at the discretion of the judges.

Rule 11. All other difficulties arising shall be decided by the judges.

SINGLE-HANDED LONG-DISTANCE TROUT FLY-CASTING CONTEST.—Open to those who have never cast more than 75ft. in any contest. Judges: James L. Breese, T. B. Stewart; Referee, W. C. Harris. Rule 1.—The rod must not exceed 11ft. 6in. in length. Rule 2.—The leader must be of single gut, and exceed 9ft. in length. Rule 3.—Straight forward and back casting only allowed. Rule 4.—One fly shall be used.

1. W. G. Levison.....57ft. 3. J. von Lengerke.....29ft.
2. Dr. H. L. O'Brien.....49ft. Victor R. Grimwood..25ft.

SINGLE-HANDED LONG-DISTANCE TROUT FLY-CASTING CONTEST.—Open to those who have never cast more than 60ft. in any contest. Judges: H. C. de Rham, D. T. Kennedy; Referee, Dr. S. M. Nash. Rule 1.—The rod must not exceed 11ft. 6in. in length. Rule 2.—The leader must be of single gut, and exceed 9ft. in length. Rule 3.—Straight forward and back casting only allowed. Rule 4.—One fly shall be used.

1. C. M. Roof.....67ft. Dr. H. L. O'Brien.....53ft.
2. H. S. Wells.....66ft. W. C. Spencer.....52ft.
3. Wallace G. Levison...54ft.

LIGHT ROD SINGLE HANDED FLY-CASTING CONTEST FOR DISTANCE ONLY.—Open to those who have never cast over 65ft. in any contest with a rod of 5¾oz. or under. Judges: A. N. Cheney, G. P. Morosini, Jr.; Referee, T. B. Stewart. Rule 1: Rod not to exceed 5¾oz. in weight. Rule 2: Leaders must be of single gut, and exceed 9ft. in length. Rule 3: One fly only shall be used.

1. C. G. Levison.....74½ft. H. L. O'Brien.....66ft.
2. H. S. Smith.....68½ft. D. Brandreth.....65ft.
3. Clarence M. Roof....68ft. D. T. Kennedy.....61ft.

LIGHT ROD SINGLE-HANDED FLY-CASTING CONTEST FOR DISTANCE ONLY.—Judges: Thos. B. Stewart, Clarence M. Roof; Referee, Robt. D. Lawrence. Rule 1: Rod not to exceed 5¾oz. in weight. Rule 2: Leaders must be of single gut, and exceed 9ft. in. length. Rule 3: One fly only shall be used.

1. P. C. Hewitt...100ft. 5½in. 3. Thos. B. Mills....83ft. 6in.
2. R. C. Leonard..100ft. 3½in. Hiram Hawes.....78ft.

BASS FLY-CASTING CONTEST FOR DISTANCE ONLY.—Open to contestants who have never made a record of over 70ft. in any contest. Judges: A. N. Cheney, T. B. Stewart; Referee, R. C. Leonard. Rule 1: The leader shall exceed 6ft. in length. Rule 2: One No. 4 fly shall be used, and will be furnished by the judges.

1. E. R. Hewitt.....79ft. 3. D. Brandreth.....68ft. 6in.
2. C. H. Mowry.....72ft. W. C. Spencer.....53ft.

BASS FLY-CASTING CONTEST FOR DISTANCE ONLY.—Judges: T. B. Stewart, H. O. Stanley; Referee, C. G. Levison. Rule 1: The leader shall exceed 6ft. in length. Rule 2: One No. 4 fly shall be used, and will be furnished by the judges.

1. R. C. Leonard..101ft. 6in. Chas. B. Mills.....92ft.
2. H. W. Hawes.. 98ft. 3½in. E. R. Hewitt.....75ft. 6in.
3. P. C. Hewitt... 95ft.

SINGLE-HANDED TROUT FLY-CASTING CONTEST FOR ACCURACY ONLY.—Judges: T. B. Stewart, W. C. Harris; Referee, W. S. Allerton. Rule 1: After the contestant has signified his readiness he shall make five consecutive casts at a mark. The distance at which the fly drops from the mark at each cast shall be noted and the sum of all these distances in feet and inches added together shall be subtracted from 100. The contestant having the highest average shall be declared the winner. Rule 2: One fly only shall be used. Rule 3: The leader shall exceed 6ft. in length. Class 1: The distance shall be 65ft.; Class 2: The distance shall be 50ft.

	50ft. Accuracy.*	65ft.
W. H. Hammett	85	....

* Fractions of a foot are given in decimals.

Awards.

Class 1: First, D. T. Kennedy, gold medal; second, R. C. Leonard, bronze medal. Class 2: First, D. T. Kennedy.

SINGLE-HANDED LONG-DISTANCE TROUT FLY CASTING CONTEST.—Judges: R. N. Parish, Dr. C. M. Nash; Referee, W. C. Harris. Rule 1: The leader must be of single gut, and exceed 6ft. in length. Rule 2: One fly must be used.

1. R. C. Leonard.....106ft. C. G. Levison ... . 73ft.
2. Thos. B. Mills..... 91ft. Clarence M. Roof.... 72ft.
3. D. T. Kennedy..... 76ft.

OBSTACLE CASTING FOR DISTANCE.—Judges: T. B. Stewart, D. T. Kennedy; Referee, R. N. Parish. A horizontal bar shall be placed in front of the contestant at a distance of 30ft., and 9ft. from the water level. Rule 1: The leader must be of single gut and exceed 6ft. in length. Rule 2: One fly must be used.

1. E. R. Hewitt.....75ft. P. C. Hewitt.....69ft.
2. R. C. Leonard ....74ft. 9in. D. Brandreth.....60ft. 6in.
3. Hiram Hawes.....69ft. 6in.

OBSTACLE FLY-CASTING CONTEST FOR ACCURACY AND DELICACY.—Judges: R. N. Parish, John P. Elton; Referee, Harry R. Harris. Details of conditions and rules to be left to the judges. There will be placed on the left side of the tank (which is 10ft. wide) a bush overhanging the water 3ft. and above the surface 3ft., distance from the casting platform 30ft.; also another bush under like conditions on the right side of the tank, distant from the platform 40ft. The contestant who places the fly most delicately and nearest the side of the tank to take first award.

John T. Landman...38⅞ft. Hiram Hawes.....45½ft.
R. C. Leonard.....39⅝ft. P. C. Hewitt.....36 9-10ft.
D. Brandreth.....36 9-10ft. E. R. Hewitt.....36ft.
Clarence M. Roof....24 9-10ft.

Awards: 1st, Clarence M. Roof (first for accuracy); 2d, E. R. Hewitt; 3d, D. Brandreth.

Brandreth awarded first honors for delicacy.

SWITCH CASTING CONTEST FOR DISTANCE.—Judges: Robert B. Lawrence, Nash T. Smith; Referee, T. B. Stewart. An obstacle will be placed back of the contestant in a manner prescribed by the judges. Rule 1: The leader must be of single gut and exceed 6ft. in length. Rule 2: One fly must be used.

1. R. C. Leonard.....91ft. 6in. 3. C. H. Mowry.....62ft. 6in.
2. P. Cooper Hewitt. 90ft.

SINGLE-HANDED LONG-DISTANCE TROUT FLY-CASTING CONTEST.—Judges: Robt. B. Lawrence, S. M. Nash; Referee, J. L. Livingston. Rule 1: The rod must not exceed 11ft. 6in. in length. Rule 2: The leader must be of single gut and exceed 9ft. in length. Rule 3: Straight forward and back casting only allowed. Rule 4: One fly shall be used.

1. R. C. Leonard....105ft. 6in. Thos. B. Mills.....90ft.
2. Hiram Hawes.... 98ft. 6in. John T. Landman.82ft. 6in.
3. P. Cooper Hewitt 95ft. 6in. N. S. Smith.....78ft.

ANGLING NOTES.

Women at the Sportsmen's Show.

A NEW YORK newspaper, in giving an account of the opening of the Sportsmen's Exposition in Madison Square Garden, says: "The old dictionaries do not give a feminine for gunner, and the 'brothers of the angle,' beloved by Izaak Walton, cared little for women save the milkmaids, who would slake their thirst from the brimming pail-; but in these modern times the women are as prominent in outdoor recreations as men."

It is lamentably true that in the days of Izaak Walton the women of that time cut no particular figure as devotees of angling, or if they did there is no record of the fact; but all that is changed for the better, as is shown by the concluding sentence that I have quoted. If the writer had stopped there I would not have written this note, but he goes on to say: "There were as many women as men at the show last night, and the makers of guns, fly-rods, athletic goods, boats and launches cater for the women's trade fully as much as for the custom of their brothers. This medley of the sexes in search of the latest novelty in their particular sporting fad gave animation to the gathering." What I object to is the word *fad*, and I deny that women as a rule follow any branch of sport as a fad. Let us see what a new dictionary says about the word: "Fad, n. A trivial fancy adopted and pursued for a time with irrational zeal; a matter of no importance, or an important matter imperfectly understood, taken up and urged with more zeal than sense; a whim; a crochet; a temporary hobby." If there are any women who have taken up sport, such as angling or shooting, as a fad, I do not know of them. I do know, however, many earnest, sensible women who have taken up sport, in one branch or another, seriously and for their own profit and pleasure, and who pursue it as faithfully and intelligently as any man, and who are as accomplished in the field as the men. There is a letter on my desk received within the past twenty-four hours, and it says: "I send you a newspaper clipping. Present it to every one interested for me," and I know of no better way to present it to every one interested than through the columns of FOREST AND STREAM, and here it is:

"The open season hereabouts for upland game (grouse, quail, etc) is over, but the markets and stores are full of these birds, presumably from other States. The law which permits the sale of birds at this time of year if killed outside of the State is a great boon to the market-shooter If I sell the storekeeper ten couple of quail shot in New York or New Jersey, and he tells the law that he bought them from a man who killed them in Japan or any other old place, what are you going to do about it? Stop the sale of game out of season, no matter where shot, gentlemen, or you will have no game to sell in a few years."

The writer of the letter who sends the clipping says further:

"There is no doubt that this is the only way to preserve the game, for just as long as game can be sold openly just so long game will be killed secretly out of season and sent to market from this State (New York) under cover, and once in market it appears as game killed 300 miles beyond the borders of the State. We have got to face the consequences of this very bad law (Section 249), and the sooner we do it the better for our game."

The writer of the letter is a woman, one of the bravest little women that it is my good fortune to know, and she is always battling for the welfare of the fish and game of the State. She knows the difference between good laws and bad laws, and if half of the men who claim to be sportsmen had her energy and were possessed of her unselfish interest in the fish and game, and had acquired the same knowledge in the field that she has of what is absolutely necessary to preserve the game, the bad laws would be wiped from the books. If one should meet this refined, womanly woman at some great social function in town—thoroughbred to her finger tips—one might imagine perhaps that sport would be with her a fad; but change the environment to the country of forest and streams, and with double gun, rifle or rod she asks no allowances from the men, but stands at the scratch, whether the game be deer, bear, fox, birds or trout, and then it would be a brave man indeed who could look into her honest eyes, sparkling with enthusiasm, and tell her that she considered sport a trivial fancy. When she tells you that there is something loose in a law that provides that "No person shall kill or take alive more than two deer in any season," and yet three men may go into the woods and kill six deer while two of the men do not fire a gun, the criticism does not arise from the fact that she considers deer shooting a temporary hobby. When she says, "Much as I love deer shooting, I would willingly hang up my guns in the gun room to remain unused rather than have the slaughter of the past few years continue," it is not a whim. Standing on a runway while the hounds were running a fox, a deer appeared before her, started by the dogs; she said: "I was watching for a fox, but I wanted that deer, for my deer hunting had been most wretched during the deer season; but as I brought my gun to my shoulder it flashed into my mind that the deer season had closed, only a few days, to be sure, but closed, and I lowered the gun and watched the deer until it passed out of sight."

I hope some day to be permitted to tell of a score she made trout fishing. The trout can be numbered on the fingers of one hand, but many an angler with frosted paw would be exceeding glad to mark the weights of the trout in his fishing record as his own catch. Secretly I have, in my heart, long

regarded this friend of mine as a "dead game sportsman," never striving for a feminine equivalent for the term, although I have hoped to refine the language of the thought somewhat before I gave it speech. When I think of this perfect type of a gentle, cultivated, womanly woman, who pursues sport for health and pleasure, and rears her children to be manly men and refined women, while they follow her example—and I know there are others in the world like her—I naturally dissent from the expression fad as applied to women in the "Medley of the Sexes," and I will let the men defend themselves.

Striped Bass.

A gentleman in New York city has written me the following letter: "I address you in behalf of an old and valued friend, whose pursuit for more than thirty years has given me a great deal of genuine sport and pleasure, and, from what I believe to be inadequate protection, will not much longer frequent the waters of the State in the numbers he has—the striped bass. The only reference to the fish in the laws of our fisheries and game is Section 121, relative to length of striped bass which may be taken. I was informed that a law or section of law was to be passed near the close of last winter's session of the Legislature (but for some reason or other was hung up) for the better protection of striped bass. I am satisfied from my own observation and the reports of, I may say, hundreds of hook and line fishermen who persistently fish for the salt-water striped bass, that their numbers are lessening yearly. There have been good reasons for placing Section 121 in the law, and it meets with approval, because a fish of less than 8in. in length would be of small or no account as food to any one. It is the unanimous opinion; however, of all with whom I have talked that the method of taking this fish at any time other than with hook and line should be considered illegal in the waters of the State. I have seen these fish in September and October say 12 to 14in. in length, beautiful and symmetrical in their dimensions; and in the following January fish of the same length are full of spawn, with an increase in depth from dorsal fin to belly of 2in. or more. These fish are taken from the waters of the State by other devices than hook and line.

"It is said that the striped bass of salt water has become a high-priced fish because of its scarcity, and the poorer classes of our community cannot afford to buy. It inhabits our local waters, and the neighborhood of Croton Point, in the Hudson, is considered one of their best spawning grounds, and they are taken here when they should not be by fishers for the markets. If the capture of these fish was prohibited for a term of years it would doubtless tend to multiply their numbers and bring prices within the reach of all who desire this splendid food fish; but do you not think that a law should be passed by the present Legislature prohibiting the capture of striped bass in the waters of the State at any season except by hook and line, and make a close season from November to the following May, or such other safe dates as to cover the spawning season?"

There is a bill now before the Legislature, introduced by Mr. G. W. Meyer, Jr., 30th Assembly District of New York city, which provides a close season for striped bass from Jan. 1 to May 1 following, and the 8in. limit of length is retained. The bill was introduced as No. 516, read once and referred to the committee on fisheries and game, reported from said committee with amendments and ordered reprinted (No. 1,159), and placed on order of second reading as amended. It seemed to be the opinion in Albany that this bill would finally pass.

It is my opinion that all food fishes which spawn in the fresh waters of the State, or in brackish waters of the State, should be protected during their breeding season, but it has long been an open question when the striped bass did spawn in our waters. The United States Fish Commission says: "They spawn in the late spring and early summer, some of them in the rivers, others probably at sea, although this has not been definitely ascertained."

The striped bass has been hatched artificially first by Holton and afterward by True, I think; but my recollection is that those hatched in North Carolina (and this is where they were hatched) were hatched in July, but my memory may be in fault as to the time. If I am anywhere near right, the close season provided in Mr. Meyer's bill will not cover the spawning season in New York waters. My correspondent speaks of striped bass having spawn in January, but it does not follow that the spawn is anywhere near ripe at that time. Brook trout have spawn in May, but it does not mature until the following October, and there is a vast difference between ripe and unripe trout spawn. Striped bass eggs are smaller than shad eggs, but the fishermen themselves should be able to throw light on the spawning season without reference to the size of the eggs. Since the foregoing was written I find that it was Maj. T. B. Ferguson who hatched striped bass in North Carolina, and they were hatched in May, 1879. The eggs hatched in twenty-four hours.

There should be a close season on striped bass from May 1 to June 30.

Fish Food in Nevada.

The report of the Fish Commissioner of Nevada has just been received, and under the heading "Fish Food" I find that the Commission has planted crawfish for trout food in some of the waters of the State. "On the same day I deposited five dozen of the larvæ of the salmon fry (*Corydalis*). I investigated for results in the fall of 1896 (a year later, for they were planted in May, 1895) and found the *Corydalis* in large swarms."

Large swarms from a plant of five dozen! Just see what the possibilities are in this line. But are we to understand that this is *Corydalis cornutus*, alias the helgramite?

A. N. Cheney.

Mr. Mott's Salmon.

There was shown in the Forest and Stream's exhibit at the Sportsmen's Exposition last week a Restigouche salmon taken at Dawson's, on the Restigouche, Canada, June 10, 1896, by Mr. Jordan L. Mott, Jr., of this city. The fish weighed 40lbs., and Mr. Mott's time in killing it was 45 minutes. It is a handsome fish, and attracted much attention.

North Carolina Striped Bass.

Swansboro, N. C., March 11.—Striped bass or rockfish were in evidence at Swansboro on March 5. Eighteen were caught which averaged 12lbs. apiece, and sold for 75 cents each. C. H.

Florida Tarpon.

Punta Gorda, Fla., March 18.—Mr. John Caswell has landed five tarpon here this week. F. F. F.

MEN I HAVE FISHED WITH.

XXXVI.—Mr. Almy.

I had often heard that it was thought to be great sport to shoot fish with a bow and arrow in parts of the South, especially in Louisiana, and now the opportunity offered to take part in it. Others had confirmed what my darky boy Pete had said about Almy being an expert at this sport, and in conversation he said: "Down the river there are places wide and deep where there are big fish, worth shooting at, and it is easy enough to float down twenty miles, but it's all paddle coming back, and while the current is not strong, it is not fun to paddle a dugout that distance up stream. Can you paddle?"

"Yes, I can paddle, and keep the paddle on one side of the boat and never take it out of the water, if necessary; I wouldn't propose to go if I couldn't paddle, for two are enough on such a trip, but I've got a better scheme. We'll go down, do our fishing and then get a wagon, take the canoe to Ponchatoula and put it on a freight train for home. How will that suit you?"

"Good! How long do you want to be gone?"

"We'll stay out two nights if the mosquitoes will permit. You get ready to start in the morning, after breakfast, and I'll send all the provisions that we want down to the boat, if you'll have something to protect them from sun and rain."

As we left Tangipahoa the morning was cool and delightful. A light rain in the night had discolored the water a little, but the little river was not high. Mockingbirds were rejoicing in the fullness of life, each trying to beat the other in some difficult run or trill. The soft cool of morning and evening was delicious here, but the noon was torrid. We protected our faces and hands with tar and oil from the clouds of punkies, gnats, mosquitoes, gallinippers and an unnamed host of hungry phlebotomizers which thirsted for the last drop of blood we had. But while our exposed surfaces were well defended, our thin clothing was easily pierced, and so we made smudges of fungi in two iron pots and made the best of it.

Almy was greatly interested in my outfit of flies, fly-rods and reel. He wanted to look the fly-book all over, handle the gut leaders and play with the reel. The rods he did not think much of, from the scant attention he paid them, but after the inspection was completed he said: "Let's see you catch a fish with them things." He watched the process of rigging up and of casting with great interest, and when a black bass took one of the flies and bent the rod he got excited and called out: "Let me get hold of the line! He'll break that little pole! Pull him in now!" and a whole lot of other advice. When I lifted a 3lb. bass in the landing net he simply said, "Golly!"

I unhooked the fish and let it go, much to Almy's surprise, for in this land of plenty he had never thought that there was need to spare what was not required for use. He agreed that it was a sin to kill an animal when its flesh or skin could not be utilized, unless the animal was injurious to man in some way. He wanted to try fly-casting for bass, and while I feared for my tackle, I had a reserve in case of disaster. He promised to keep cool if he hooked a fish, and to obey my orders. The rod was ash and lancewood, and it troubled him to cast its length of 9ft. without fouling it. I put the canoe ashore and taught him how to get out about 20ft. of line, and we started out into the river. After a few casts he hooked a fish, and checked and gave line as I ordered. After a short fight he reeled the fish up near the boat, and as I said, "Hold still, keep him there!" and moved to put the landing net below him, Almy tried to lift the fish into the boat pole fashion; the fish made a dive as the tip broke, the reel sung until the bass reached a tree top, where it took several turns around a limb, snapped the gut leader and escaped. I saw the fish, and judged it to weigh about 4lbs. Almy had a lesson in handling light rods and a lecture on the use of landing nets. A spare tip replaced the broken one and he brought a small fish to the net.

By this time the air was warm and close, as nothing stirred along our crooked and heavily wooded stream.

We went ashore to cook dinner. Wishing to see as many fish as possible in these strange waters, I put out two lines to the bottom, one baited with a big earthworm and the other with the tail of a crayfish, and soon had two fish in the boat; the worm having taken a big black sucker which Almy called a "black horse," and the crayfish captured a spotted catfish. "These," said Almy, "are the two best fish in the river, better than trout or buffalo." The sucker might have weighed 5lbs., and the other perhaps ½lb. We fried them, and I agreed with my friend. They had not the weedy taste of his "trout," which I preferred to call a "big-mouth black bass," nor were they as muddy as the buffalo. We had good salt pork for frying, and unless you use sweet oil you can't beat it much.

The river was so full of fish that you could catch a dinner in a few minutes, so we fished along and released the fish as we caught them, and I made a note of the species and their local names. The dogfish of the Great Lakes was a "bowfin," the fresh-water drum was "gaspergou." The name of "bass" was replaced by "perch," and "sun perch," "red-eye perch," etc, were common, but I was surprised not to find our common yellow perch there. Neither did I find a pike, except a little fish of 6in. much like our Northern brook pike. About 4 P. M. the river broadened to a quarter of a mile, and about a mile down we made our camp on a low point and prepared for the night. We found a dry knoll, covered our provisions in the end of the canoe, which was raised on a log to keep dry in case of rain, cooked supper, gathered fire wood and drift boards to make a shelter alongside the canoe, spread our rubber blankets under them and lay down.

Almy was a good woodsman, was quite intelligent, and, with the exception of his belief in voodooism, as related in the last chapter, there was no sign that he was "off," or, as Bell would have expressed it, "had rats in his garret." All day long I had been interested in the abundance of life. Snakes, turtles and frogs glided, slid and plunged into the water; strange birds called, sung or flitted; kingfishers rattled and dove, while bitterns, herons and other birds croaked, drove stakes or pumped thunder. The wealth of fish and reptile life brought an abundance of the solitary birds which feed upon it.

Now as an old camper and campaigner, who from 1854 to 1865 and slept more nights under the open sky than under a roof, I thought I knew a whole lot about the sounds of night; but on that point of land, surrounded by swamp and lake near the coast of Louisiana, it seemed as if the echoes of all the night sounds I had ever heard had come back and focused right there on that June night. Owls innumerable, and apparently of all the sizes that owls are permitted to be, screeched, laughed and hooted; night-herons "quawked," gurgled and fanned the air with their wings; shrill cries from other wading birds, to the deponent unknown, added their voices to the night's discord. I've tried to think of something to say of the voices of the frogs in this happy frog land, but, like that historic man who was famed for profanity and was dumb when the boys pulled the tail-board out of his wagon load of apples when going up hill, I can say: "I can't do justice to the subject."

We found a breeze come up from the southeast about sundown and that meant freedom from mosquitoes and other insects, for they can't stand against a light wind. "Almy," said I, "this is delightful; will it last all night and allow us to sleep in peace? I don't mind the racket, but I'm a sinner if I want to be tormented all night and get up in the morning too weak from loss of sleep and blood to enjoy the fishing."

"Yes, it is seldom that we don't get a sea-breeze here. We are only about ten miles from Lake Maurepas, which empties into Lake Ponchartrain, and not over fifty miles from the Gulf of Mexico, and it's open water most of the way to the southeast; you know that New Orleans is between Ponchartrain and the Mississippi, and we could paddle there easily to-morrow."

Giving assent to his assumption of my geographical knowledge, which I had probably possessed in schoolboy days, but now relearned, I turned the talk to the racket about us by saying: "There is a frog here which makes a rattling sound like bone 'clappers.' I never heard it anywhere except in Kansas, do you know what it is?

"No, I don't, but it is probably one of the small kinds. Do you know that there are several kinds of frogs, and that some never grow big?"

"Oh, yes; in the North we have the big bullfrog, which may be green or brown, and the spotted meadow frog with a yellow vest, the tree frogs, which we miscall "toads," and rarely a small swamp frog, with long legs and a white line running back of its eye. An old friend, who shoots and traps for a living, tells me that this little frog makes a clacking noise, but I never heard it in New York."

"That may be the little fellow that does it. I've seen 'em, but never heard 'em peep. That darky boy, Pete, says you eat frogs. Is that so?"

"Sure, and I'll cook you some to-morrow."

"Me? I wouldn't eat one for a farm."

"Say, what do we want of these boards over us? It's starlight and ain't a-goin' to rain."

"Don't you remember when we was a-comin' down the river I called to you to look out when a shitepoke, as you call 'em, was flying over—we call 'em thunder pumpers from their noise—an' once you dodged an' had a close call? Well, these quawks are 'bout as bad, and you noticed how they foul the shore. They cross this point further down, as a rule, but it is well to be careful."

In the morning the boards bore evidence to Almy's wisdom when camping in Louisiana swamps. A few large cumulous clouds were floating lazily in the air, and we were now to try the new sport of shooting fish with the bow and arrow before the sun got too warm. A long bundle of canvas was untied and the implements taken out. A fine cedar bow, 6ft. long, strung with a cord of rawhide, several ashen arrows about 3ft. long, and a light iron spearhead are the whole outfit. This spearhead has a flat, sharp point, behind which is a hinged barb, which lies in a recess until an attempt is made to draw it from the body of a fish, when it spreads out like the "toggle" of a whaler's harpoon, the arrow complete weighing about 4oz. There is a socket on the spearhead into which the wooden arrow fits so loosely that it falls out and floats when a fish is struck, while a light cord which is fast to the spearhead holds the fish.

After breakfast we shoved off and paddled out into deep, open water. There was no perceptible current here in the broad water, and not breeze enough to ripple the surface and prevent seeing the fish. Slowly paddling along and watching the water over the side of the boat, I never saw so many live fish anywhere—fishes of various shapes and sizes, from minnows up to gars 5ft. long. "Shoot a gar, Almy," I said.

"No use to shoot a gar in the back, your steel will glance off his hard scales. A little later in the day they'll be floating at the surface, and then if you can get the arrow into its gill it's the only chance. Turn up by that tree top. Steady, stop!" And drawing the arrow to a head he let it go and it struck the water about 8ft. from the boat, the wooden shaft floated up, and by the running line it was evident that a fish was struck. Gradually checking it, he gently pulled in a "black horse" sucker of some 6lbs. I had shot fish in Kansas with a rifle, and speared them in Wisconsin, but this sport evidently required the same care in judging between the place the fish really occupied and its apparent position, the refraction being greater the further away the fish happened to be, and it required more skill to speed the arrow to the mark than to hurl the spear or shoot the bullet; therefore it was more sport.

The water was not very clear, and while I could see straight down in the shade of the boat, one could not see far in the water at an angle, and it was interesting to hear Almy discourse on the character of bubbles. The surface was dotted with those little bubbles that come from gases in the mud or from minute insect life which seem to simmer on the surface, but he was watching large ones and commenting on them.

"See that string of small bubbles slowly moving toward us?" he asked. "Well, that's a turtle working in the mud, and the air comes out of the mud and the bubbles seem to hang on long before bursting, but here to the left are brighter bubbles that come up swift and in patches; they break at once. There's fish feeding there, but unless they leave the bottom we can't see 'em. Paddle over the other side, in the bend where the weeds are, and we'll try it there." We found open places among the weeds and lily-pads and I watched Almy kill several fish, including a big gar which he struck in the gills, as he had explained. His marksmanship at varying distances and degrees of refraction was excellent. He wished me to try it and I did, but my admiration for his skill increased with every shot I made. Finally I said: "Almy, there's a soft-shelled turtle crawling under the boat, shall I try him?"

"Yes, plug him when he comes out on the other side."

I shot and fastened the barb in him and he began to

burrow in the mud. This gave the animal a purchase that strained the line to the danger point; the water was too deep to dislodge him with the paddle, and in my anxiety I appealed to my companion.

"Put a strain on him," he said, "don't let him gain another inch an' mebbe he'll get tired or mebbe the line will break; try it that way a while."

"If the line breaks your spearhead is lost."

"Never mind that, there's two more in the bundle. I want that turtle to take home, it's all the game we can take, for fish will spoil."

I checked all progress at the other end of the line, and waited until the muscles which were working in the mud might tire. The hope was vain. I think he would have been there hanging on until the close of this fading century if I had not become weary of inaction. My friend offered no suggestion, but was contemplating nature and perhaps revolving in his mind the mysteries of voodooism. The fact that if the line should part we might survive the shock gradually dawned, and from a passive resistance I slowly put an aggressive strain on the line, and it yielded. The enemy evidently was not "wishing for night or Blücher," but for a firmer anchorage than river mud, for there was no sign of muscular exhaustion when he came on board and made our acquaintance.

No more shots with an arrow for me. I had a record; you may call it an accidental one if you wish, but still a record; and if the laurels were thin I can console myself with the thought that they're much thinner where there isn't any.

Mr. Almy had not only opened up a new sport, but had taught me several things, especially about the character of bubbles coming from a bottom of soft mud, and in turn I could show him the relationship between aquatic larva of insects and their adult forms.

The morning was passing, the faint breeze expired and we returned to camp to sit in a smoke which just permitted us to exist, while it drove off our insect enemies. I often wonder if they suffer more than we from a stifling smoke, or if we brace ourselves to stand it, knowing that they are suffering as much, but that if we hold out a while the enemy will retreat and leave us in possession of the field. It's a question of pluck and endurance, especially the latter, with us; for if the smoke lets up for a moment the enemy will make a dash for your blood. With the man it is merely a question of two evils, smoke or mosquitoes, and he chooses what he thinks to be the least. Not so with the insect. If she—here I take off my hat to say that those people whom my boy, Charley Bell, if he were alive, would call "the scientific Alecs" have recorded that it is only the female mosquito which sings and bites—if she, I say, relinquishes the field it is because she is driven from it by a force that is irresistible, there is no choice in the matter.

The metamorphosis of the dragon-fly and the mosquito were unknown to Almy, and he listened to a discourse on them with great interest, but when I brought in a lot of enormous frogs, dressed and cooked them, he looked disgusted; but after seeing the polish which I put on their bones he sampled them, and I had the satisfaction of teaching a man who lived near the great Southern marshes to eat their greatest delicacy.

Somehow we had avoided the subject of voodooism, just as you avoid mention of politics when you know that your friend doesn't agree with you, and it seemed to me that a belief in the supernatural powers of some old colored woman was part of his religion, and recalling the fact that my own New England ancestors, two centuries ago, believed in witchcraft and preached against it made me lenient on this subject. He was a poor unlettered man, they were educated clergymen of the Church of England, and he knew as much about it as they did.

In drawing Almy out I found that he came from Tennessee and had drifted South as railroads were built, but his desire to shoot and fish prevented his getting steady employment. As we smoked he said: "Sometimes, in the fall, I hire out to the rice planters to shoot rice birds and go away for a month or two. These 'ere birds come down from the North in great flocks and destroy the rice crop. I take a dozen or more darkies out and try to protect the crop of some planter while the rice is in the milk state. We shoot into the cloud of birds, but it don't seem to stop 'em from coming on. If the flocks come down on a rice field when it is in the milk stage, and they are allowed to feed for ten minutes, there's no use to try to harvest that crop, it's been gathered. Of course we pick up some birds and send them to market, and they are fat and fine. You mightn't believe it, but they get so fat that they can hardly fly, and in some places the darkies hunt them with torches and clubs at night and send thousands of dozens to market. The light blinds them and they flutter down, too fat to fly, and are picked up by hand or killed with a switch. In the winter the birds thin out, the rice fields give no food and they scatter."

Ah, me! And this was one of my favorite song birds, the bobolink! In the North the male is handsome in its summer plumage, and its hilarious song has been likened to "striking the upper notes of a piano at random." In boyhood days I have shot them, and I hope to be forgiven. In New York markets they are called "reed birds," and I wish to say that I never bought one, but have on several occasions sent the birds back untouched—on principle—when they were served at formal dinners. If the Southern rice planter finds it necessary to kill the bobolink as an enemy to his crops, no man can object; he has a right to do it; and then you will please remember that the male bird is in sober gray feather, and has no song to cheer the rice planter when he devastates his acres. That shows the reverse of the picture.

The Hallock game code, recently published, puts these elegant song birds among those which should not be protected, and I protest! A short time ago a Southern clergyman, resident in New York city, was fined for shooting robins, and in defense said he "did not know that they were song birds." He was right; no birds are song birds after the mating and breeding season has passed; then the males change plumage and only use call notes.

For the benefit of my Southern friends, I wish that they could know the "villianous rice bird" as we know it—sailing over the meadows with its wings in a tremble of nuptial joy and pouring forth its soul in a song that the mockingbird could not imitate. Some poet has written a song beginning:

"Tinkle, tinkle, Mr. Nincomb,
I am merry Bob o' Lincom."

But that was a merry song, and not at all to my purpose. There was another one which treated of the bird and gave words to its song, among which were "winter seeble," and went on to relate its death by a gunner. I would surely inflict the quotation on you if it was on memory's shelf, and therefore you may rejoice. Bryant has given the bird fame in his "Robert of Lincoln," and there we rest the case of this particular bird and go back to the swamps of Louisiana.

We got some frogs to take home, some new minnows to put in alcohol, and then a darky with his mules took our dugout to the railway, and so on "home" to Tangipahoa. Bell and Pete met me at the station, and the darky opened his eyes when he saw the frogs, and as he preceded us to to the hotel he sang:

"Sittin' awn de po'ch in de light ob de moon,
I took de banja down fo' to play a little tune;
De grasshoppas sing an' de crickets all dance,
De frogs try to jine 'em, but dey didn't get a chance.
Den get along, gals, doan yo' see me comin'," etc.

FRED MATHER.

ARE TROUT GROWING CRAFTIER

Editor Forest and Stream:

Did you ever know of a true angler who felt that his life was rounded out, unless when his hair had become gray and his step less buoyant he could once more visit the stream he had first waded and where he felt the thrill which he enjoyed as he took his first trout with the fly? And did you ever notice how frequently after years of experience he looks for the same success he enjoyed when a novice, and departs sadly disappointed, perhaps never to return?

It is true that every pool is there just as it was, and every boulder is as familiar to him as when he slipped and slid around them or fell over them in his youthful enthusiasm, thirty or forty years before, for he could not forget them if he would; even the gurgle of the stream is familiar to him and seems more sweet than any he has heard since.

The hills with their wealth of laurel or rhododendron were never so beautiful in his eyes, for to the angler the love of nature grows stronger every year.

Thus far he lives his early experience over again, and here he stops.

It is true that the stream has not the flow of water it formerly had. The trout have become depleted from different causes, but this depletion should reduce his catch only proportionately; for with one-fourth or one half as many trout in the stream he should, with his present skill, bring back in his creel at least one-fourth or one-half as many as formerly.

The same ground is gone over, each pool and rift is fished with a skill unknown forty years ago, and yet a fish is rarely taken fit to put in the creel.

When the sun is low and the mountains cast their deep shadows over the valley and stream a few trout are taken, but not as they could be taken in the evening fishing years ago.

If the angler thinks that perhaps the stream is too low, yet if he waits till a generous rain raises it to its former state and tries again, he will have but little better success.

If this is not the experience of all, it is certainly that of most veteran anglers who have returned to fish the streams of "their first love."

The question arises: What has caused this change? And there seems to be but one answer.

In streams which are constantly fished the trout of each generation become more shy than those of the preceding one, and they transmit this increased shyness through their ova to their young, that is, the young fish begins where the parent left off.

Forty years ago the large trout were quite as easy to catch as the small ones, and now it is as difficult to catch a fingerling as a large fish.

This increased shyness must then have been born in the fish and therefore transmitted by the parent fish.

The above views have been given on account of a question asked by a scientist in England a few weeks ago, and which was substantially this: Whether the apparently increasing intelligence of some kinds of fish is the result of a greater instinct or because fishes may possibly have the power to communicate with each other by a sort of fish language, and he asked for replies to his question.

Every angler who has made as frequent and thorough tests as the writer knows that fishes cannot hear any sound emitted above the water, although it has been suggested that they may be able to hear sounds emitted beneath its surface; and if such is the case, then if there is any force in the suggestion made by our English friend, we may fairly assume that when some successful angler deftly drops his artificial fly at the head of a pool, some wily trout, which has barely escaped an unwilling translation into the realms above the water, will rush around the pool and whisper into the ears of the other trout which have not learned wisdom by a like experience, telling them that "that thing is a delusion and a sham."

Until further light is thrown on this subject we prefer to adopt the theory that the increasing shyness of trout is simply another illustration of the fact that the law of heredity applies to fishes as well as to animals. J. S. V. C.

POUGHKEEPSIE, March 17.

A Record Mahopac Bass.

IN the FOREST AND STREAM space at the Sportsmen's Exposition was shown a small mouth black bass, loaned by Messrs. Wm. Mills & Son, which was the occasion of much interested comment. The fish was taken in Lake Mahopac, Putnam county, N. Y., on Sept. 7, 1896, by Reuben Miller, a guide and farmer. Mr. Miller was fishing at the time near A. H. Dean's Dean House, and his bait was a 7in. perch. The bass weighed 8lbs. Shortly thereafter Mr. Miller took several other fish of the same species, weighing from 5¾ to 7¼lbs.

The taxidermist has given the big fellow a yellow eye; but by nine out of ten black bass fishermen no notice of this peculiarity of the mounted specimen would be taken.

Aughvick Club House.

COWAN'S GAP, Pa., March 21.—The club house of the Aughvick Valley Fishing and Hunting Club was destroyed by fire supposed to have been started by an incendiary. United States Senator Boies Penrose, Speaker Boyer, Congressman Mahon, Pension Agent George W. Skinner and a number of prominent Philadelphia and Pittsburg politicians are members of the club

SOME BASS RECORDS.

CINCINNATI, O.—*Editor Forest and Stream:* In November of 1896 a small-mouth black bass, weighing 7lbs. 2oz., was taken by Robert Bartells, of Somerset, Ky., in the Cumberland River at Punkin Hollow Mill, six miles from Burnside. He used a Bristol steel rod of 10oz., a Natchaug silk line and a silver reel of his own make, and a live minnow for bait. It took him just eleven minutes to bring it to net, and while battling for freedom it fought with the vigor of a three-pounder and jumped five times out of the water.

It was kindly sent to the Cuvier Club by the fortunate piscator, and has been very skillfully mounted by our taxidermist, Prof. Drury. Really it is not a very gracefully proportioned bass, for overgrown fish seldom are; but it has the strong, muscular proportions, broad tail and razor-like fins which make this fish the royal king of the rocky reefs. Mr. Bartells has given me a catalogue of the catches he made last fall of the small-mouth black bass in the picturesque Cumberland, and it runs as follows:

Oct. 1—Thirty bass, weighing 40lbs., from 1 to 3½lbs.; eight of 3lbs.

Oct. 7—Forty-two bass, weighing 69lbs., from 1 to 3lbs.

Oct. 15—Sixty-four bass, weighing 84lbs., from ¾ to 3lbs.

Oct. 26—Eighteen bass, weighing 26lbs., from 1½lbs. to 7lbs. 2oz.

The next largest I have heard of, and that is authentic, is the one caught by Capt. H. H. Tinker, of the Cuvier's, in Lake Erie, near Put-in Bay, weighing 6lbs. 2oz.

There was one caught, which to be in unity should have preceded the above, at the mouth of the Grand River by J. O. Sawyer, of Grand Rapids, which weighed 6½lbs., and was a royal beauty of its mail-clad race, being perfectly symmetrical from head to tail, and a fighter that came near gaining its liberty.

Now comes John L. Stettinus, of this city, a very enthusiastic angler, who about a decade ago caught one at Put-in Bay that weighed 6lbs. So overjoyed was he with his prize that he at once discontinued his sport, packed up, and hurried home. On his arrival he forthwith gave a supper to a few of his most intimate friends at the St. Nicholas, which cost him an even $100. He now angles for striped bass at Cuttyhunk Island nearly every season, and is very successful at it.

A short time ago Col. W. B. Smith, of this city—and a royal good fellow, too—was up at Green Lake, Wis., angling for the bronze-backers, and while there heard no end of talk about the capture of 7 and 8lb. small-mouth black bass. Wishing to secure some of the big fellows, or else fracture the romances so freely related, he posted up a notice offering $200 for an 8lb. small-mouth black bass, $150 for a 7½-pounder, $100 for a 7-pounder.

This, he said, was the last he heard of the big bass, and he thinks the notice is there yet, and if so, will adhere to the offers he then made.

We hear of a great many big black bass being caught, but they are generally weighed on their own scales, and with enlarged optics.

Of the big-mouth bass there are many that run up to 12 and 15lbs., if not over. We have one in our museum that weighs 13lbs., and was caught in Southern waters, but the 7lbs. 2oz. small-mouth black bass of Mr. Bartells is the largest we ever heard of that was caught by hook and line.

ALEX STARBUCK.

LATER.—I have another big small-mouth black bass for your record, weighing 7lbs. 1oz., that was caught in Honey Creek, a tributary of the Little Miami, that pours into the Ohio River some ten miles east of this city. It was caught a few years ago by Attorney G. W. Hardache, formerly one of our State senators. He is an enthusiastic angler, and takes his outing every year for that bull dog fighter of the rocky reef. ALEX STARBUCK.

ONE DAY'S SPORT.

ALL our writers, with that happy faculty, inherent in all humankind, of losing sight of the disagreeable incidents in the pleasure of recalling the enjoyable happenings connected with an outing, present the bright side only.

At the risk of being designated a crank, dyspeptic or pessimist, I intend to depart from the beaten track and relate a little experience illustrating the opposite side of the question, feeling sure that many of the brotherhood of sportsmen will recognize a true picture of the discomfort that in some form has fallen to their own lot.

It was at Andover, Me., where I was spending a two weeks' vacation in company with a friend, Mr. C. O. Poor. Sept. 30 being a rainy day, we made arrangements to drive on the following morning to the south arm of the Rangeley Lakes, sixteen miles distant, to try for some black ducks, a large flock being reported at that place.

We were up early, eagerly scanning the sky, which showed favorable signs of clearing, and congratulating ourselves on the prospect, we hastily harnessed, got our traps together and started; so did the rain. But having got under way, we made up our minds we would finish the trip, rain or no rain, at the same time hoping that it would clear up.

With intermittent energy the rain continued, however, until we had reached our destination; in the meanwhile securing a grouse which ran from the road into the bushes, where, after vainly shooting in an attempt to make it rise in self-defense, I was compelled to blow its head off at a distance of about 20ft.

Arriving at the lake, and putting our steed up at a shanty near the road, we procured a boat from Mr O. S. Syke, who has charg of the South Arm Hotel, and had nicely started across the lake when the rain commenced to fall in volumes that would have caused Noah to put in a couple of extra life preservers

We pottered around the lake for a little while, seeing but one duck. He flew into a little cove and mysteriously disappeared, for although following directly after him we could not find a feather of him.

By this time we were thoroughly soaked, and concluding that we had ducking enough in both senses of the word we landed and prepared for the homeward journey.

With clothes wet and clammy, sixteen miles in a cold rain, mud 6in deep, an old horse, open wagon, harness breaking twice, causing delay in repairing it, and you have a description of our four hours' ride.

"It is not all of hunting to hunt," and if one does not believe this saying, let him take a trip like the above and he will be convinced.

I was so thoroughly convinced during that ride that on reaching home, or rather Andover, I packed my grips, intending ake he first train to New York the following

day, inwardly resolving that this should be my last shooting trip. But after a smoking hot supper and an evening passed before a grand old fireplace with one of Andover's fairest daughters, wiser counsels prevailed, and I concluded to remain to the end of my allotted time.

Amply was I repaid for so doing, as, taking the same route under more auspicious circumstances a few days later, and camping at the Upper Richardson Pond, we spent the pleasantest days of the season.

If the editor does not think this account of the unpleasant portion of a sportsman's outing disqualifies me from the ranks of true sportsmen, who in theory should be above such trivial annoyances, and refrains from consigning this narrative to the tender mercies of the waste basket, I will furnish an account of the pleasurable part of the camping experiences of two novices.

I must confess, however, that I am no lover of discomfort, even though it be in the pursuit of my favorite recreation.

A BANK CLERK.

"Angling Talks."

WE have a very few copies of George Dawson's "Angling Talks," a series of chapters of entertaining chat about men, fishermen, fish, fishing and fishing places. Cloth, 50 cents. Forest and Stream Publishing Co.

THE INHERITANCE OF MUTILATIONS.

VERSAILLES, Ky.—Since the publication of Dr. Lockwood's experiments in breeding tailless mice, it rather seems accepted as true by the profession that a mutilation has but to be inflicted on an indefinite number of successive generations to insure its heredity. While this is indisputably proven regarding mice, yet facts within the observation of all cause one to doubt whether the same is true with other animals. The dehorning of cattle has been practiced for quite a time, yet I have known no hornless offspring of dehornutated ancestry. My own family has occupied the same lands for nearly a century—four generations. Each in succession has marked hogs with the same mutilation of the ears Yet none has seen a single pig born with mutilated aural appendages. And it is conceded that our stock hogs are of the same general ancestry on one side, improvement being sought by changing the sire, which also invariably suffered the same mutilation.

The custom of cutting off the tails of young lambs, which is as old as the settlement of this State, was brought hence from Virginia, where it obtained since her colonization, coming thence from England, extending I do not know how far back—at least to the era of Little Bo-Peep. I have made careful inquiry of both breeders and buyers of sheep, and have learned of but two instances of lambs born without tails. Since I have myself observed more than a like number of tailless calves at birth, I fairly reason that these were freaks of nature rather than instances of the heredity of mutilation.

These examples afford fair grounds for belief that the mouse is less tenacious of racial characteristics than any other of the lower animals affording means of observation regarding the transmission of mutilations, if indeed they do not absolutely show that the inheritance of mutilations is a legacy peculiar to the mouse among all the lower animals. That there is no such inheritance in the human race we have a proof as indisputable as can be imagined.

While the inheritance of mutilations seems exceptional, and even disproven regarding many animals from fairly extensive observation and experiment, the transmission of mental impress is much more susceptible of proof. Mr. Railey, a noted horseman of this county, had a mare and a stallion both well trained in the "high school" and "park" gaits. Their sires probably had received the same education; I know nothing as to their dams I have seen a colt of these two go "high school" in the pasture of his own free will and inclination, before he ever knew bit or rein. The sire in question became the property of Mrs. Joe Emmet, and is, I think, to be seen in your city to-day.

Another instance of this kind of heredity has been seen by all. What is known as the "pointing" or "sitting instinct" in dogs is but the development through heredity of that ecstatic pause that the presence of quarry excites in beasts of prey. It is to be observed to a slight extent in all members of both the dog and cat family. The pause or "crouch" of the lion or tiger before springing is not so much for pose of limb for that purpose as it is the transient hypnosis from imminence of prey. This hypnosis of sight or ecstatic expectancy, developed by education and fixed by heredity, is surely the most reasonable explanation of the distinguishing characteristic of our bird dogs It has had no development in the cat for sufficient reasons. She is the most uncivilized of all domestic animals. What she originally was and what she is now are one and the same, except as influenced by environment. The cat is unsusceptible of education. Such things as further her physical needs she takes advantage of, not from the influence of man, but merely as she would have done had she found the same conditions in nature. As I have seen elsewhere mentioned, she will rub her back against a man's legs as formerly against a tree, prefers the shelter of a fireside to that of the forest, food freely bestowed to the chances of the chase; but in native instincts she is in no wise changed or developed from her aboriginal state, and even in color constantly tends to the mottling of the mingled lights and shadows that proved her protection in the pristine forests.—*S. M. Worthington, M.D., in Medical Record*

[The learned gentleman may be very strong on lambs, mice, dehorned cattle and horses, but he is weak on dogs and cats; and his knowledge of the hypnosis of the tiger and lion is open to question.

The purpose of the dog in capturing his prey is to secure a food supply. He is a superficial observer indeed who would claim that the tense muscles and intent alertness which obtain during the moments the dog endeavors to locate his prey by his sense of smell indicate a state of hypnosis. The extraordinary agility displayed by the dog in his effort to capture his prey so soon as he has located it proves that pointing is but a preliminary pause for information and preparation to spring and capture.]

AN IMPROMPTU FOX HUNT.

ILION, N. Y.—*Editor Forest and Stream:* Probably the reason we hear so little of the beagle outside of field trial reports is that the owners of those grand little dogs are kept too busy following them to write of their sport. No one who has spent one day behind good ones will class them with the prize-juggling spaniel. Other dogs have had their historians telling of the rare sport of some days' hunt, but the praises of the beagle have yet to find a competent chronicler.

Probably the most interesting hunt we have had this fall is our impromptu fox hunt, although we have had many rabbit hunts and succeeded in bagging quite a few. We left Ilion about 4 o'clock in the morning and did not arrive at the hunting grounds till after 9, quite a trip for a rabbit hunt, and all the way on the cars too. We turned the dogs loose about 9 o'clock and at 11 we had not seen our first rabbit. The dogs would start them all right, but the snow was light and very dry and it seemed impossible for them to hold the scent for any distance. About 11 o'clock, as we were crossing a ridge between two swamps, Dime, the pride of the pack jumped a fox and away she went, closely followed by Bessie and Dime's Dolly. Dime was originally used to hunt foxes and she never loses a chance to give one a race unless she is too busy with rabbits.

The noon sun was warming up the snow and made the running fairly good. The way those dogs made that fox run was a caution, and for just four hours and twenty minutes they kept him going.

Soon we heard a short, sharp bark quite near us, and Saxby said, "There! they have put him in his hole." He then fired his gun to call in the dogs. Soon we saw Dime come out of the woods and across the open ground toward us, with Bessie close behind. One of the party said, "I don't see Dolly She must be lying down somewhere on the track." He probably thought so from the fact that she was between four and five weeks in whelp. But Saxby said, "Don't you worry about Dolly; she has got to have her bark in the hole too. She isn't far away." Soon he said, "See that!" We all looked where he was pointing and were able to see something white moving above the top of the weeds. It was Dolly, and she had her flag up too.

They are all small dogs. Dime is just enough over 13in. so she has to run in the 15in. class, and Dime's Dolly and Bessie are both in the 13in. class. They all ran at Oxford, Mass., at the field trials last November.

Little Dolly has run her last race. She died while whelping last month, and no dog in the pack can take her place. She was the most promising puppy of the lot and the pet of all who knew her.

After we had disposed of the fox or rather after the fox had disposed of us, we repaired to the swamps, and soon had the rabbits going in great shape until darkness compelled us to think of home. Do you suppose you could get those dogs to come in? Well, I think not. We had to catch every one of them and put them on the chain and fairly drag them away. Now let some other admirer of the beagle tell us what their dogs have been doing this fall, and let the public know that the staunch little beagle is capable of giving as fine a day's sport as his severest critics demand. What is more inspiring to the true sportsman than the music of the beagle orchestra in full cry, even if he don't get a rabbit.

J. D. R.

FOX HUNT IN UPSHIRE'S NECK.

VIRGINIA.—*Editor Forest and Stream:* The Only and Mappsburg packs, after recuperating from their heavy run last week in Hack's Neck, again came together to-day, in order that the important sporting matter might be fully settled as to the best qualities of their respective packs. The points to be considered were speed, staying qualities, strain of blood, and greater degree of skill in readily finding the track when coming to a check, besides many other fine point that go to make up an animal fit for the enjoyment and sport of man.

The hunt was one of great excitement, though it did not last near so long as hunts frequently do. From the time of raising the fox until his capture was 2 hours and 59 minutes by the watch.

To give a better idea of the hunt made to-day, it seems important before going further to give a brief description of Upshire's Neck. This is a long strip of narrow, very rich farming land laying between Matchapungo Creek and Hog Island Bay, some ten to twelve miles long and averaging about a mile in width, abounding in small game, with plenty of red foxes in addition.

We raised the fox on the Davis farm at 7 A. M. about five miles from the south end of the neck. The dogs were as gay as larks, and went straight for reynard at a terrible rate of speed south, the riders following, but failing to keep in distance, the dogs running two lengths to their one. The point of the neck reached, the fox doubled and was met running north, making fine time, leading perhaps by a half mile. The pack was up almost instantly, well together, passing us as it were a shadow, so to speak, at which stage of the hunt two black and tans belonging to the Mappsburg pack and two of the Only pack were the first to mount the inclosure of the Fentress farm. Ames's bitch Music and one imported were the next. The dogs were soon out of sight and hearing, the riders following at all possible speed.

When some five or six miles north we met the fox that had been out of the neck. As was afterward reported, he made a circle of perhaps ten miles through the country, and was returning again down the neck, in fact, was already on the Bowdoin farm. At this stage of the hunt, an hour and a half having already elapsed, there was but trifling odds beween the dogs and the fox. as between then and when last seen, the latter showing no signs of distress, while the dogs were well packed, running with great speed, making the damp atmosphere resound as it were the rushing of mighty waters. It is not possible for one not there present to witness the sight to realize this grand exhibition of the efforts of pursuers and pursued. The first were obeying the laws of instinct without the possibility of gain, while the other instinctively knew that his only hope of escape depended upon the means given him by nature—speed and endurance.

The dogs passed on south, where the fox again doubled at the point, following the Broadwater shore north to the Bowdoin farm, where being closely pressed—the hard turf giving the dogs better foothold—he shied from his course and crossed the Bowdoin farm; this being the first time, to our knowledge, that the dogs had sighted him. Even now he was seen only by the leading dogs, and was too far away to perceptibly accelerate their speed.

The chase continued to offer every interest connected with the sport, the dogs going north up the neck, crossing farm after farm, and the horsemen in full pursuit. Passing again out of the neck, the fox made a circuit, as before, and finding himself hard pressed was soon back again. On sighting him we found that he was badly broken up, exhibiting a strong tendency to "linger." The two black and tans had, unfortunately, been ripped almost to their vitals by a barbed wire fence on the north run, and were not with the pack, but the rest were making good time and quite well together. None had stranded, while it was apparent that the chase was now drawing to a close. But a short time elapsed before a black and tan bitch belonging to Ames had the credit of being the first to pass sentence on poor reynard. The entire pack, however, must have been close up, as the fox was torn into jiblets

The same grounds will be hunted on Wednesday next

T. G. ELLIOTT.

Dogs for Packing in Alaska.

SOME time ago an Alaska trader visited the city looking for dogs. He spent several days here, and left with six lusty canines which he had purchased at very reasonable rates. He said he wanted the dogs to take to Alaska and make common carriers of them, dogs being the only animals that can stand the grief of a trip up the Yukon, and be good for anything when they get there. Eskimo dogs are, of course, preferable for this purpose, being intended by nature for such use, but Eskimo dogs are scarce and expensive, so ordinary dogs are used to take their places and answer very well. All that is required is a long-haired dog big enough to haul his share of a sledge, and sufficiently young and intelligent to be capable of learning the business. Such dogs command a good price, a fact which many men who are now working extra hours for money to feed household pets will be glad to learn. There has been more or less inquiry for dogs in Portland and the cities of the Sound every spring. This year, however, the development of the mines on the Yukon has taken so many miners into the mining district that the demand for pack animals is greater than ever, and the dog market is likely to be very brisk before long.—*Portland Oregonian.*

Pet Dog Club.

EAST ORANGE, N. J., March 18.—*Editor Forest and Stream:* At a meeting of the American Pet Dog Club, held at the Hotel Lincoln, Broadway and Fifty-second street, New York city, on March 10, the club elected as its judges for the ensuing year Messrs. Morris, Rackham, Mortimer, and Miss Whitney, and as delegate of the American Kennel Club Mr. T. Farrer Rackham, East Orange, N. J.

Three new members, Mrs Anna Bernstein, Mrs. Marie Barth and Miss Sophie Barth, were elected and ten new members were proposed. Other business of importance was transacted and the club is in a most flourishing condition.

T. FARRER RACKHAM, Sec'y.

POINTS AND FLUSHES.

A Pittsburg friend kindly sent us the following clipping, which recounts the devotion and intelligence of a dog: "Thomas Cain, residing on Hamilton avenue, Brushton, his wife and three children were saved from burning to death early yesterday morning by a dog. Fire broke out in the house about 4 A. M., when they were asleep, and they were only awakened in time to make a hasty escape by the dog barking, howling and scratching at the door of Mr. Cain's room. The house was destroyed. It was valued at $2,000, and $160 which Mr. Cain had in a bureau drawer was also burned."

The National Pet Stock Association, organized for the promotion of the interests of the pet stock at fairs and live stock exhibitions, has issued a circular in which it calls the attention of breeders to the need of united action and the success which comes from it. Full particulars can be obtained of the secretary, Mr. G. P. Reynaud, Mount Vernon, N. Y.

Under date of March 17, Mr. Thos. Johnson, of Winnipeg, writes feelingly of his friend: "Only those who knew the late A. P. Heywood-Lonsdale intimately knew what a great, big, kindly heart he had. Manly sports have indeed lost a friend. The Shropshire hounds, which he had kept and hunted at his own cost, and English field trials have lost a most beneficent encourager and supporter. I cannot better illustrate his kindheartedness than by quoting a line from a letter he wrote me when Mr. Braelsford last came to this country with his dogs; he said: 'Mr. Braelsford, as you know, is getting well up in years. Please, Mr. Johnson, do all you can for him to make his labors as light as possible, and spare no expense in doing so.'

"When I think of Mr. Dexter, Mr Lorillard, and other great American sportsmen—and wish we had more like them—and then, when I remember Mr. Lonsdale, I don't think it any reflection to say, 'He was the greatest Roman of them all.'"

Mr. G. B. Borradaile, Honorary Secretary of the Manitoba Field Trials Club, Winnipeg, has sent out the following information in a circular letter to the club's patrons: The following arrangements have been made in order to prevent expense, trouble or delay at any of the customs ports of entry, viz.: Neche, Pembina and Gretna. All dogs that have been duly entered in any of the Manitoba Field Trials Club events are allowed to enter Manitoba and remain for ninety days free of all duty. In order to benefit by this arrangement, an accurate description of each dog, giving name, breed, sex, color, event entered in, owner's name, name of person having charge, and line of railway traveling by, must be mailed to C. G. Borradaile one week previous to date of arrival at port of entry.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the atest by Monday, and as much earlier as practicable.

Docking Dogs.

SOME time ago a special committee was appointed by the Kennel Club to inquire into the method and procedure in the matter of "docking" or cutting the tails of dogs, specially with reference to the old English sheep dog and the schipperke. Of the latter it had been said that the tail was not docked or shortened in the fashion usual with terriers, but when it was born with a tail on the entire appendage was torn or gouged out, in order that it might appear to have been originally produced without a tail. Unscrupulous dealers sold such dogs as naturally born tailless and led their purchasers to believe that all schipperkes, if "thoroughbred," were so born. No doubt considerable cruelty in this docking was practiced on the schipperke, although the members of the English Schipperke Club disputed the charge, to which they gave an "emphatic and unqualified denial," saying that "a greater calumny had never been uttered against a respectable body of fanciers." In their memorial to the sub-committee, already alluded to, and a meeting of which was recently held, they prayed that the docking as practiced in their humane manner should not be interfered with.

There is no doubt that "gouging" or "carving out" the tails was in practice in Belgium, the home of the variety, but that if it had ever been done in this country such a case had not been known to the club; its members were, moreover, quite willing to fall in with any suggestion toward stopping the practice where it existed. The chairman of the sub-committee pointed out to delegates representing the two English schipperke clubs that their description of the dog stated explicitly "that the tail of the schipperke should be absent," and this not only induced its breeders to remove the whole of the tail, but such a statement was calculated to lead the public to believe that schipperkes were born without tails. Considerable discussion took place, and in the end the delegates of the English Schipperke Club and the St. Hubert Schipperke Club adopted the following memorial to the Kennel Club: "The members of the above clubs, with a view to the settlement of the docking question, have agreed to the following alteration in their rules and standard of points, namely, to substitute and add to the description dealing with the tail the following words: 'Tail, if not naturally absent, may be docked, and a stump of 2in. is not objected to; but "carving" or "gouging out" is not permissible, and shall disqualify.'" This was signed by Mr. B. W. Moore and Dr. Freeman, the delegates, and it will be laid before the full committee of the Kennel Club in due course.

No doubt the agitation had arisen on account of what had been practiced on the schipperke, but as a representative of the old English bobtailed sheep dog had been invited to the meeting in question, the club in its interests was represented by Mr. Parry Thomas. The chairman, Mr. J. W. Ross, pointed out that at a general meeting of the Kennel Club it was stated that the practice of gouging or carving out the tails of schipperkes and old English sheep dogs was common; that such a practice was obviously a cruel one, and that in consequence of this the sub-committee had been appointed. The meeting was prepared to receive and report whatever the representatives of the clubs present by their delegates might wish to place before them, and in framing their views he would remind them that they must not lose sight of the fact that there were gentlemen in the club who advocated the entire abolition of docking in any shape; in fact, one member of the sub-committee, Mr. Edgar Farman, held a strong view in favor of its total discontinuance. The whole matter would be laid before the full committee of the Kennel Club to be dealt with. Mr. Parry Thomas, in stating the view held by his club, emphatically denied, on behalf of his colleagues, the allegation that old English sheep dogs' tails were either carved or gouged out, and that to leave a stump 1½in. or 2in. long was an improvement rather than a detriment. He had not come prepared with any written statement, but was quite ready to reduce the substance of his remarks into writing for the use of the committee. His club were prepared to pass a rule so as to prevent the possibility of such a practice as had been alluded to being resorted to in connection with the old English sheep dog.

Wheeling.

In a Flat.

IN the appartment house in New York where I live there are six flats, all occupied by small families, with in no case more than three adult members. Yet there are nine bicycles in commission at the present time, with prospects of two more to be added in the near future. More than 50 per cent. of the occupants of the house, including both sexes and all ages, are riders, and practically all the able-bodied adults are embraced in this classification. Besides the bicycles, the rolling stock of the flat includes two baby carriages and one child's tricycle.

Our flat is not one of those "go-as-you-please" apartment houses. It is conducted on the principle that wheeled vehicles, like dogs and cats, must be subject to carefully drawn up rules. The legislation in this particular instance requires that they shall be left in charge of the janitor when under the communal roof, and under no circumstances shall they be taken to the individual apartments of their owners to imperil wall paper and track up the halls.

This rule, while not especially obnoxious to the tenants, has given the janitor in question some sleepless nights. Last year he only had four bicyles to look after, and found ample room for them in the passage to the coal bins, but with nine and the prospect of two more in a few days things are different.

To accommodate the nine he has fitted up with racks a storeroom that formerly came in very conveniently for some of his own personal needs; but as it is, the place is overcrowded and there is not room for a single additional wheel on the floor.

Fortunately the room has a high ceiling, and the janitor hopes to solve this riddle of domestic economy by persuading some of the wheeling contingent to suspend their bicycles from above. The two newcomers are to have drop-frame wheels, and as he couldn't ask a lady to take the less desirable position, he is using considerable diplomacy to make some of the original male preëmptors of desirable spaces see the desirability of moving higher. To help out his scheme he says he will call those who elevate their wheels the "athletes," as distinguished from the "cripples," who use the ground tier.

He will also throw in one free clean up for every one of the upper story wheels, and guarantees that the tires will last longer, as they are relieved from the weight of the wheel for the time being.

With us the cycling season began Feb. 21, and wheels that had not been ridden since Thanksgiving came out that day.

Only two bicycles were in commission all winter, but there was remarkable unanimity in bringing the others out for Washington's Birthday. DAN DALY.

Ran into a Deer.

A YOUNG woodsman had a curious adventure the other night in the wild woods of Morehouseville, up in the Adirondacks. He was riding along the road on a bicycle. His lamp was lit, and the light it threw was powerful.

Suddenly in the road ahead, half way down a hill, a form loomed up in the light thrown by the lamp. Two turns of the pedals showed that it was a deer, which, hearing no sound and seeing nothing but the light, had been literally jacked, as much as ever a deer was jacked from a boat along a backwoods stream. The sight flabbergasted the young man, and then, before he thought to jump off, he hit the deer fair in the side and doubled it up in a heap.

Of what followed the young woodsman has no distinct recollection. He got mixed up some way with something. For a brief instant he felt deer hide under his hands, then something hit him in the side and he went over into a ditch among the briers.

By and by he got up and examined his wheel. The handle bars were bent and some spokes needed straightening. The lamp was dented in several places, but would still show a light, the glass having been untouched. When he got things somewhat straightened out he began to examine the road. There was a place that looked like a deer's rolling place, with the imprints of a man's hand in the middle. A long mark showed where the deer's hoofs had slipped in the dirt. The deer was not to be seen.

Only once before in that part of the Adirondacks has a man succeeded in laying hands on a deer while the ground was bare, and that man was young Frank French, of Morehouseville. A deer was watching Henry Cook one day up on the Indian river, and French, who had no gun, sneaked up behind the deer, and grabbing it around the throat choked it to death.—*New York Sun.*

THE BUFFALO AT VAN CORTLANDT.

NEW YORK, March 8.—*Editor Forest and Stream*: The other day I took a spin on my wheel out to Van Cortlandt Park to see the buffalo which have been loaned the city through the courtesy of the Corbin estate.

The route followed was Seventh avenue to the Harlem River, Sedgwick avenue, Kingsbridge road and Broadway to Mosholu avenue, and then a short turn east on the latter to the north end of the game inclosure. The distance from 155th street is about six miles.

Mosholu avenue has lately been macadamized and the wheeling on it was the best encountered after crossing the Harlem. This is not saying much, however, for the other roadswere in vile condition, owing to heavy travel; and in places where the frost was still in the ground it was much easier to ride over the grass at the side than on the roadway proper.

Mosholu avenue is all that could be desired, from the wheelman's standpoint, even at this the worst possible time of year, and it was a comfort to get upon its smooth, firm surafce and feel the bicycle run easily once more.

The day I had chosen for my trip was not by any means an ideal wheeling day. It had rained only the day before, and a mist hung over the landscape indicating that Old Probabilities still had something up his sleeve in the way of moisture. There was, however, a compensation for the poor roads and sloppy riding in the prospect. To my mind no view is so charming as when it is given the imaginative cast that comes from a misty atmosphere, which blots out parts of the distance and makes others more suggestive while throwing into relief the foreground and middle distance. A clear atmosphere means death to perspective on any but a vast scale, but with mist the most commonplace landscape assumes unexpected beauties. In England, photographs, owing to the moist, rain-laden atmosphere, and also the appreciation of its possibilities by the photographers, frequently have the quality of paintings and stand in a class by themselves. The main features of the picture are properly accentuated, while the great art of leaving out irrelevant details has due recognition.

I had been keeping a sharp lookout for the buffalo while pedaling along the avenue, which at first passes through a piece of woodland; but not till the open land toward the eastern edge of the paddock was reached did I get a sight of them.

The entire herd, numbering twenty-five great animals, was grouped on a point of the hillside 200yds. away, some standing, some lying down.

As it happened, when I first saw them all were motionless; but presently one old bull, whose herculean proportions were not lessened by the luminous medium through which I saw him, began fighting a small tree with lazy thrusts of his ponderous head. Nearer at hand was a herd of a dozen European roe deer lying close together in a little weedy depression in the open hillside, looking like weather-worn rocks, and suggesting by their clustering proclivities a covey of quail.

A few hundred yards east of where these deer lay was a thick copse, swampy in its lower portions, through which runs Tibbitt's Brook. If the deer had been of our native Virginia stock they would undoubtedly have been found in this cover, and not out in the open within a stone's throw of a traveled road. But the European deer come from a long ancestry of park-bred animals and are used to being looked at. They are well adapted for parks, but in October afoot in the woods I should want different game.

The buffalo and deer are in charge of a Scotchman, who is known as Billy Morrison. He has been bred in taking care of animals in parks, and his charges and he are on the very best of terms. The buffalo cluster about him, and even the monarch McKinley eats from his hand. In America we do not breed gamekeepers any more than we do park deer, consequently we have to import them.

Morrison is afraid that the buffalo will get mired in the bottom down by Tibbitt's Brook next summer. Buffalo, it seems, need a lot of watching in parks, and are constantly in mischief.

Perhaps if we go on with our parks and our buffalo, the descendants of these animals several hundred years hence may be more tractable and more amenable to their environment. It is hard to make park animals in one generation from the stock that roamed the plains and knew no limit to their wanderings beyond the climatic one imposed at the beginning of the world.

With the advance of spring and the coming of better roads the avenues of the northern part of the city will soon be black with wheelmen.

The buffalo inclosure can easily be reached either from Jerome avenue on the east or Broadway on the west, and a sight of the game will well repay any one who has the sportsman's instinct.

How the buffalo will enjoy the opening of the cycling season remains to be seen. J.

The Cycle in the Army.

AN officer in the U. S. Army, and one who has evidently given much thought to the subject, writes the following:

"It seems to me that the War Department has, in its road maps and the continued scouring of the country by cyclists, a means of acquiring a knowledge of roads and of the country such as has never before existed in the history of nations. Many of the officers are most desirous of using the bicycle officially, but its adoption requires the creation of a special body of men and a special appropriation. These can only come through Congress, and Congress should be made to see the necessity. Army officers cannot advise, solicit or attempt legislation—it is against the regulations. The matter should be worked up in all papers. In one trip I covered 780 miles in eight days, examining roads between New York city and Washington, D. C., and the neighborhood of several cities. Returning, I went from Washington to New York in twenty-five hours' actual riding, about thirty-two hours on the road—a distance of 250 miles, or longer than most of the lines crossing the campaign grounds in many great wars.

"There is no question as to the desire to use the bicycle, but our army is small, and all these things come through appropriations. I believe that such a collection of information should be gathered and stored, and that it would prove invaluable in war. All road book information is just what is wanted by troops—kind of road, hills and grades, streams and bridges, taverns, towns and villages, etc. Add to this a very slight description of the country, and one has a mounted reconnoissance map. Much of this information may reach the Government through General Stone, but it would be well to have it reach the army also.

"A light battery marched from Fort Hamilton to a point well up in New York State. Had they then possessed the New York Division maps they would have been very useful, and, in fact, much information was obtained from a district bicycle map on the return march. When I arrived at a post a few years ago, not one of the officers save myself rode the wheel. When I left every one had a bicycle. General Miles takes a great interest in the bicycle, and I know that if it is possibe it will be regularly issued soon."

Out of Date.

THE other day an Irish youth appeared on the Boulevard astride of a machine of the old "hobby horse" type, designed to be propelled by thrusting the feet against the ground. He had probably resurrected it from some forgotten scrap pile, but the fact that it was antiquated and ridiculous did not for a moment seem to enter his head.

The notoriety which he at once achieved, for it was Sunday and the street crowded with a gay throng of cyclists of both sexes, did not feaze him in the slightest degree, and he held his head as high as if he had been riding a wheel enameled with diamonds and rubies instead of mud and rust—the object of envy instead of derision.

The wheels in his machine were a good, long distance apart, connected by a flat, springy backbone, and this he utilized for carrying passengers.

Piloting his machine to a place where there was a sufficient incline for coasting, he took aboard four small boys, three behind hugging each other closely to keep from falling off, and one in front riding on a sort of bowsprit projection that stuck out a foot or more.

One boy ran behind and gave the thing a start, but in his enthusiasm he nearly brought about a catastrophe, for at the last moment he tried to jump aboard himself, and only the most skillful steering of the captain and most desperate clutching and hanging on of the crew prevented a spill.

Later in the day machine and rider took a long run down the Boulevard in tow of boy mounted on one of the old high frame "ordinaries," and seeing the two together it was hard to say which of the prototypes of the modern bicycle looked the most out of date.

A Bicycle Fox Chase.

RATHER a novel experience was enjoyed by two cyclists lately. When out for a spin they espied a fox and gave chase. After a rough ride across country, they ran the fox down, killed him, and triumphantly carried home the brush. This incident, which is enough to lift the hair of all sportswomen with horror, was not after all so terrible as it sounds—because it happened at Serpentine, Australia.—*The London (Eng.) Wheelman.*

Yachting.

As the yachting journal of America, the FOREST AND STREAM *is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.*

BY the recent final decision in the Conqueror case, yachts which sail to this country on their own bottoms are not, up to the present time, dutiable under the tariff laws. This larger class of vessel has recently been specially dealt with by the new Payne bill, which pretends to prohibit their use in American waters when owned by American citizens.

There has been thus far, we believe, no specific provision in any American tariff law for a duty on yachts, but those imported in large vessels have been classed as manufactures of wood, or wood and metal. In the new tariff bill now before the House, a specific duty of 35 per cent. is proposed for "Yachts," but it is not stated whether this is to apply solely to small craft or to all sizes. It makes little difference, however, as after the American yachtsman had paid his 35 per cent. duty he would still have to answer to the new Payne law, under which he could not sail her without incurring fresh penalties every day.

YACHT DESIGNING.—XVI.

BY W. P. STEPHENS.

[*Continued from page 215.*]

THE drawing board, whether a fixed table top or a movable board, should above all things be perfectly flat or a trifle convex on top. The former is the better, but a certain amount of warping can hardly be prevented, and a slight convexity is of little account; a concave board, on the other hand, is something to be rigidly avoided, as the *straight-edges* and *triangles* will not lie flat upon it. The best material for a drawing board is white pine, as it is known according to American usage, the same wood being known as yellow pine in England. It is no longer an easy matter to obtain this wood of the quality required for yacht's decks, models and drawing boards—clear, sound, soft, cutting freely—the wood that the traditional Yankee of a generation back delighted to "whittle." What is found to-day in most lumber yards is hard, streaky and more or less filled with gummy sap. This latter defect is of itself enough to con-

demn the wood for drafting purposes. It must be dry, straight-grained and absolutely free from gum. For mere temporary use a wide board, or two pieces glued together, may be planed up and battened across the back or along the edges; but we do not recommend such a makeshift except for the extra boards that come in handily for small odd jobs when the main board is in use. A good drawing board is a

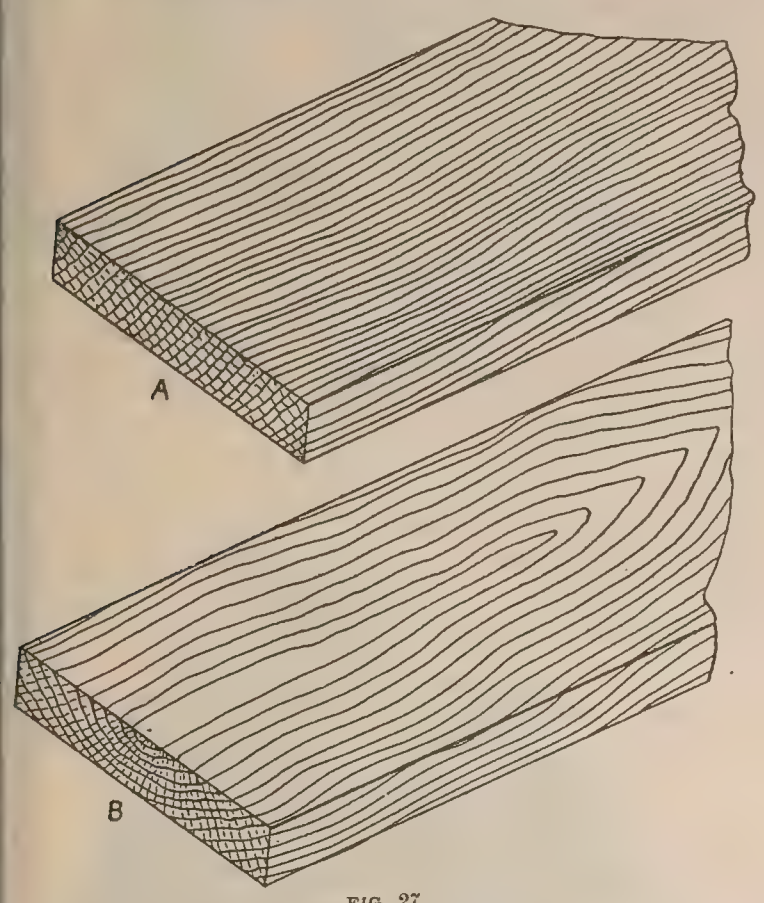

FIG. 27.

A—"Quarter-sawn" or "comb-grain" board.
B—Heart or "leaf-grain" board.

source of joy to its possessor; with reasonable care it will last many years, and in selecting or making one some special trouble to get the best is justifiable. The material should be carefully selected, of quarter-sawn or comb-grain Fig. 27 (*a*) rather than the leaf-grain (*b*). After being dressed on both sides to a little greater thickness than that proposed for the finished board, one side of the board is marked across with a pencil (Fig. 28) and it is then ripped into strips about 2in. wide. The edges of each strip must then be carefully finished with a jointer plane until they are straight and square.

Before gluing together, each piece should be inspected and all arranged with reference to the grain. The first strip cut from the board will be laid with the marked side up; the next strip will be turned over, the marked side being down; and so in alternation through the strips cut from the two or

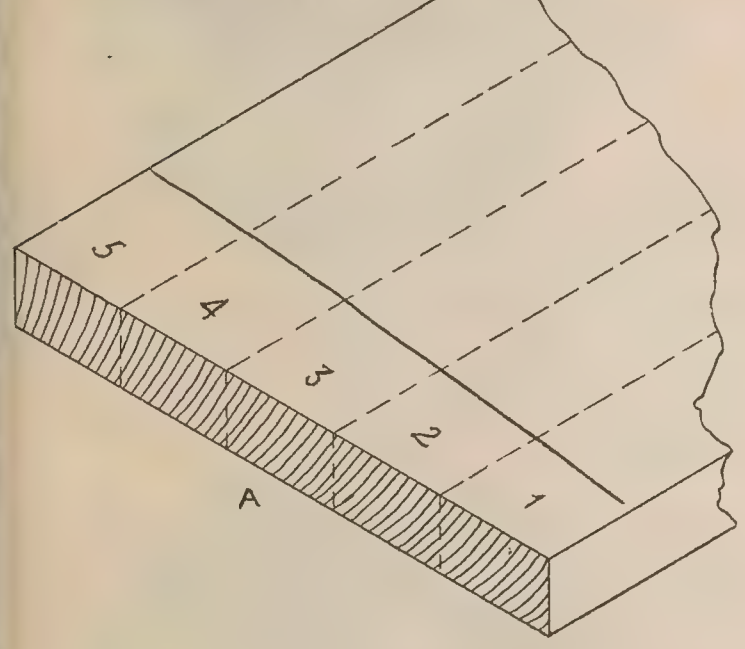

FIG. 28.

A—Board marked for sawing.
B—Strips sawn and rearranged.

three boards necessary to make up the required width. The reason for thus reversing each alternate strip is that the tendency of one side of the original board to warp more than the other will have little effect on the truth of the assemblage of strips when glued up. Now the strips may be inspected as to the longitudinal grain, and the ends reversed if necessary, so that the grain in each piece on the side which is to be the top will run in the same direction. The advantage of this will be seen when it comes to the final planing up of the top and bottom, the plane cutting smoothly without ripping up the grain. Each strip being thus perfectly square and straight and the grain properly arranged, they are glued on the edges, well clamped together, and allowed to dry.

In order to give the necessary strength to the board, as well as to prevent it from warping, cleats are fastened to the back, or some similar means adopted. As the board is certain to shrink in width, some provision must be made in fastening the cleats, one common plan being to cut two dove-tailed gains across the lower side of the board, Fig 29 (*a*), in which a piece of hard wood (*b*) of corresponding taper is snugly fitted. This piece is screwed on top of a deeper piece (*c*), stiffening the board. In shrinking the board slides on the upper strip. To lessen the tendency to warp, a wide groove is sometimes cut in the middle of the lower side of each strip before they are glued up (*d*)

In another style of board, wide, flat battens are used, with screws through them, one screw in each strip. To allow for contraction, the screw holes in the battens are made oblong, and a brass plate is put under the head of each screw, the strips thus having freedom to slide a little distance A round-headed screw, with a common brass washer about 1in. diameter, will answer.

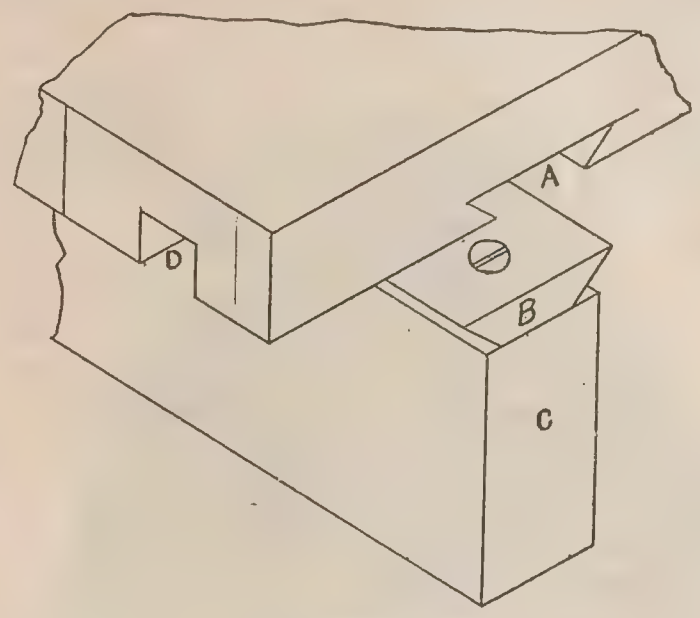

FIG. 29.

A—Dovetail gain in board.
B—Strip to fit dovetail.
C—Stiffening cleat.
D—Grove to prevent board from warping.

To those who, like ourselves, prefer a board with both sides smooth and unobstructed, we can recommend another plan Before the strips are glued together, several straight lines are marked across them from side to side, and holes are bored from edge to edge, long iron screw-bolts being run through these holes, Fig. 30 (*a*). After the board is dry and the bolts set up, two strips of mahogany may be got out, one for the front and one for the back edge; recesses are bored in each to cover the heads of the bolts on one edge, and the nuts on the other, and they are screwed on with ordinary wood screws (*b*). From time to time, as the board dries and

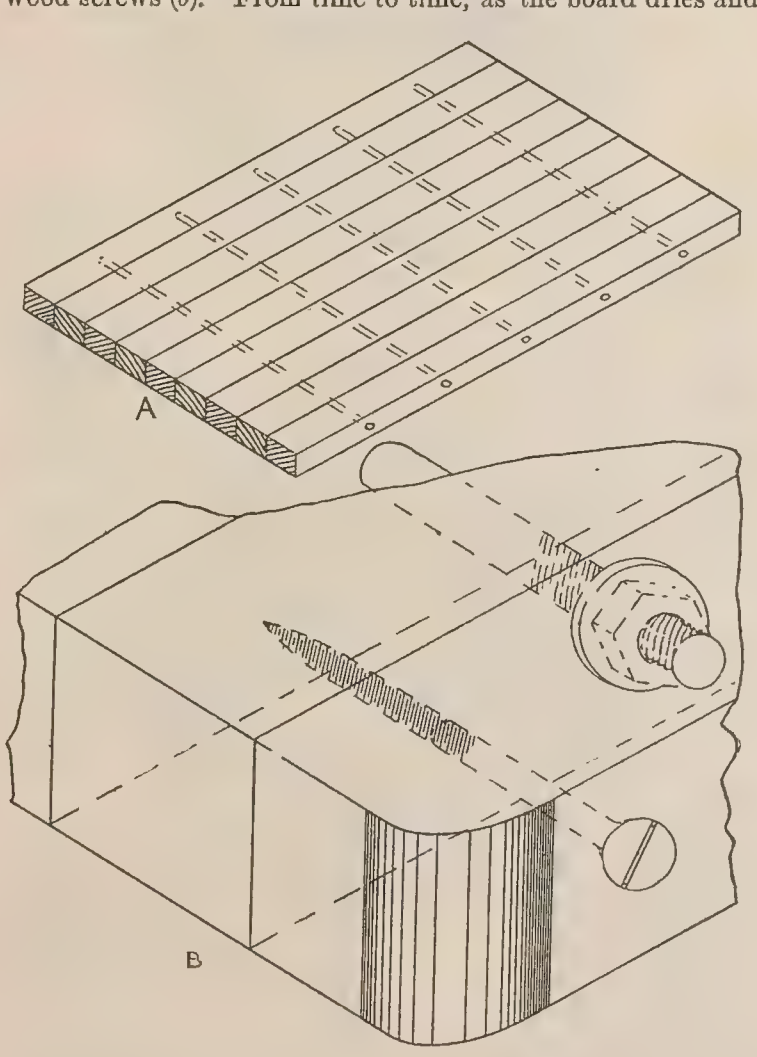

FIG. 30.

A—Board bored for bolts.
B—Corner of board, showing end of bolt covered by outer strip.

shrinks, the strip on the back may be removed and the nuts set up tight. When this shrinkage has gone on, as it will, until 1in. or so of the rod projects beyond the nut, all the nuts may be removed and a new strip of pine added the nuts being set up, and then the mahogany strip replaced. For a board 50 by 30in., five bolts of $\frac{3}{8}$in. round rod, with hexagon nuts, are necessary; for a smaller board, $\frac{1}{4}$in. rod will be heavy enough Such a board is light, and may be used with either side up; if it should warp a little the convex side can be used. With a little care in turning it over from time to time, and protecting it with a cover when not in use, it can be kept quite true.

We have still in use a light traveling board made twenty years ago, 27×20in., and $\frac{3}{4}$in. thick. Instead of the screw bolts, each strip was mortised, $\frac{1}{4}$×2in., near each end, and a strip of sound hickory, $\frac{1}{4}$×1$\frac{3}{4}$ in., was run into each slot, of course not being glued or fastened, except in the first strip, which was of soft Spanish cedar. This board is light and straight and very convenient to handle (Fig. 31).

After a board is glued up and the two sides faced off smooth and true, the two edges are jointed up straight, square and perfectly parallel. Then the ends are trued up at right angles to the edges, making a perfect rectangle of the board. Like the famed exploit of the second mate of the ship Guyascutus, this truing up of the four sides and angles of a board "ain't much of a thing to talk about," but it is likely to prove "a ticklish thing to do;" and when done, the truth of the work cannot be guaranteed for any length of time. It is very nice, in theory, to be able to use a T square at will from either of the edges or sides of the board, knowing that all lines will be parallel or perpendicular; but

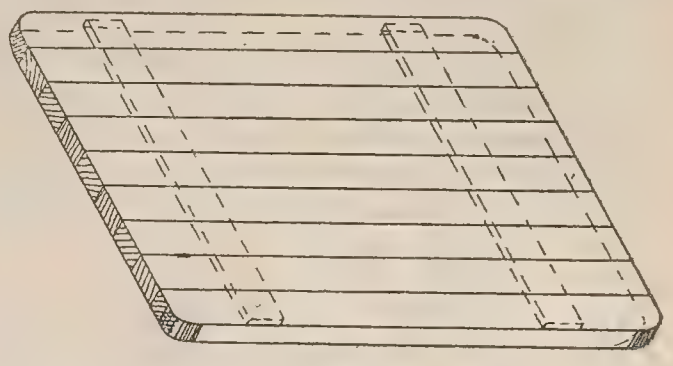

FIG. 31.

Small board with hardwood battens inside.

in actual practice the draftsman may well be content if he can keep the left hand edge and the near side of the board perfectly straight and at right angles, so that his square may be used from either. The corners may be slightly rounded, as at (*b*) Fig 30. The surfaces of the board should never be oiled; they may be left as they come from the plane, or they may be finished with shellac varnish. When they become dirty or roughened in any way, they may be rubbed down with fine sandpaper, using a flat block of wood around which the sandpaper is wrapped. When not in use, the board should be stored on edge preferably in a dry place, but not subject to the direct heat of a stove or the sun. Several small boards of different sizes are desirable in addition to the main drawing board for small work, especially tracings, which may need to be left on the board in position for some time, work going on meanwhile on the large board.

Spalding St. Lawrence Boat Company.

THE new annual catalogue of the Spalding St. Lawrence Boat Company, of Ogdensburgh, N. Y., is a marked improvement in appearance as well as make-up over previous publications of the company, the letterpress being printed in a pleasing shade of green, with a very artistic cover of sage green. The company is this year devoting itself almost entirely to the larger and finer grades of sailing boats and small yachts, and it is to these popular craft that most of the book is devoted. They are described in detail as to model, construction and rig, and a very large number, including all types and many sizes, are listed. The different models are fitted for light or heavy centerboards, fixed or movable fins, etc., according to the intended uses of the purchaser. The rigs described vary in area from those for single-hand work up to the racing 20-footer or larger, and in style from yawl to cat, lugger and sloop.

Among the new models is one that promises to become deservedly popular, an all-round sailing boat, double-ended, 16ft. over all, 14ft. 8in. l.w.l., 4ft. 3in. beam and 6in. draft, an entirely new design with thoroughly modern lines, intended to take the place of the wider canoes and of the skiffs and other rowing boats fitted with sails. She is of course a single-hander and a cruiser, but will carry a party of half a dozen for a sail, and is useful for cruising, sailing, fishing or any similar purpose.

In the way of rowboats all of the best models have been retained and a new one added, a reproduction of the pleasure boat used on the Thames, in England—a very handsome and comfortable craft for pleasure rowing, picnic parties, etc. The company lists a large line of power launches for yacht tenders and of larger sizes, and also the Wing Marine Gas Engine, for which it is agent.

During the past year large additions have been made to the stock of patterns for yacht brasswork and fittings, and the company is now prepared to furnish anything that may be wanted in this line. By special arrangement it is the sole agent in the States for the new fittings made by the Yacht Co. of Canada, as used on Glencairn, Sothis and other 15-footers, these now being made for both 15 and 20-footers. An important addition to the book is found in the many excellent pen sketches of yachts under way. The book is more than a mere catalogue, and may fittingly be classed as a handbook of modern small boats.

The American Model Y. C.

AN interesting feature of the FOREST AND STREAM exhibit was the display of model yachts arranged by the American Model Y. C., of Brooklyn. At the top of the partition was placed the model yacht Star, owned and sailed by George W. Townley, present holder of the club's challenge trophy. On the floor in her cradle was the model yacht Wave, owned by Messrs. Cogswell & Thompson, of the Wave Crest M. Y. C., holder of the *Outing* cup. Both of these were complete sailing models, fully rigged.

The half models were eight in number, of which four are for the 20ft. class competition. One of these, by O. L. Gray was a fin-keel; the other three, by J. C. Meyers, Com. J. H. Lane and Frank Nichols, were centerboards. Two of these models were of galvanized iron and showed very neat workmanship. There was also a display of club flags and a group of portraits of the officers of the club.

The American Model Y. C. has recently received a challenge from the Wave Crest Model Y. C. for a second race for the trophy, which the latter club failed to capture last season. The race will probably be sailed on July 4. On March 28 a race will be sailed for the *Outing* cup; Mabel, O. L. Gray, A. M. Y. C., having challenged the holder, Wave Messrs. Cogswell & Thompson, Wave Crest M. Y. C.

Portland Yacht Club.

PORTLAND, Me., March 19.—Herewith I nclose notice of March elections: The annual meeting of the Portland Y. C. last evening was largely attended. The annual reports of the officers and committees showed that the year had been a prosperous one for the club. Officers were elected as follows: Com., J. W. Bowers; Vice-Com., C. W. Bray; Sec'y, C. F. Flagg; Treas., C. F. A. Weber; Meas., A. M. Smith. Trustees—W. Senter. J. C. Hamlin, C. W. Bray. Regatta Com.—A. M. Smith, R. S Rand, J. C. Fox, W. F. Haddock. House Committee—W. W. Goold, P. I. Jones and J. C. Fox. The total membership is 278, a gain of 28 during the year. There are 67 yachts enrolled, a gain of 3. During the year two bonds have been retired; this reduces the debt to only $550. Hon. W. W. Thomas and J. S. Merritt, Esq., were elected honorary members. The matter of the date of the annual cruise was postponed to the April meeting. The date of the challenge cup regatta for first-class yachts was fixed for June 26.

CHAS. F. FLAGG.

The Skipjack Myra.

WATERVILLE, Me., March 13.—*Editor Forest and Stream:* When I looked through my FOREST AND STREAM to-day and found you had by request republished the plans of Mr. Nason's Skipjack Myra, it occurred to me that perhaps you might like to know of some who had already built from the drawings as first published more than two years ago. I happened to buy that paper and received so much value from it that I have not missed one since, and now consider the FOREST AND STREAM a fixture.

I built my boat from the lines given, and as it was my first attempt at the business you may be sure I followed them pretty closely and made the boat as strong as I knew how. As a result I have a good boat, that is not expensive, that sails well and handles as well as the best of them, and is tight and comfortable in every way.

I have used her for two years in one of the Belgrade ponds and expect to use her again the coming summer in the same place.

Mr. Nason says he sails his boat mostly without ballast, but I use 800lbs. of iron in mine and find it about right for our kind of sailing. C. R. CASWELL.

The Mediterranean Races.

ON March 12 the racing was off Cannes, with wind light N.E., course 24 miles. Britannia won the prize, 1,000 francs, offered by A. B. Walker, owner of Ailsa. The latter yacht was beaten by about 5m. On March 15, in a fresh N.E. wind, the two started for the Bennett-Goelet cup. During a long luffing match in the first round Britannia poked her bowsprit into Ailsa's mainsail and both withdrew. On March 17 the two again started from Cannes to Saint Tropez and return, 49 miles, the prize being offered by Pres. Faure. The wind was fresh from the south, and Ailsa won by 10m. The Bennett-Goelet race was resailed on March 19 in a good S.E. breeze. The course was four turns of an 8-mile triangle. As it was necessary that three yachts must start, Mr. Goelet entered the small rater Serina. Ailsa won, beating Britannia by 8m.

A Cruising Schooner.

THE former owner of the fin-keel cutters Paralos and Palmyra, previously illustrated in the FOREST AND STREAM, Mr. Wm. F. Palmer, of Malden, Mass., has now on the stocks at Wood Bros.' yard, East Boston, a new cruiser of somewhat similar type. She will be 47ft. over all, 34ft. l.w.l., 13ft. beam, 5ft. 4in. draft, with long and shoal fin of iron, some six tons in weight. The chief peculiarity of the yacht is her rig. She will carry a mainmast near the middle of the L.W.L., with a single jib on a club. This combination of full lines, fin-keel and schooner rig, should make a very roomy, handy and generally useful cruiser. Palmyra is now on the sale list, to make way for the new yacht, which will soon be afloat.

YACHTING NEWS NOTES.

If there were any doubt of the increasing popularity of yachting in the small classes, not only in this country, but in Great Britain, one need only take into consideration the steady growth in the number of builders making a specialty of small craft. This is perhaps the more marked in Great Britain, where owners are not only calling for a greater number of boats, but are demanding each year a higher degree of knowledge and skill in design and construction. To meet this demand men who have gained distinction as amateur designers are now taking up designing as a permanent profession. A conspicuous illustration of this is the announcement of the formation of the Burnham Yacht Building Co., at Burnham-on-Crouch, England, of which Mr. G. Umfreville Laws, A. I. N. A., is managing director. For several years Mr. Laws has had unusual success as an amateur designer of small racing craft, and where his boats have been in capable hands they have invariably made reputations for speed and seaworthiness. In the design and sailing of racing canoes Mr. Laws is without a rival in Great Britain. Last year, with his canoe Prucas III., he swept everything before him, winning the British Canoe Association challenge cup, and easily placing himself at the head of British canoe sailors. Associated with him in his new vocation is Mr. J. A. Youl, a canoeist and yachtsman who has an enviable record for skill in the handling of small sailing craft. The works in Burnham are in charge of H. C. Smith, of Oxford yawl fame, whose business at Oxford the new company has taken over. The sailing course at Burnham is one of the very best in Great Britain for small raters. Four yacht clubs are located there, including the Royal Corinthian and the London Sailing Club. As many as 150 yachts may be found there at almost any time during the racing season. To appreciate the great popularity of small yachting in Great Britain one need only bear in mind the fact that it is by no means an uncommon thing for a successful small rater to win sixty prizes in one racing season.

The New Haven Y. C. has elected the following officers: Com., Henry S. Parmelee; Vice-Com., T. W. Hammer; Rear Com., George F. Eaton; Sec'y, Frank W. Guion; Treas., Geo. E. Dudley; Meas., Edward P. Avery; Fleet Surgeon, Dr. W. W. Hawkes; Members of the Board of Trustees—George A. Maycock and Joseph D. Sargent; Regatta Committee—C. W. Rawson, F. N. Kinney and C. W. Webb.

It is announced from Halifax that the silver cup presented to the Royal Halifax Yacht Squadron by the Prince of Wales in 1860, for annual competition among members, is to be made a prize for an international yacht race, under the express approval of his Royal Highness. The race is to take place at the entrance to Halifax harbor each year, and is to be open to the Royal Yacht Squadron of Great Britian and all recognized yacht clubs of Canada and the United States. The first contest is to take place during the summer of 1897. The rules governing the annual event are to be similar as far as possible to those governing international yachting contests.

The Buzzard's Bay Yacht Agency has now in hand a fleet of one-design boats for members of the Yale Cor. Y. C. They will be of the Question type, 22ft. over all, 15ft. l.w.l., 6ft. 3in. beam and 6in. draft, with 350sq. ft. of sail. The club will race them off New Haven.

Palmyra, fin-keel, is now offered for sale by W. F. Palmer. This yacht was illustrated in the FOREST AND STREAM of Feb. 1, 1896. She has a very large cabin, with aft headroom, on a draft of 4ft. 8in. She was carefully built under her owner's supervision, and is in all respects an admirable cruiser.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the FOREST AND STREAM.

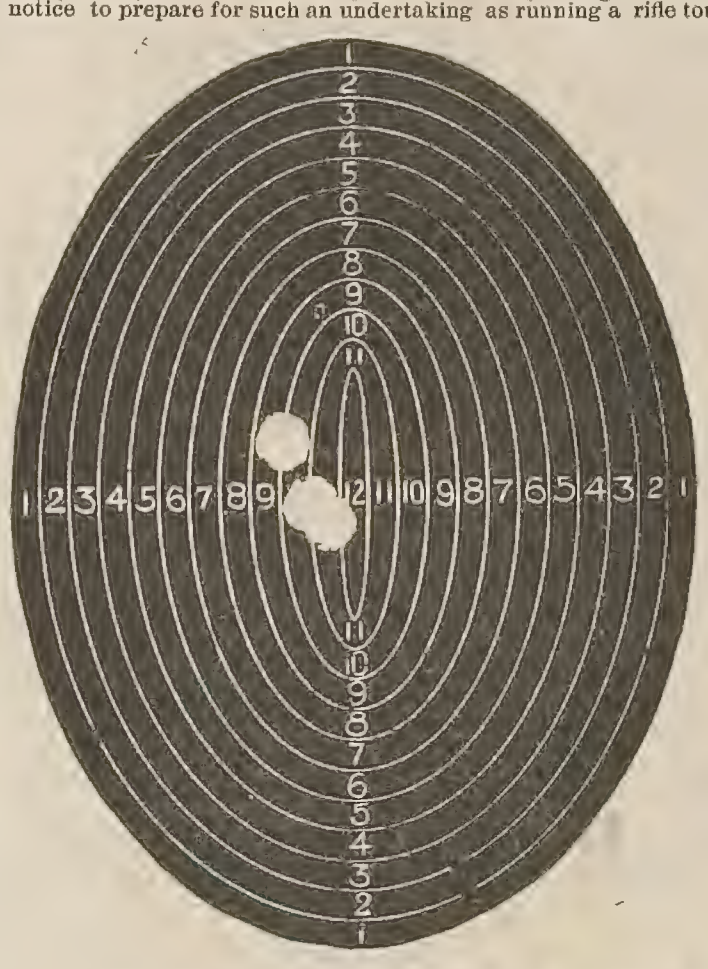
Rifle Range and Gallery.



Tournament at the Sportsmen's Exposition.

DORRLER WINS THREE FIRSTS.

THE tournament for .22 short caliber rifles at Madison Square Garden, New York city, held under the auspices of the Sportsmen's Association, March 13-20, is now a thing of the past, and will go down on the records of the Association as "Mike Dorrler's Tournament." The veteran Jerseyman from Greenville more than upheld his reputation as one of the best men in the country with a .22 short, by placing three firsts out of a possible four to his credit. He won first in the Individual Championship 100-shot match, gaining thereby the title of "Madison Square Champion, '97," together with a cash prize of $20 and a splendid Schuetzen rifle of the highest finish, manufactured and donated for the occasion by the Winchester Repeating Arms Company, of New Haven, Conn. He also won the handsome bronze trophy donated by Gus Zimmerman (himself a rifleman of more than national reputation) to the winner in the contest on the Zimmerman target. Dorrler, however, did not earn this victory easily, as he had to go up against a total of 66 that stood to the credit of Chas. Horney. This total Dorrler could not beat on his 5 tickets, but he managed to tie with his very last target. On the shoot-off Dorrler put up 67, beating his own 66 and winning the trophy, as Horney's "two best" were but 58. Dorrler's third first was in the bullseye competition. It is a coincidence worthy of note that in this contest also he had to go up against a bullseye made by Chas. Horney, a shot that measured only 18 degrees. On Saturday night (his lucky night) he made a shot that measured only 16 degrees, and thus went two points ahead of Horney's shot.

HOW THE TOURNAMENT WAS RUN.

The facilities for running such a tournament in Madison Square Garden are none of the best, space being limited and the ventilation far from what could be desired. The tournament committee had many things to contend with, the main thing being lack of due notice to prepare for such an undertaking as running a rifle tournament on a large scale really is. Under the circumstances the committee had to throw itself upon the indulgence of its guests, and ask them to make the best of what it had to offer them. The chief point lacking was the scarcity of ranges it being impossible to locate more than four ranges in the space apportioned to the committee in the basement of the Garden.

DORRLER'S WINNING TARGETS IN THE SHOOT-OFF OF THE TIE FOR THE ZIMMERMAN TROPHY.

The ranges were in charge of the Zettler Bros., two men who are too well known among riflemen of this continent to need any further comment on our part. Geo. W. Plaisted was behind the cashier's desk and handled tickets and cash during the entire shoot. Save for the necessary interval for supper, Mr. Plaisted was never absent from his post, selling tickets, raking in the cash and shaking hands with old and new friends. Nicolaus Mingst, under the supervision of Messrs Zettler Bros., built the ranges, and his work was all that could be asked.

The tournament committee having charge of the arrangements was constituted as follows: H. D. Muller, chairman; Edward Banks, secretary; Gus Zimmerman, B. Walther, C. G. Zettler, G. W. Plaisted, R. Busse, Ignatz Martin, R. H. Dewey, William Dalton, H. Mahlenbrock, C. Boag, A. Ludwig, D. Meerse and William Hayes. Mr. Muller made an indefatigable chairman, while Gus Zimmerman, R. Busse, William Dalton and Charlie Zettler were always on hand to do their part of the work in running the tournament. Barney Walther, D. Meerse, C. Boag, Ignatz Martin and other members of the committee were also willing at all times to give a helping hand. There was also plenty of assistance forthcoming when the department behind the cashier's desk was in need of it. The thanks of the committee are specially due to Mr. C. Gensch, of Madison, N. J., for his very able assistance as a volunteer for the clerical work of keeping the records of scores made.

A FINANCIAL SUCCESS.

This tournament, known as "The First Annual," was only an experiment. The Sportsmen's Association realized that something in this line was needed, and that contests of this sort are always of benefit to any branch of sport; hence it decided to call together a committee and set it to work. The venture was (to the Association at least) an unknown quantity. The first day's work, Saturday, March 13, was a revelation to the officers of the Sportsmen's Association, and the fact that the week's tournament was a thorough financial success is none the less pleasing to them.

It will not be out of place to state here that the entire receipts of the rifle tournament will, after all expenses have been paid, be held in trust by the Association until March, 1898, when it will be placed at the disposal of a new committee, to be appointed for the purpose of managing "The Second Annual." We make this statement in order that there may be no misapprehension on this point, it not being a part of the Association's policy to rob Peter to pay Paul. Plans for the tournament in 1898 have already been formulated, and for the information of out-of-town riflemen we may also state that the programme will contain several new features, such as contests for .22 long rifles, telescope sights, team matches, and so on. We might also add that the number of ranges will run into double figures. It will be a Schuetzenfest indeed, a fitting forerunner to the great gathering of riflemen at Glendale Park or wherever the National Schuetzenfest will be held during the summer of 1898.

THE REFEREE COMMITTEE.

An important branch of the management of this tournament must not be overlooked. That was the referee committee, made up as follows: Gus Zimmerman, chairman; R. Busse, Wm. Dalton, C. G. Zettler and H. Mahlenbrock. As might be expected, when men of the class which competed in this tournament are shooting for prizes, the duties of this committee were extremely light. The few knotty points that did arise were decided quickly and equitably. A fair field and no favor was the motto which the committee nailed to its masthead, and it lived up to the terms of that motto.

Nothing more remains to be said in regard to this tournament before passing on to a review of each contest separately. It was a success in every respect, but—wait until March, 1898!

INDIVIDUAL CHAMPIONSHIP MATCH.

The contest for the Sportsmen's Association's championship was naturally the most interesting feature of the tournament. An entry list of 46 was large enough to satisfy the expectations of the tournament committee, 50 being the outside limit to be looked for. Among the 46 were pretty nearly all the best shots with the .22 short rifle who live in the vicinity of New York city. Pennsylvania, Massachusetts, Connecticut, the northern part of the State of New York, etc., were also in the hunt. Hartford, Conn., and Syracuse, N. Y., were both represented in the prize list for this contest.

Early in the week L. Buss, of New York city, set the pace by putting up a total of 2,381, and for some time this total was not passed by any competitor. On Wednesday afternoon Michael Dorrler, of the Greenville (N. J.) Rifle Club, and Fred C. Ross, of the Zettler Rifle Club, of New York city, both commenced their strings. Dorrler did not finish that night, but quit after firing five strings of 10 shots, the total for the 50 shots giving him an average of a fraction better than 242. Ross fired his 100 shots on Wednesday, beating L. Buss's total by 2 points only. Up to the end of his eighth string he had an average of almost 240, and it was confidently expected that he would leave a mark of at least 2,400 for Dorrler to go after. The unexpected happened, and Ross fell to 235 and 229 in his ninth and tenth strings, his total reaching 2,383.

On Friday evening Dorrler set to work again and fired his remaining 50 shots. The regularity of his shooting showed true championship form: only once did he drop below 240, and that once was in his ninth string, when he had the match practically won and the first prize and the trophy cinched. The Greenville men were happy, and the members of the other clubs plainly showed how popular Dorrler is with riflemen by applauding his work to the echo. His average for the 100 shots was 242.1. His 10 targets, shown in these columns, tell their own tale.

L. Flach, of the Zettler Club, the fourth man, started in with a 238, but spoiled his average with two consecutive strings of 231 on his second and third targets. In his next two strings he pulled out two 240s, but fell to 234 in his sixth string. Scores of 241, 238, 240 and 239, to close with, brought his total up to 2,372, 9 points behind L. Buss for third place. Flach shot his string of 100 shots early in the tournament. L. P. Hansen, of Jersey City, shot very steadily and averaged 236, his total carrying him into fifth place. W. Rosenbaum, one of the best shots in the Miller Rifle Club, of Hoboken, N. J., and the Hudson Rifle Club, of Marion, N. J., took sixth place with 2,357, his total being a great disappointment to many of his friends, who had looked to Buffalo Bill for a better average. It is only fair to Rosenbaum to state that he was busy all the week assisting in running the revolver contests, which were held on the same dates as the rifle tournament. George Purkess, of the Greenville, N. J., Rifle Club, stepped into seventh place late on Saturday evening, his total being 2,345. At one time it looked as if he would land still higher up the list, but totals of 228 and 227 in his sixth and eighth strings put a damper on such hopes. Greenville, however, was quite satisfied with first and seventh places in the championship contest.

H. M. Pope, of Hartford, Conn., arrived at the Garden late in the week, but lost no time in getting on to the Ring target to find out how he was "holding." He finished in eighth place for the 100-shot match with an average of 233.9. Dr. Stillman, of Syracuse, N. Y., finished in ninth place, 2 points behind Mr. Pope. G. D. Wigmann, of Newark, N. J., made a total of 2,333, taking tenth and last place in the list of prize winners in the Individual Championship contest. Below are the totals of the winners:

R J Young, Montclair N J	227	227	230	231	Retired.
J Bodenstab, New York city	213	220	215	Retired.	

The conditions of the above match were:

Open to all, 100 shots, off-hand, 25 ring target to be shot in strings of 10 shots, only one entry allowed each competitor, any .22 short caliber rifle allowed, entrance $5, including season ticket of admission to the Sportsmen's Exposition. Competitors can shoot their 10 strings during the week as they desire; distance, 100ft exact. Prizes: first, trophy and $20; second, $25; third, $ 0; fourth, $15; fifth, $12; sixth, $10; seventh, $10; eighth, $9; ninth, $3, tenth, $5.

BULLSEYE TARGET.

The bullseye target was a great favorite during the entire seven days of the tournament. The conditions of this contest were:

Open to all, 3 shots per ticket, entrance 50 cents per ticket, re entries unlimited, any .22 short cal. rifle allowed, distance 1,000ft. exact; the best single shot by measurement to count, only one prize obtainable by one shooter. Prizes: First, $20; second, $15; third, $10; fourth, $8; fifth, $7; sixth, $6; seventh, $5; eighth, $5; ninth, $4; tenth, $4; eleventh, $3; twelfth, $3; thirteenth, $3; fourteenth, $2; fifteenth, $2. Premiums: For most bullseyes, $6; for second greatest number of bullseyes, $4; for third greatest number of bullseyes, $3.

Originally the conditions read that shooting on the bullseye target would close on Friday night. After the programme had been issued it was found perfectly practicable to measure all bullseyes shot each day on the following morning, prior to the commencement of the shooting for that day at 1 P M. This left it possible to continue bullseye shooting up to within a short time of closing the ranges for good on Saturday evening, March 20. Each day's record on this target were posted on the bulletin board. For a long time—in fact, up to the very last minute—Charlie Horney's bullseye of 18, made early in the tournament, stood in first place. When it came to measuring up the bullseyes made on Saturday (the last day of the tournament), a shout proclaimed that Michael Dorrler had passed Horney's mark with one of 16. This gave Dorrler and the Greenville boys first place in the bullseye contest

In the fight for the premiums for most bullseyes H. D. Muller, chairman of the tournament committee, was easily first with a total of 186; J. Facklamm, of New York city, came next with 124, and Gus Zimmerman third with 96.

BULLSEYE WINNERS.

A list of fifteen prizes, given below, was offered by the management, and these prizes were awarded as below:

1.	M Dorrler	16	9.	H M Pope	22
2.	Chas Horney	18	10.	Ignatz Martin	23
3.	L Buss	18½ Tie.	11.	Wm Lemke	23½ Tie.
4.	J Facklamm	18½ Tie.	12.	L Flach	23½ Tie.
5.	Gus Zimmerman	19	13.	J Bodenstab	23½ Tie.
6.	J Rebham	19½	14.	Vogel	23½ Tie.
7.	L P Hansen	20½	15.	P di Jorio	26
8.	H D Muller	21			

THE ZIMMERMAN TROPHY.

As announced in the programme, Gus Zimmerman, the chairman of the referee committee, donated a handsome bronze trophy for competition at this tournament. The conditions agreed upon for this contest were as follows: Open to all, 5 tickets of 3 shots each, entrance $2 for 5 tickets, no re entry, 2 best tickets to count, to be shot on Zimmerman special target, distance 100ft. exact, any .22 short caliber rifle allowed.

Under the conditions it was anybody's match. The target was a peculiar one, having the same characteristics in a measure that belong to the man target, a line shot having more value than a side shot An illustration of this will be seen from the winning targets of M. Dorrler, given herewith.

In this contest nothing really dangerous was made until Friday night, when Charles Horney made 66 out of a possible 72. He was congratulated all round and looked upon as an almost certain winner. On Saturday evening, about 7 o'clock, however, M. Dorrler got to work on the Zimmerman target and rolled up 66—34 and 32—as his "two best." This tied Horney's total and a shoot-off for the trophy was necessary. The committee decided that Messrs Dorrler and Horney should shoot off under the same conditions that the original match called for, viz: 5 tickets of 3 shots each, best two to count. On the shoot-off Dorrler won easily with 67 (34 and 33) to Horney's 58. Thus in the shoot-off Dorrler beat his first score.

A casual examination of the Zimmerman target may give some people the idea that it is not a hard target. As a matter of fact only one shooter out of all those who shot in this contest made a highest possible. His name was P. Uhler, of Harlem, New York city, and the next best he could do was a 20! (Note.—The first time the Zimmerman target was tried in the Zettler 75ft. gallery range by Gus Zimmerman himself he made a 36, then a 31, and something lower the next time.)

M. Dorrler thus placed himself at the head of the list once more, and made a record of three out of four for him and the Greenville Rifle Club.

SCORES OF ZIMMERMAN TROPHY MATCH.

M Dorrler	32	34—66
Chas Horney, Jr	31	35—66
H Holges, New York	31	33—64
Ignatz Martin, Brooklyn	30	33—63
J G Dilion, Pennsylvania	31	31—62
Louis Buss, New York	27	34—61
H Kraus, Jersey City	26	34—60
L P Hanson, New Jersey	31	31—62
M Herrington, New Jersey	28	29—57
A C L Hofmeister, Pittsburg	27	28—55
Chas E Gensch, New Jersey	27	28—55

Barney Walther, New York	24	26 50
John Rebhan, New Jersey	24	29—53

Shoot-off:

M Dorrler	33	34—67	Chas Horney, Jr.	25	33—58

CONTINUOUS MATCH.

As usual, the Continuous Match was a favorite competition. An extremely large number of tickets was sold, and the rivalry was very keen up to the close of the ranges at the end of the tournament. The conditions were:

Open to all, entrance for tickets of 3 shots each 50 cents, off-hand, re-entries unlimited, but only one prize obtainable by any one com-

petitor, two best tickets to count, to be shot on 25-ring target, any .22 short caliber rifle allowed, distance 100ft. exact.

Prizes: First, $50; second, $35; third, $25; fourth, $20; fifth, $15; sixth, $12; seventh, $10; eighth, $10; ninth, $9; tenth, $8; eleventh, $; twelfth, $8; thirteenth, $7; fourteenth, $7; fifteenth, $7; sixteenth, $6; seventeenth, $6; eighteenth, $6; nineteenth, $5; twentieth, $5; twenty-first, $5; twenty-second, $4; twenty-third, $4; twenty-fourth, $4; twenty-fifth, $3; twenty-sixth, $3; twenty-seventh, $3; twenty-eighth, $2; twenty-ninth, $2; thirtieth, $2.

Premiums: For best 5 tickets, $5; for second best 5 tickets, $4; for third best 5 tickets, $3.

L Buss, of New York city, achieved the distinction of being the only one of all those who tried their hands in this match to make a highest possible of 75. With a 75 and a 74 he stood head and shoulders over the next two, Gus Zimmerman and L. P. Hansen, who had a 74 and a 73 each to their credit. Ignatz Martin was in fourth place with 146, while Fred Ross, M. Dorrler and D. Johnson were tied for fifth place on 145.

For the premiums the competition was decidedly warm, particularly on the last two days, when the riflemen were hard at work trying to better their scores. In this part of the match Gus Zimmerman was ahead with a total of 263 for the five best tickets, an average of 72^{3}_{5} per ticket. D. Johnson was next to him with a total of 361, an average of 72^{1}_{5}. In third place for premiums were Dorrler and L. Buss (tied) with 359, an average of 71^{4}_{5}.

The winners were: L. Buss 149, Gus Zimmerman and L. P. Hansen 147, Ignatz Martin 146, M. Dorrler, F. C. Ross and D. Johnson 145, A. C. L. Hofmeister 144, W. C. Damron, L. Flach, G. Purkess and H. M. Pope 143, P. di Jorio 142, R. Busse and G. P. Williams 140, W. Dalton, H. D. Miller, Van Allen and E. Minervini 139, C. Gensch, Charles Horney and W. Rosenbaum 138, J. Dillon and J. Boag 137, G. D. Wigmann 136, G. Worn 135, C. Boag, Hy. Holjes, P. Uhler and W. C. Gannon 133.

SCORES OF CONTINUOUS MATCH.

Louis Buss, New York	74	75—149
Gus Zimmerman, New York	73	74—147

3. { M Dorrler*, 73 72 72 71 71—359 / L Buss*, 75 74 70 70 70—359

* Tie.

EDWARD BANKS.

Trap-Shooting.

Leading dealers in sportsmen's supplies have advertised in our columns continuously for almost a quarter century.

If you want your shoot to be announced here send in notice like the following:

FIXTURES.

March 23-25.—NEW YORK.—Interstate Association's fifth annual Grand American Handicap (live birds), at Elkwood Park. $1,000 guaranteed in the main event, all surplus added. Entries close March 20 to John L. Lequin, Secretary-Treasurer Interstate Association, 44-48 Cedar street, New York city.

March 30.—BROOKLYN, N. Y.—All-day shoot of the Brooklyn Gun Club. Targets from a magautrap. Grounds located at terminus of Kings County Elevated in Brooklyn. Theo. Baron, Sec'y, 8 Murray street, New York.

April 7.—PORTLAND, Me.—Annual spring tournament of the Portland Gun Club. Harry A. Chisholm, Sec'y.

April 7.—HACKENSACK, N. J.—Third contest for the Recreation cup, under the auspices of the Bergen County Gun Club. Cup contest at 12 noon sharp. C. O. Gardner, Sec'y.

April 10.—WINDSOR LOCKS, Conn.—All-day tournament of the Windsor Locks Gun Club. Targets. C. F. Cleaveland, Sec'y.

April 14-16.—ATCHISON, Kan.—Airy Lou Hart's third manufacturers' amateur and fourteenth open to-all tournament. $750 added money.

April 14-16.—BALTIMORE, Md.—Tournament of the Interstate Association, under the auspices of the Baltimore Shooting Association.

April 15.—YOUNGSTOWN, O.—First tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

April 15-17.—SAN ANTONIO, Tex.—Tournament of the San Antonio Gun Club. Open to amateurs only. Willard T. Simpson, Chairman Ex. Com.

April 16.—BRIDGEPORT, Conn.—All-day shoot of the Bridgepor Gun Club. Targets. V. A. Blakeslee, Sec'y.

April 17.—NUTLEY, N. J.—All-day shoot of the Yanticaw Gun Club. Targets from a magautrap. Shooting chmmences on arrival of 9:52 train from Chambers street, New York.

April 19.—HINGHAM, Mass.—All-day shoot of the Hingham Gun Club. 100-target handicap. G. O. Henderson, Treasurer.

April 20-23.—LINCOLN, Neb.—Twenty-first annual tournament of the Nebraska State Sportsmen's Association. Added money later.

April 21-23.—SAN ANTONIO, Tex.—Second annual meeting and tournament of the Texas State Sportsmen's Association. O. C. Guessaz, Sec'y.

April 27-29.—BINGHAMTON, N. Y.—Tournament of the Binghamton Gun Club. Two first days, targets; third day, live birds.

April 27-30.—FONDA, Ia.—Tournament under the management of Geo. E. Hughes and C. R. McCord. Live birds. $800 added money.

April 28-29.—RICHMOND, Va.—Tournament of the Interstate Association, under the auspices of the West End Gun Club.

April 28-29.—PERU, Ind.—Tournament under the management of J. L Head.

May 4-6.—DES MOINES, Ia.—Tournament of the Iowa State Sportsmen's Association. Live birds and targets. F. C. Whitney, Sec'y.

May 5-7.—NEWBURGH, N. Y.—Annual spring tournament of the West Newburgh Gun and Rifle Association. First two days, targets; third day, live birds. $50 average money to three high guns in all programme target events. Open to all.

May 11-13.—PEEKSKILL, N. Y.—Annual tournament of the Peekskill Gun Club. First two days, targets; last day, live birds.

May 11-14.—WATERLOO, Ia.—Tournament of the Waterloo Gun Club. E. B. Walker, Sec'y.

May 12-13.—CONNERSVILLE, Ind.—Tournament of the Connersville Gun Club. Live birds. T. F. Thomas, Sec'y.

May 17-22.—KANSAS CITY, Mo.—Annual tournament of the Missouri State Game and Fish Protective Association. Fred T. Durrant, Sec'y.

May 18.—ALBANY, N. Y.—Annual spring tournament of the West End Gun Club. Horace B. Derby, Sec'y.

May 19-20.—SAVANNAH, Ga.—Tournament of the Interstate Association under the auspices of the Forest City Gun Club.

May 19-21.—CANTON, S. D.—South Dakota Sportsmen's Association annual. C. S. Seely, Sec'y.

May 20.—GREENVILLE, Pa.—Second tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

May 26-29.—EAST ST. LOUIS, Ill.—Annual tournament of the King's Smokeless Gun Club.

May 31.—CANAJOHARIE, N. Y.—Eastern New York Trap-Shooters League tournament, under the auspices of the Canajoharie Gun Club. Charles Weeks, Sec'y.

June 2-4.—SPRINGFIELD, O.—Annual tournament of the Ohio Trap-Shooters' League, under the auspices of the Springfield Gun Club.

June 8-9.—PERU, Ind.—Tournament of the Trap-Shooters' League of Indiana.

June 8-11.—AUBURN, N. Y.—New York State Sportsmen's Association tournament. C. W. Tuttle, Sec'y.

June 9-10.—MONROE, La.—Tournament of the Interstate Association, under the auspices of the Monroe Gun Club.

June 10.—NEWCASTLE, Pa.—Third tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

June 15-18.—CLEVELAND, O.—Fourth annual tournament of the Chamberlin Cartridge and Target Company.

June 16-17.—FARGO, N. D.—Third annual tournament of the North Dakota Sportsmen's Association. Targets. W. W. Smith, Sec'y.

June 22-25.—OIL CITY, Pa.—Seventh annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Oil City Gun Club. Targets and live birds. Black powder barred. Special event: 25 live birds per man. $25, $1,000 guaranteed. Send entries to H. C. Reeser, Sec'y, Oil City, Pa.

July 14-15.—NEW HAVEN, Conn.—Tournament of the Interstate Association, under the auspices of the New Haven Gun Club. Wm. H. Hazel, Sec'y.

July 22.—MEADVILLE, Pa.—Fourth tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

Aug. 4-5.—LEWISTON, Me.—Tournament of the Interstate Association, under the auspices of the Androscoggin Gun Club.

Aug. 17-19.—TORONTO, Canada.—Tournament of the R. A. McCready Co., Ltd. Targets. $1,000 guaranteed. Open to all. Write for programmes.

Aug. 19.—WARREN, O.—Fifth tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

Aug. 25-26.—MONTPELIER, Vt.—Tournament of the Interstate Association, under the auspices of the Montpelier Gun Club.

Sept. 15-16.—PORTSMOUTH, N. H.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club.

Oct. 6-8.—NEWBURGH, N. Y.—Annual fall tournament of the West Newburgh Gun and Rifle Association. First two days, targets; third day, live birds. $50 average money to three high guns in all programme target events. Open to all.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

Tom Divine and Frank Poston, both of Memphis, Tenn., are prevented from coming to the Grand American Handicap on account of the heavy floods along the Mississippi. Milt Lindsley also, who manufactures King's Smokeless away off in Ohio, has a pitiful tale to tell in the following letter: "I fully expected to have had the pleasure of meeting you before this, but I find that we are to a great extent the creatures of chance, and many times we are obliged by force of circumstances to change our plans. Our little river here, which furnishes the power for the plant, is usually a very well-behaved little stream; but for some reason or other (I don't know of anything we had done to provoke it) it got on a terrible rampage on the 5th inst., overflowed its banks, and in fact raised 5 or 6ft. higher than it was ever known to do before in its history, or, in other words, in the memories of the oldest inhabitants. The result was that it came very near washing us out of existence, and at any rate we were thoroughly baptized; there isn't any doubt about that. It looked at the start as though it would be months before we could ever get to running again, but as the water went down and we began to clean up, we found things not as bad as they looked, and we are now in hopes of getting started up within a week. Owing to this capricious little river flooding us at this particular time I am denied the pleasure of visiting New York during the sessions of the Sportsmen's Exposition and the Grand American Handicap, and I assure you that I regret it very much. I wish that you would kindly remember me to all of the boys you meet, and explain to them why I am not on my old stamping ground at this particular time. By so doing you will confer a great favor."

On the first day of the tournament at Baychester, N. Y. (the Cobweb's tournament), the purses were divided under the Rose system. On the second day, according to programme, it was put to a vote which system to use. The "old system" was chosen by a majority that showed that the system was unpopular with some people. As a matter of fact the crackerjacks don't like it; they make no bones about saying so, but we have never yet heard any sound arguments used in favor of the "old system" as against the Rose system, and we have never denied the use of our columns to the other side. On our way down to Baychester on the morning of the Cobweb Handicap, we made this proposition to a whole carful of shooters, some of the disgruntled ones being in that same car: "Place yourselves on record, and state on paper your reasons for upholding the 'old system.' Let people read your arguments in cold type. You shall have all the space in FOREST AND STREAM that you want, and we'll file a bond not to use a blue pencil on a single word or phrase." We think this is a fair offer, and one that should be accepted if there is any valid defense to make. Surely we'll hear from them now?

This is what we hear from Lou Erhardt in regard to his tournament, April 14-16: "Will you please add in Fixtures that $750 added will be distributed among the purses at our shoot? Our programmes will be out on March 20, and we shall be glad to forward them to any one who writes for one. We will add $750 cash, no merchandise. There will be eight events, each 20 targets, $2 entrance, $25 added to each purse. Five equal moneys; open to everybody; professionals, manufacturers' agents and any one receiving benefits from manufacturers will shoot at unknown angles, amateurs at known angles. We will run three sets of traps, no magautrap. We will shoot the programme on two sets and keep the other set for open sweeps. The $750 will positively be added, rain or shine. We will shoot on our new grounds in the baseball park on top of a hill, with a background that is perfect; nothing but heaven and clouds to shoot against; $50 per day will be divided as average money among the five high guns. We hope and expect to duplicate last year's entry list, when the entries ran over 100."

The following dispatch to the Chicago *Times-Herald* of March 17 tells us all we want to know of pigeon shooting in connection with prize fighting (note the excuse for "calling off" the championship event!): "CARSON, Nev., March 16.—Owing to the delay in the arrival of the morning trains the championship event was declared off and a series of sweepstake shoots and a match race between J. A. R. Elliott, of Kansas City, and A. J. Bigelow, of Ogden, were substituted. In the sweepstake shoot, in which Champion Elliott declined to enter, A. P. Bigelow, of Ogden, won first money in the first one on 10 straight kills, while 'One-Barrel' Murphy, of Philadelphia, and Joe Barnett, of Albuquerque, N. M., tied for second money. On the second sweep Murphy won on 10 straight kills, Joe Barnett won second money on 9 kills, and G. L. Becker, of Ogden, won third. The 50-bird race between Elliott and Bigelow followed, and the champion won out handily by 47 to 42."

J. S. S. Remsen, of Brooklyn, N. Y., has returned from his Southern trip, having spent some pleasant weeks at Palm Beach, Fla. While at Palm Beach he shot some matches, winning a 50-target race on March 6 with 42 out of 50. His nearest competitor was W. G. Brokaw, who scored 39. Remsen's prize in this event was a handsome set of steins. On March 10 he shot a match with Mr. Brokaw, winning it by 26 to 20, each man shooting at 28 targets. On March 11 he won the Grand Prix of Hotel Royal Poinciana, a very handsome trophy presented by W. G. Brokaw. The race was a handicap affair, Remsen being the scratch man. He won with 41 breaks out of 50; the second on the list was C. Pratt, who broke 40 out of 65, his handicap of extra targets being 15. On the whole Brooklyn was well represented at Palm Beach this winter.

Dick Swiveller was a visitor at the office of FOREST AND STREAM last week. He didn't find us in, as we were making our home temporarily in Madison Square Garden. (It seems so natural to call W. L. Colville, of the Gold Dust powder, "Dick Swiveller," that that name will have to go this time.) When we did fall across him in the Garden he had lots to tell of his ten weeks' trip. He showed us also some samples of the new issue of Gold Dust, which is as hard as any powder we ever handled. He claims it is just what all the boys need, and adds that they'll find that fact out very shortly. Jack Fanning has come from San Francisco for the Grand American Handicap; he will receive a warm welcome at the hands of all the many friends he made while in the East last summer.

Tom Keller was all over the Garden during the Exposition; it was hard to tell where you'd meet him next. The basement, where the rifle tournament was held, was about the last place one would have expected to meet Keller, but he was there. Then we had to find out what brought him down there. That was an easy matter as soon as Fred Ross began shooting, for he used Peters's ammunition. When Ross rolled up 2,383 out of 2,500 Tom was satisfied, and said, "We're in it again!" When Dorrler, who used U. M. C. ammunition, topped Ross's score with 2,421, Tom wasn't feazed, but said: "We're out, but we've three in the first ten."

Elmer Shaner tells us that the programmes for the Richmond (Va.) Interstate tournament will be out next week. He adds that the Richmond shoot will surprise us in regard to the number of entries. We are looking forward to meeting several old friends there, such as Col. Anthony and John W. Todd, of Charlotte, N. C.; H. C. Bridgers, of Tarboro, N. C.; Fonda, and E. Rastus Gilmer; the Lynchburg boys—Terry, Dornin, Scott, Moorman, etc.—and goodness only knows how many more. You can't surprise us on that point.

The three sets of traps at Elkwood Park have got the boys figuring as to what is the best thing to do in the Grand American Handicap in case there's a strong wind and they get 27yds. The wind would probably be a straightaway on one set of traps and an incomer on one of the others. A close-choked gun would be all right on the straightaways, but would be like a rifle on incomers. What's a fellow at 26 or 27yds. to do under those conditions?

The extremely large entry list for the Grand American Handicap of 1897 breaks all records in the line of live-bird events. A glance over the names of those entered in this great event shows a marvelous improvement in the caliber of the shooters over that of any previous year. All the good ones are entered; scarcely a crackerjack is missing, outside of Harvey McMurchy, and, we should add, with all due humility, the only Milt Lindsley.

Mr. J. L Head, of Peru, Ind., writes us that Jack Parker will manage the Indiana Trap-Shooters' League shoot in Peru on April 28-29. Mr. Head adds that Jack Parker, being a manufacturer's agent, will not take part in the sweepstake events, but will see that everybody else gets all the shooting he wants.

The Lake Side Rod and Gun Club, of Burlington, Vt., has elected the following list of officers for 1897: President, E. E. Morgan; Vice President, W. L. Stone; Treasurer, W. S. Phelps; Secretary, J. S. Denning; Captain, L. O. Harding. Board of Directors: J. G. Burns, H. E. Spear, Dr. H. E. Colvin, F. H. Owens and B. H. Eagan.

Billy Crosby, of the Baker Gun Co., of Batavia, N. Y., attended to business all the week at his firm's stand in the Exposition, but took a run down to Elkwood Park on Saturday, March 20, the last day of the show. His score of 25 straight from the 30yds. mark would be a good one for him to duplicate in the Grand American Handicap this week.

The Sportsmen's Exposition of last week was the general meeting place of all the shooters in the vicinity of New York city. They came there for various reasons: To see the guns, etc.; to meet old friends and to make new ones. There was plenty to see in the gun line, because the art of the gunsmith is not retrograding in this country.

The programme for the Interstate Association's tournament at Baltimore, Md., under the auspices of the Baltimore Shooting Association, is a good one and is bound to draw a crowd. The local club adds $450 to the purses, and that's quite a big sum of money now that the days of "$3,000 added" seem to have passed away.

The R. A. McReady Company, of Toronto, Can., informs us, in answer to our letter of the 15th inst., that "the purse of $1,000 is to be divided in various matches, and is guaranteed. It is arranged in such a way that the shooters who can shoot will come out with a good, fat purse." The Toronto tournament will be held Aug. 17-19.

The trials and tribulations of a member of a handicap committee are many. His joys are few, but there is one thing that he does like to hear, and that is a good solid kick from a man who should have had 29yds., but who got 28 and then wasn't satisfied.

There was always a crowd of shooters around the Winchester stand during the Exposition. And why wouldn't there be? With Rolla Heikes, Ferd Van Dyke and Capt. Bartlett as drawing cards, the company was right in it.

Drivers and Twisters may be a little poverty-stricken this week Don't blame the trap department, but lay it up against the Sportsmen's Association and its rifle tournament at Madison Square Garden.

The Iowa State Sportsmen's Association will hold its annual tournament at Des Moines May 4-6. The programme will contain a list of events for both live birds and targets. Mr. F. C. Whitney, of Des Moines, is secretary, and will furnish all necessary information.

The Hingham (Mass.) Gun Club will hold a tournament at its grounds on April 19. The chief feature of the programme will be a 100-target handicap event.

Several New York shooters will visit the Peekskill Gun Club on April 1, leaving the Grand Central depot at 10:30 A. M. The Peekskill boys promise to give a good time and a pleasant afternoon's shoot to all who attend on that date.

EDWARD BANKS.

MARCH 23.

Chartiers Gun Club.

MCKEE'S ROCKS, Pa., March 13.—The anxiety with which the members of the newly organized Chartiers Gun Club looked forward to today, the day appointed for their initial shoot, terminated in a delightful day's sport. A better day could not have been made to order; the light was excellent and the grounds as fine as anyone could wish for. If any excuse is required for the vast quantity of goose eggs shown in the score, it may be said that some of the members had never shot at a bluerock before, and the rest either very little or were out of practice. But the enthusiasm is only intensified and there is a determination to improve, so that the coming trap season may develop some surprises.

The club boasts of the youngest member, to its knowledge, of any trap club, in the person of Master Fred Haas, twelve years old, who shot a little 24-gauge gun and stood up like a veteran at 16yds., and whose attitude and determination augur well for a successful career as a trap shot. This was his first attempt at the trap, but he has all the gameness of his father, who in his day was no slouch.

The attendance was not up to expectation, but promises well for the next shoot.

The score follows, all events being at unknown traps:

Events:	1	2	3	4	Events:	1	2	3	4
Targets:	15	15	15	10	Targets:	15	15	15	10
Thos Dickson	3	6	4	3	W C Clarkson	..	3	7	4
The Secretary	11	12	13	7	J W Onstott	..	10	5	7
Frank Bibb	7	9	4	2	J R Zinkhan	..	4	7	..
Thos Bryan	6	8	6	5	Fred Haas, Jr	..	3	2	..
W H Shaffer	2	6	14	9	J A Williams	..	..	10	..
Frank Babcock	..	7	3	6	Miles Bryan	..	..	0	1
J A Graham	..	7	10	..	S Benner	..	..	5	5

J. H. BABCOCK, Sec'y.

Shoot at Audubon Park.

BUFFALO, N. Y., March 17.—Thirteen shooters were out and did first-class work. E. C. Burkhardt carried off the honors, making several clean scores. He was closely followed by Werlin, Francis and Krotz.

The scores were as follows:

Events:	1	2	3	4	5	6	7	Events:	1	2	3	4	5	6	7
Targets:	10	10	10	15	20	10	10	Targets:	10	10	10	15	20	10	10
E Burkhardt	10	10	10	..	19	7	9	P G Myres	9	8	9	..	..	..	..
C Werlin	8	9	8	11	16	7	8	Francis	..	9	10	12	13	9	6
Coppins	8	8	6	..	11	7	..	Norval	..	6	8	..	..	..	..
Seigrist	8	7	8	12	17	7	8	Daucer	..	6	..	..	..	..	..
Krotz	10	9	7	..	..	..	..	Geisdorfer	..	7	7	12	14	9	7
Snap	7	..	..	..	..	8	..	Wilson	..	..	..	..	..	4	..
W Woodbury	8	9	7	12	..	4	7								

No. 8, 5 live birds, entrance $2, two moneys:

E C Burkhardt	21222—5	Krotz	01211—4
C Werlin	11022—4	Snap	22002—4
Coppins	11122—5	Geisdorfer	20202—3
Seigrist	11222—5		

E. C. BURKHARDT.

Those Western Tournaments.

LITTLE ROCK, Ark., March 18.—ADDED MONEY LATER.—For some time the readers of FOREST AND STREAM have seen this announcement in the Fixtures column in connection with the dates of the Nebraska State tournament. This week Mr. R. M. Welch, the efficient secretary of the association, writes me to change this a little and insert $1,000 added money. This is the same amount added by the association last year, and will doubtless have the effect of drawing a large number of sportsmen to Lincoln. Much local interest is being manifested, and the club has a membership of over 100, which alone should insure a good entry list. Lincoln Park, the place where the tournament will be held, should be an ideal place for holding a shoot, with ample room for three sets of traps, all Empire, which will be used. There will be eight events each day. Another thing that will insure a good attendance is that Airy Lou Hardt's shoot, which is always well attended, will be held the preceding week, thus enabling those who come from a distance to attend both shoots with very little additional cost. Airy isn't saying much, but those who know him are satisfied that when his programme is out the inducements will consist of added money in sums sufficiently large to draw shooters from cities other than those in the immediate vicinity of Atchison. Write Lou for a programme, which always contains much of interest.

PAUL R. LITZKE.

Rochester Two Days' Tournament.

ROCHESTER, N. Y., March 18.—The Rochester Rod and Gun Club will hold a two days' tournament—April 13 and 14—at bluerocks, to be thrown from one of the Cleveland Target Co.'s new magautraps.

JOHN B. MULLAN, Sec'y.

Grand American Handicap.

ALL preliminaries for the Grand American Handicap have been concluded. So far as can be seen nothing has been left undone to make the running off of this shoot as smooth as possible. Messrs. Daly & Chanfrau, managers of the Elkwood Park grounds, and Elmer E. Shaner, manager of the Interstate Association, have apparently covered every point. In the matter of help, Mr. Shaner has the following list of assistants: Referees—Harold Wallack, Long Branch, N. J.; Ed Taylor, of the Laflin & Rand Powder Co., New York city; and Paul North, of the Cleveland Target Co. The official scorers are: J. K Starr, Philadelphia, Pa; J. Vone Emmons, of Long Branch; John O. Regan and Howard W. Gray, of Brooklyn, N. Y. The position of Compiler of Scores is filled by Edward Banks, of FOREST AND STREAM. W. J. McCrickart is squad hustler and general intelligence department. B. H. Norton, of the Hazard Powder Co., and J. Meyerhoff, of Hartley & Graham, will take care of the cashier's department.

In order that all contestants may understand how things are being run, and what to do, the management has issued the following

INSTRUCTIONS TO SHOOTERS.

The right wing of the club house will be reserved exclusively for shooters.

Winners of money in any event must apply to the compiler of scores for orders on the cashier for the money due them. No money will be paid out by the cashier except on receipt of such an order.

Shooters who have rebates coming to them, for birds not shot at, must apply to the compiler of scores for rebate tickets, which will be redeemed for cash at the cashier's office.

In order to facilitate the shooting, and to prevent delay through calling up a contestant who has dropped out in any event with two or three misses to his credit, officials will be placed at the entrances to Nos. 1 and 2 sets of traps, whose duty it is to ask a shooter who has missed a bird in the current round whether it is his second or third miss. All contestants will oblige the management by furnishing the information asked for by these officials.

Shooters must supply themselves with "no bird" tickets, which can be obtained at the cashier's office. These tickets are also good for "byes" or tie birds. Unused "no bird" tickets are redeemable for cash at the cashier's office.

Rule 13 of the Interstate Association rules, relating to the time limit for gathering a bird, and rule 19, which permits a man to gather his own bird, or to send a man for it, *have been abolished.* All birds will be retrieved by dogs, the dog being released *the moment the bird touches the ground.*

The entry list is an extremely heavy one. It breaks all records and leads last year's Grand American Handicap by 30, and also leads the Du Pont Handicap shoot by 14 entries. At Monte Carlo this year the entries for the Grand Prix were 118, so the Grand American Handicap of 1897 may be said with truth, and without any risk of being gainsaid, to oreak all previous records. Below is a list giving the order of shooting, each man's handicap, name and address:

THE ENTRIES.

Order of Shooting.	Handicaps.	Name.	Address.
1	27½	A W du Bray	Dayton, Ky.
2	29	Wm Dunnell	Fox Lake, Wis.
3	32	Charles M Grimm	Clear Lake, Ia.
4	32	J A R Elliott	Kansas City, Mo.
5	29	Bessemer	Pittsburg.
6	27½	W D Stannard	Chicago.
7	27	Irby Bennett	New Haven.
8	29	J G Messner	Pittsburg.
9	29½	J S Fanning	San Francisco.
10	28	H L Landis	Philadelphia.
11	28	E C Meyer	Rochester.
12	27	O D McElroy	Pittsburg.
13	27	Chas Jones	Baltimore.
14	29	Noel E Money	Oakland, N J.
15	29	F W Cooper	Mahanoy City, Pa.
16	29½	Neal Apgar	Plainfield, N J.
17	27	James M Green	Washington.
18	32	Dr W F Carver	Chicago.
19	27	C T Bodie	Cleveland.
20	28½	Gus E Greiff	New York.
21	29	F D Alkire	Woodlyn, Ohio.
22	26	Paul I Clark	New York
23	27	Tom Farmer	Pittsburg.
24	27½	J S Paddelford	Sherburne, N Y.
25	27	Old Hoss	Pittsburg.
26	30	C A May	Pittsburg.
27	30	D A Upson	Cleveland
28	30½	Rolla O Heikes	Dayton.
29	27	Henry See	Newark, N J.
30	28	B Le Roy	Campello, Mass.
31	27	Fred Clayton	New York.
32	30½	C W Budd	Des Moines, Ia.
33	27	M Moccasin	New York.
34	29	C Furgueson, Jr	Brooklyn.
35	28	Clem Marsh	Scranton, Pa.
36	27½	John Glover	Chicago.
37	27½	M Herrington	New York.
38	28	J S S Remsen	Flatbush, N Y.
39	26	E B Puck	Boston.
40	30	Dr J L Williamson	Milwaukee.
41	26	W L Shepard	Chicago.
42	28	J Hamilton	Pittsburg.
43	30	Fred Gilbert	Spirit Lake, Ia.
44	29½	F V Van Dyke	Dayton, N J.
45	30½	F S Parmelee	Omaha.
46	29	Carl von Lengerke	New York.
47	27	Stricker Johnson	Baltimore.
48	28½	Charles Steffens	New York.
49	27	T D Hooper	New York.
50	26	U M C Thomas	Bridgeport.
51	27	H W Johns	Philadelphia.
52	30	147	New York.
53	30½	R A Welch	Philadelphia.
54	30	Chauncey Powers	Decatur, Ill
55	27	Dallas	Cleveland.
56	28	W R Patten	Long Branch, N J.
57	27	Geo L Pieroy	Jersey City.
58	28	Chas Woolley	Long Branch.
59	29	A H King	Pittsburg
60	2½	Jos M Baker	Ridgefield, N J.
61	28	W Fred Quimby	New York.
62	27½	Geo A Mosher	Syracuse.
63	29	A L Irvine	Red Bank, N J.
64	28	Hon Thos Marshall	Keithsburg, Wis.
65	27½	H C White	Little Silver, N J.
66	28	Sandy McPherson	Pittsburg.
67	28½	B A Bartlett	Lakewood, N Y.
68	29	S T James	Newburgh, N Y.
69	27½	Dr G V Hudson	New York.
70	27½	William Wagner	Washington.
71	27	J H Covington	Easton, Md.
72	30½	Sim Glover	Rochester, N Y.
73	27	Thomas Howe	Hingham, Mass.
74	28	Brucker	Omaha.
75	27	J R Wert	Long Branch.
76	28	Richard Phister	Brooklyn.
77	26	Lloyd Taylor	New York.
78	28½	Allen Willey	Hadlyme, Conn.
79	27	Conny Furgueson	Brooklyn.
80	27	J H Shafer	Pittsburg.
81	28	The Scribe	Detroit.
82	28	Jas R Malone	Baltimore.
83	27	R S Waddell	Cincinnati.
84	28	Harry W Thurman	Germantown, Pa.
85	26	W H Sanders	New York.
86	27	A C L Hofmeister	Pittsburg.
87	26	Chicago	Chicago.
88	27	E C Burkhardt	Buffalo.
89	30	R Merrill	Milwaukee.
90	28	W S Eddy	New York.
91	28	F G Moore	New York.
92	28	Chas Zwirlein	Yardville N J.
93	29	Ed Voris	Crawfordsville, Ind.
94	27	B H Williams	Detroit
95	29	Arkansas Traveller	Hot Springs.
96	28	Capt A W Money	Oakland, N J.
97	29	Geo Cubberly	Yardville, N J.
98	27	Theo Leuthauser	Newark, N J.
99	28	M M McMillan	Mahanoy City, Pa.
100	30½	W R Crosby	Batavia, N Y.
101	28½	J von Lengerke	New York
102	27	A C Monies	Scranton, Pa.
103	27	J C Haskell	Lynn, Mass.
104	29	C S Guthrie	Pittsburg, Pa.
105	27	Col J T Anthony	Charlotte, N C.
106	27	W A Hammond	Richmond, Va.
107	27	W H Hyland	Tarrytown, N Y.
108	28	Joe Coyle	Lexington, Ky.
109	28½	Ralph Trimble	Covington, Ky.
110	27½	E D Rike	Dayton, Ohio.
111	29½	J M Browning	Ogden, Utah.
112	29	Phil Daly, Jr	Long Branch, N J.
113	29	E F Thomas	Denver, Colo.
114	27	C W Reed	Passaic, N J.
115	27½	F E Hyer	Colt's Neck, N J.
116	28	J G Knowlton	New York.
117	29	Harry Dunnell	Fox Lake, Wis.
118	26	J R Blamey	Holyoke, Mass.
119	28½	Fargo	Pittsburg.
120	29½	T W Morfey	Paterson, N J.
121	29	Harry S Coldren	Reading, Pa.
122	30	O R Dickey	Boston.
123	28	Charles Matzen	New York.
124	28½	Seth Clover	Erie, Pa.
125	28	Ed Bingham	Chicago.
126	27	B V Jackson	Staunton, Va.
127	27	W M Thompson	New York.
128	27½	E A Geoffrey	Newark, N J.
129	28	F Frank Kleinz	Philadelphia.
130	27½	Tee Kay	New York
131	27½	C F Arno	Syracuse, N Y.
132	28	J A Applegate	South Amboy, N J.
133	28½	A Dukes	Pemberton, N J.
134	27	A Marshall	New York.
135	27½	A S Hunter	Utica, N Y.
136	30	W S King	Pittsburg.
137	27	J S Duston	Newark, N J.
138	30	E D Fulford	Utica, N Y.
139	27	J Arlington	Brooklyn.

ELKWOOD PARK, N. J., March 23.—[*Special to Forest and Stream.*]: The opening day of the Grand American Handicap tournament at Elkwood Park promises to be one of the most perfect spring days imaginable. It is an ideal day for target shooting, but the live-bird shooters are whistling for a good breeze from the northwest It is unnecessary to mention the names of those on the grounds; all one has to do is to glance down the list of entries for the Grand American Handicap, and that tells who is here. Elkwood Inn and its new annex building with twenty bedrooms in it, commenced ten days ago and finished on Saturday, are both filled with guests, two in a room. E. S. Rice and the Western contingent are here in a body, and will stay at the inn until the tournament closes The quality of the talent now on the grounds is of a higher caliber than at any previous gathering. Two more names have been added to the list of entries in the main event, viz., A. W. Sherman, Freehold, N. J., 27yds., and Theodore Hostetter, of Pittsburg, Pa. Others will be added to the list as the post entries come in, and all indications point to 140 shooters going to the score in the Grand American, no forfeits having been declared to date.

Some shooting was done yesterday, but the birds were not very good. In a 10-bird race with 17 entries, four high guns, Knowlton, Tryon, Fulford and Jackson, divided on 10 straight. A miss-and out, $5 entrance, resulted in a long fight, eight men dividing after killing 25 straight. The scores in this event were: Sumpter, May, W. S. King, Grill, Gilbert, Marshall, Tryon, Dallas, 25 each; Hostetter 21; Merrill 20; Fargo, Money, 19; A. H. King, Bowers, 18; Williams 16; Bodie 13; Winston, Fulford, 12; Bingham, Scriebe, Walters, 10; Voris, Budd, 7; Bartlett 6; Burkhardt, Leroy, 3; Crosby 2; Snell 1; Jackson 0. To-day the first event was started very promptly, the large number of shooters on the ground permitting a start as soon as the 8:30 train arrives

The Elkwood Park introductory, the first event on the programme, closed with seventy entries. The conditions were: 7 birds, $5, birds extra, three high guns; a shooter losing two birds has to retire, with the privilege of re entering in case he has a show for the money. So slight was the chance of 6 out of 7 getting any money that several shooters withdrew after losing one bird. Twenty-six men killed 7 straight, tieing for the money. They shot off miss-and-out for three rounds. The names of the straight men were: Powers, Merrill, Carver, Bingham, H. Dunnell, W. Dunnell, Vooris, Gilbert, Hamilton, Messner, Dallas, Heikes, May, McPherson, Green. Fanning, Trimble, Du Bray, S. Glover, H White, James, Dickey, Keller, Strong, 147 and Mersh. In the 1st round of the ties 14 and Mersh missed and retired. Dr. Carver, Heikes and Trimble dropped out in the 2d round. In the 3d round the twenty-one men still in all killed and divided the purse of $350. All three sets of traps were used and everything worked very smoothly.

At 12 o'clock the second event, the Nitro Powder Handicap, 15 birds, $15, high guns, was started with over 100 entries.

EDWARD BANKS.

IN NEW JERSEY.

AT ELKWOOD PARK.

March 13.—There was some good shooting to-day at Elkwood Park. Phil Daly, Jr., won the Hoey cup with 24 after losing his first bird. During the day D. A. Wilson scored 58 out of 63 shot at; T. W. Morfey had the next best record with 57 out of 64, a record close enough to be called a tie with Wilson's

The Hoey cup was at 25 birds, $25; Nos. 3, 5, 6 and 7 were $5 miss-and-outs; No. 4 was 10 birds, $7, two high guns.

No. 1 was a $5 miss-and-out, and resulted as follows: Morfey (29) and Wilson (29) 2, Capt. Money (28) 1, Walters (28), Daly (28), N. E. Money (28) and Loening (27) 0. Other scores were:

AT YARDVILLE.

March 15.—A good programme of live-bird events was disposed of to-day at Zwirlein's grounds, at Yardville, N. J. Nos 1-4 were Jersey sweeps, 4 birds, $3; No. 5 was a shoot off, miss and-out, of the ties on 4 in No 4 event. No. 6 was at 10 birds, $5, birds extra; No. 7 was a miss-and-out. The birds were as usual a good lot of flyers. Scores were:

E. A. WADSWORTH, Sec'y

ON LONG ISLAND.

EMERALD GUN CLUB.

March 16.—The number of members present at Dexter Park this afternoon at the regular monthly shoot of the Emerald Gun Club was just twenty six, a number that shows that this popular New York club is not losing interest in the sport of trap-shooting. E. J. Clark was the only one of the twenty-six to score 10 straight, Dr. Hudson being second to him with 9, his lost bird falling dead out of bounds. Seven killed 8 out of 10. From the above figures it will be seen that the strong northwest wind and good birds were both in evidence at Dexter Park this afternoon:

Class A, 29yds., 7 points:

Ed J Clark	2222222222—10	R C Clayton	2•1202200•— 5

Class A, 29yds., 6½ points:

Dr Hudson	1222221101— 9	Thos Short	1202021102— 7
Geo E Loeble	2111202202— 8	William Sands	2202222002— 7

Emil Weiss	1101102212— 7		

Class B, 25yds., 5 points:

H F Burns	2110010012— 6	Geo K Breit	010010•1?•— 3
T F Codey	0121010012— 6		

NEW YORK GERMAN GUN CLUB.

March 17.—The regular monthly shoot of the New York German Gun Club was held to-day at Dexter Park. The attendance was good and the members present had their work cut out to stop Landlord Lippack's good birds Not a single man of the twenty-two shooters scored a straight 10, four 9s being the best records made. Fred Kronsberg won the club badge on the shoot-off. Scores were:

Seven points handicap:

Dr G V Hudson	2222202211—9	J Wellbrock	1212120211—8

Six and a half points handicap:

J Schlicht	1221221201—9

Six points handicap:

B Koenig	2212221110—9	H Nobel	•12•210221—7
H Leopold	1122012101—8	F Sauter	1021120110—7
P Garms, Jr	2021•21211—8	J P Dannefelser	00•1202222—6
H Thomforde	2202002212—7	A Schmitt	0022000002—3

Five and a half points handicap:

A Lucas	21•0101120—6		

Five points handicap:

M Bonden	1102003011—5	A Le Moult	1202100001—4

Four and a half points handicap:

H Oehl	0212000•10—4	H Mayer	1201002002—4
J Moersch	2111010100—6	J Bissinger	0001002201—4
G Heissenhold	0112010022—6	E Hotz	0022020•0—3

FOUNTAIN ROD AND GUN CLUB.

March 18.—W. Lair won the club shoot to day at Dexter Park, the occasion being the regular monthly shoot of the Fountain Rod and Gun Club. Only four members of the club were present, among them the winner of the Brixey cup, W Lair, who showed his form to day by scoring 9 out of his 10, and winning the club shoot. The scores in this event were as below:

W H Lair	122•222111—9	Dr A Eddy	221•201122 8
W R Allen	2?221•2012—8	J E Lake	0220112011—7

A 10-bird match, Long Island rules, between Lair and Dr. Jones resulted in an easy win for Lair, who scored his last 9 birds. Scores were:

W H Lair	0111111111—9	Dr J L Jones	1101•01011—6

The same pair also shot a 10 bird race under A. S. A. rules, tieing with 7 each. On the shoot-off at 5 birds Jones won with 5 to 3, Lair retiring at the end of the fourth round. Scores in this match were:

W H Lair	2102110201—7	Dr J L Jones	2111022100—7

In another match between these two shooters at 5 birds per man Lair killed his 5 straight, while Jones dropped 1 out of his first 4 and withdrew. A sweeps ake at 5 birds per man resulted as follows: Dr A. Eddy 5, W. Lair 4, Allen 4, Lake 3, Jones 2.

CRESCENT ATHLETIC CLUB, OF BROOKLYN.

March 20.—The attendance to-day at the grounds of the Crescent Athletic Club, of Brooklyn, at Bay Ridge, was decidedly small, the gloomy weather having a good deal to do with it. The following scores were shot, every event being at 25 targets. Scores were:

Events:	1	2	3	4	5	6	7	8	Events:	1	2	3	4	5	6	7	8
A Hegeman	19	17	19	..	14	18	19	12	W Pickett	..	12	..	14	12	..	15	13	17
D G Geddes	18	..	18	14	16	18	14	..	L Hopkins	..	9	8	7	12	..	..	7	12
C A Sykes	..	15	17	..	..	..	..	..									

NEW UTRECHT GUN CLUB.

March 20.—J. A. Bennett won the live-bird shoot to-day at the Woodlawn grounds of the New Utrecht Gun Club. He scored 10 straight. F. A. Thompson scored 9, while J. Gaughen lost two birds, both dead out of bounds. The scores were:

Class A.		Class B.	
J A Bennett (27)	1212122222—10	F A Thompson (29)	1112120122—9
J Gaughen (28)	•222 222 22•—8	Platt Adams (28)	00012•1121—6
W H Thompson (27)	1220022021—7	Dr Littlefield (30)	2001•0w

Trap-Shooters' League for Indiana.

PERU, Ind., March 14.—*Editor Forest and Stream:* Noticing the communication in your issue of March 13 from Mr. H. T. Hearsey, secretary of the State Trap-Shooters' League, in which he states that that organization has been perfected, I wish to say to the gun clubs of the northern part of Indiana, through the columns of your valuable sportsman's journal, FOREST AND STREAM, that when I issued the call for the gun clubs of this portion of the State to meet at the tournament to be given here on April 28-29, 1897, as per my communication published in FOREST AND STREAM of March 6, for the purpose of organizing a northern Indiana trap-shooters' league, I was wholly ignorant of the fact that the State League had been formed. I now wish to announce that I will withdraw from my position assumed at that time *i. e.*, to organize a northern Indiana league—and at this tournament, which is now an assured success in every particular, I will use my every effort to assist in the further perfection of the State organization believing as I do that one strong State league will further benefit the general interests of the trap shooters of the State, as well as arouse a more fraternal feeling among the various gun clubs, than two or more sectional leagues. I would further suggest to the gun clubs of the State that if they wish to not only promote the general interests of the trap-shooting fraternity, but to also strengthen their local organization, they immediately put their club secretaries in communication with Mr. Hearsey with a view of gaining admission to the League.

Immediately upon receipt of the sportsman's journals in this city publishing Mr. Hearsey's letter I secured a meeting of our club, and they by a unanimous vote decided to enter the League, and our secretary was instructed to at once communicate with the State secretary. I also immediately applied for the approval of the State organization of the holding of the tournament at this place on April 28 and 29, which dates were claimed while I was ignorant of the existence of the League, and trust that such approval will be given.

Trap-shooting is on the increase in this State, and I do not think there is a State in the Union better prepared to maintain a State league than Indiana.

J. L. HEAD.

Audubon Gun Club, of Buffalo.

BUFFALO, N. Y., March 13.—The regular weekly shoot of the Audubon Gun Club at Audubon Park, this afternoon, was well attended. Norris won the Class A badge in event No. 3, E. P Reynolds was the winner in Class B, and D. C. Sweet in Class C. After the club events E. C. Burkhardt and L. W. Bennett shot a race at 25 targets per man to decide the ownership of the Brooks & Klipfel trophy. Bennett won with a score of 21 to 20. The scores made in the club events were as follows:

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6

The Cobwebs' Second Annual.

THE second annual tournament of the Cobweb Gun Club, of New York, was held at Baychester, New York city, March 16-19. The programme scheduled for the first two days was a series of target events, the chief one being the Cobweb Handicap, shot on March 19, the last day of the tournament.

The club at present has no grounds of its own, but uses those located at Baychester, which are the property of Messrs. Miller & Zorn. These grounds are easy of access, being only fifteen minutes' run by rail from the end of the Third avenue elevated railroad. The fact, however, that trains on this branch of the N. Y., N. H. & H. R. R. run every hour makes it incumbent on shooters who want to be in time to allow sufficient leeway for catching a certain train or else wait an hour in one of the dreariest spots it has ever been our misfortune to be stranded in. Once at Baychester, it is only a couple of minutes' walk to the club house and grounds, which overlook Pelham Bay.

The shooting grounds slope off rapidly to the water's edge, and for that reason are rather deceiving. They are also exposed to every wind that blows, and on the first day, March 16, it blew hard enough to play havoc with averages. There was a snap, too, to the northwest gale that made the vicinity of a stove a favorite spot when not at the score. The shooting house is really too small for the accommodation of any number of shooters, but on the first day it was not much discomfort to be huddled together around the stove. One end of the shooting house has been boarded off, forming a neat little office, in which Geo. W. Thompson, Jr., the secretary of the club, and Neaf Apgar, who managed the shoot, kept things running in such first rate style that there was never a hitch all day. The purses were figured up in a hurry, and the proper divisions made in short order, and the last round of the last event had hardly been finished when the shooters were requested to step up and draw down the money coming to them.

DIAMOND CUT DIAMOND.

Cold as it was on the first day, there was no necessity of tempering "the wind for the shorn lamb." There was scarcely a lamb in sight; those that did show up and shoot found themselves in company hot enough to keep them warm. The following list of some of those who were present on both days will be sufficient to illustrate what we mean:

Rolla Heikes, champion of the world on targets; Ferd Van Dyke and B. A. Bartlett, all of the Winchester Repeating Arms Co.; C. M. Grimm, of Clear Lake, Ia., holder of the cast-iron championship on live birds; C. W Budd, of Des Moines, Ia.; Simon Glover, of Rochester, N. Y.; E. D. Fulford, of Utica, N. Y., shooting a Francotte gun; O. R. Dickey, of Boston, Mass., winner of last year's Grand American Handicap, and representing Parker Bros.; the Bennett brothers, of Boston, Mass.; R. Leroy Woodward, of Campello, Mass.; Ed Rike, of Dayton, O., a running mate of Rolla Heikes; Neaf Apgar, of Plainfield, N. J., etc.

From the above list it will be seen that the Cobweb Gun Club can flatter itself upon having gotten together a round dozen of target shots that it would puzzle one to pick a team in the United States to beat at this game. The collection of all this talent under one roof was accomplished without the aid of any added money, outside of $50 donated as average money to the six high guns in all programme events on both target days; this, of course, was entirely due to the fact that the Sportsmen's Exposition was in session in Madison Square Garden, the following week being that in which the Grand American Handidap was set for decision. The boys were killing three birds with one stone

Under these circumstances, with such an aggregation of shooters, there was no money in it for any one. Shooting for one another's money, with "2 cents out for targets," made it a case of hard rooting to come out even. A choice few got more than they started with—very little more; some broke about even, but the majority were forced to chalk down a deficit at the end of each day's shooting.

First Day, March 16.

As stated above, the wind blew strong and cold from the northwest. Owing to the wind and the deceptive slope of the ground, with the uneven throwing of the traps chucked in, scores ruled low all the way down the line. "The Daddy o' them all" had to own up to 14 lost out of the first 150 shot at; he then pulled himself together and ran 49 out of the last 50, finishing with the only average of 90 or better made during the day—91.1. He led his nearest opponent by 5 targets when the 10th and last event had been shot. Glover finished in second place; Grimm was third, with Budd and White tied for fourth place.

The outside crowd was not large, only twenty-five shooters in all taking part in the sweeps. Among this number were: M. H. Clark, president of the New Haven, Conn., Gun Club; Gus E. Greiff, Fairmont, and L. Piercy, of Jersey City; Pringle, F. S Edwards, etc.

SCORES OF MARCH 16.

Hebbard shot in No. 8, scoring 11 out of the 15.

Second Day, March 17.

This was a lovely day, not a breath of wind stirring, while a bright, clear sky and a frosty nip in the air made it good to be out of the city. The new additions to-day were not many. Tom Keller, of the Peters Cartridge and King's Smokeless companies, was on hand, running riot as usual; Dr. Mason and Harry Dain came down from Peekskill, N. Y., to take in the shoot, Doc Mason plunking out a 20 straight alone in the seventh event and drawing down enough to make him whole for the day. Eddie Collins, who has been on the sick list for some months owing to a fall from a street car, shot in some events; as did also Landis, a well-known shot from Philadelphia.

The programme stated that the division of the purses on this day would be at the option of the shooters, a vote to be taken before No. 1 was shot. This vote showed a large majority for the "old system," so "old system" it was, and the same old features came up with a monotony that was wearisome. Not that there was any dropping for place; nothing of the sort, so far as we could see; it was clean up and up shooting, with everything in favor of high scores. But it was under the "old system."

Two features of the day deserve special mention: The first was the regularity with which Heikes lost one target in each of the first 8 events; the second was Ed Rike's shooting in the last 6 programme events and the extra event at 20 targets; out of the 125 targets shot at by him in these 7 events he lost just 4, breaking 121 and making a percentage for those targets of 96.8. By this great work he pulled himself out of last place to 8th in the general averages. It was a hot race between Grimm and Glover all day long, while Bartlett and Van Dyke fought it out for 5th and 6th places in the averages. Dickey was unlucky enough to arrive about a minute late for the 9:45 train, thus letting himself in for the double penalty of having to wait an hour for another train and being cut out of the averages. Once on the ground, he made a moderate start, but finished very strongly with 81 out of the last 85 shot at in the programme events. Dr. Mason broke 75 out of the same number (all he shot at), and landed with an average of 91.7. Apgar's totals on both days must be discounted very largely, as he had to work and shoot, something that no man can do and make good scores. Below are the totals:

SCORES OF MARCH 17.

Events:	1	2	3	4	5	6	7	8	9	10			
Targets:	15	15	20	15	20	15	20	15	20	15	Shot at.	Broke.	Av

Zorn shot in No. 2, scoring 10 out of 15.

As stated above, the club donated $50 average money to the six high guns, *not class shooting*, the money being divided into four prizes of $10 each and two of $5 each. It will be seen from the following table of

THE GENERAL AVERAGES

who won the prizes, and how the thirteen men who shot through the programme ended, each man shooting at 340 targets:

	First Day.	Second Day.	Total.	Average.
Heikes	155	159	314	92.2
Glover	150	158	308	90.5
Grimm	149	158	307	90.3
Budd	148	153	301	88.5
Van Dyke	143	153	296	87
Bartlett	140	155	295	86.4
Fulford	141	152	293	86.1
Rike	135	157	292	85.8
White	148	144	292	85.8
W W Bennett	142	146	288	84.7
Edwards	135	149	284	83.5
Apgar	139	142	281	82.6
Leroy	139	140	279	82

Third Day, March 18.

The third day of the shoot was an unpleasant one for live bird shooting. The morning opened foggy and continued so all day, an east wind adding to the unpleasantness. At times too a drizzle that threatened at any moment to turn into rain made matters look ominous for the Cobweb Handicap on the next day. Notwithstanding the bad weather conditions there was quite a good attendance at the grounds, among the newcomers being R. A. Welch and Frank Kleinz, of Philadelphia; Charlie Zwirlein, of Yardville; Dr. Judson, of Utica; W Thompson, of Jackson, Mich.; M. A. Beers, J. L. Brewer and John L. 147 Winston, of the Austin Powder Co.

The birds flew very well, their good quality being the subject of much favorable comment from many of the shooters, who naturally expected poor birds in such weather. The fact that out of sixteen entries in the Harlem Handicap only one man could kill 10 straight speaks for itself.

Event No. 1 was 5 birds, $5, birds included, four high guns; the seven straights of course divided without a shoot-off. No. 2 was 7 birds, $7, birds included, class shooting, two moneys, Rose system, professionals at 30 and amateurs at 28yds. No 3 was the Harlem Handicap, 10 birds, $7, birds extra, handicap 26-32yds., class shooting, three moneys, Rose system. No 4 was a similar event to No. 1, with the exception that winners of first money in No. 3 were penalized 2yds; winners of second money penalized 1yd.; all others at 28yds, except professionals, who were to stand at 30yds unless penalized as above. No. 5 was a miss-and-out. Scores to-day were:

	No. 1.	No. 2.	No. 3	No. 4
C M Grimm	22122—5	2222222—7	(30)..2222220 72 — 9	(30)..2 2 20—4

Brewer	2112221—7	147 (re entry)	20
Grimm	212•		

Fourth Day, March 19.

The weather to-day was even worse than that of yesterday, the start being made in dull, gloomy weather, without the sign of a breeze to give a ray of hope that it would clear up during the day. At noon it was raining gently, but with a persistency that boded ill for the balance of the day. Two hours later it came down solidly and everybody had to get under cover or take the wet as it came.

The entry list of thirty-eight was decidedly encouraging to the club, it requiring only thirty-four to clear the guarantee of $500. Among the new arrivals were: Capt Money and Noel E Money, of the E. C. Powder Co.; Gus E. Greiff, of V. L. & D., the U. S. agents for Schultze powder; Dr. G V. Hudson, of the Emerald Gun Club, of New York; J. G. Knowlton, of New York; U. M. C. Thomas, of the U. M. C. Co., of Bridgeport, Conn; John J. Sumpter, Jr., of Hot Springs, Ark., shooting under his honorary title of Arkansaw Traveler; P. Daly, Jr., of Elkwood Park, and W. R Patten, of Pleasure Bay, N. J.; G. A. Mosher, of the Syracuse Arms Co.; Colin R Wise, of Passaic, N J; Dr Summerson, of Staunton, Va.; Judge Arnow and ex President G. A. Barker, both members of the Cobweb Club; the club was also well represented by C. M. Donnelly, Jack Elliott, P. F. McKeon, Gus Greiff and W. Cashau

Although there were thirty-eight entries in the Cobweb Handicap, only two, D. A. Newton (30) and C. W. Budd (30), killed straight. Newton shot a Greener gun and E. C. powder in Leader shells; Budd shot a Parker gun and Hazard powder in U. M. C. factory-loaded Smokeless shells. The birds were a good strong lot of flyers; with a wind to help them they would have been excellent birds.

A curious incident of the race was the sudden tumble among the straights in the 12th round At the commencement of that round there were seven straight scores of 11. Newton, the fourth man on the list, killed his bird, and Budd, who followed him, also scored his bird. Gus Greiff, the fifteenth man on the list and the only "Cobweb" left straight, lost his bird dead out of bounds. Welch, who followed him (Cashau having withdrawn in the 10th round), also lost his bird in the same manner—dead out. Bartlett, the nineteenth man on the slate, then spoiled his straight by one getting away from him. Dickey, the thirtieth man, had his bird drop dead out of bounds in this round Thus five out of the seven straights dropped down into the 14 hole, leaving Newton and Budd to fight it out Both men killed out, and divided a trifle over $200; seven men scored 14, and divided about $150; fourteen men were in for third money ($100), and five in for fourth money ($50). M. B. McDonnell and Frank Hendrick, both members of the Cobweb Club, acted as referee and scorer respectively.

Shooting did not commence until the arrival of the 9:45 train from 129th street, but a start was made as soon as that train arrived, the first event being the New York Preliminary, 5 birds, $5, birds included, four high guns, 30yds. In this event seven men tied on 5 straight and divided the pot. Scores were:

Preliminary: R. O. Heikes 5, E D. Fulford 5, Ark. Traveler 3, Capt. Money 5, Noel Money 5, C. R. Wise 3, U. Newton 4. Sim Glover 4, Ferd Van Dyke 5, Phil Daly, Jr, 3, H. Walters 4, Dr. J. G. Knowlton 4, Chas. Bartlett 5. O. R. Dickey 5.

The scores in the Cobweb Handicap were as below:

D A Newton (30)	2221222222222 22	15	B Leroy (28)	2022221222 2 220	13

East versus West at the Traps.

IN all branches of sport, baseball, rowing, shooting, etc, friendly rivalry and competition are the very essence of the life of each branch. Once a feeling of antagonism is aroused, more harm than good is the result. There should be no such thing as "hard feelings" among sportsmen, and nothing should be said or done to excite anything of the kind.

In our issue last week we suggested in Drivers and Twisters that a match between 10 or 12-men teams representing the East and the West, chosen from those present at the Grand American Handicap, would be a feature in the world of trap-shooting that would go a great deal toward creating interest in shooting circles. Since then the matter has been discussed, and has found much favor in home circles. Phil Daly, Jr., has offered a trophy worth winning for the team that wins the match; while other suggestions, incorporated below, have also been provisionally agreed upon.

The proposed team race was the subject of animated discussion on Friday, March 19, on the grounds of the Cobweb Gun Club during the shooting of the Cobweb Handicap. It was probably from that discussion that the New York *Sun* gathered the "information" contained in the following paragraph clipped from its issue of March 20:

"The expert trap-shooters from the West who are now here and who are on their way for the purpose of competing in the Grand American Handicap have issued a challenge to the wing shots of the East for a match for teams of ten men. The conditions are that each contestant is to shoot at 50 birds, entrance fee $50 each, and the birds to be paid for by the losing team. Daly & Chanfrau have offered a suitable trophy for the match, which will represent the team championship of the two sections of the country. The make-up of the Western team is as follows:

"Charles Grimm, Clear Lake, Ia.; Dr. Carver, Chicago; Chauncey Powers, Decatur, Ill.; Dick Merrill and Tom Marshall, Milwaukee, Wis.; Charles Budd, Des Moines, Ia.; J. A. R. Elliott, Kansas City, Mo.; W. Crosby, Chicago, Ill.; Fred Gilbert, Spirit Lake, Ia.; and Dr. Williamson, Milwaukee, Wis.

"The date of the match has not been decided as yet, but it is expected that it will be held on the Saturday following the Grand American Handicap."

The above contains one gross misstatement of fact, viz., that the West had challenged the East. No challenge at all had been issued, and for good reason, no Eastern team having been picked or decided upon. The Western shooters have certainly not challenged the Eastern men, neither Charlie Budd, Charlie Grimm or Rolla Heikes being entitled to speak for the West Such being the case, it is regrettable that such a statement should be made at the expense of a body of shooters who have come East to take part in the greatest live-bird event ever shot, the Grand American Handicap of 1897, and who while in the East are looked upon by all shooters of this part of the country as their guests. Something besides courtesy is due one's guests.

The latest suggestions in regard to this proposed team race are as follows: 10-men teams, 50 live birds per man, $50 a side, individual sweepstake, all at 30yds., losing team to pay for the birds; a piece of plate, to be presented by Messrs. Daly & Chanfrau to the winning team, to be disposed of as it may see fit; 10 per cent. to be deducted from the purse to purchase a small cup for each member of the winning team as a souvenir of the event.

The Baltimore Programme.

THE programme for the Interstate Association's tournament at Baltimore, Md., under the auspices of the Baltimore Shooting Association, is ready for mailing and can be obtained of Mr. Geo. L Harrison, secretary of the Baltimore Shooting Association, 129 E. Baltimore street, Baltimore, Md.

The programme calls for two days at targets and one day at live birds. The dates for the tournament have been announced in our list of fixtures so long that it is almost superfluous to add that its dates are April 14-16. The target days are, of course, April 14-15.

The programme for each target day is precisely the same five: 15-target events and five 20-target events each day. The entrance fees are at the uniform rate of 10 cents per target, viz.: $1.50 in the 15-target events, $2 in the 20-target events. The club adds $150 per day to the purses, $12 50 to each purse in the 15-target events and $17 50 in each 20-target event. This makes a sum of $300 added to the purses in the target events.

One set of expert bluerock traps will be used, and a magautrap will supply the place of the other set that will be needed to keep the boys shooting without giving them time to catch cold. All targets will be thrown at unknown angles.

The live-bird programme calls for 3 events: No. 1 is the Carrolton introductory, 7 birds, $7, birds included, $20 added to the purse, all at 30yds., 3 high guns, 50, 30 and 20; No. 2 is the Baltimore sweepstakes, 10 birds, $10, birds included, 32yds. rise all, 4 high guns, 40, 30, 20 and 10; $30 added to the purse. The 3d event is the Maryland handicap, 25 birds, $20, birds included, handicaps from 25 to 32yds., *high guns*, $.00 added to the purse. The division of the moneys will be as follows: 25 entries or under, 5 moneys—30, 25, 20, 15 and 10 per cent.; 26 to 30 entries, 6 moneys—30, 20, 15, 13, 12 and 10 per cent.; 31 to 35 entries, 7 moneys—25, 20, 15, 13, 12, 10 and 5 per cent.; over 35 entries, 8 moneys—25, 20, 15, 12, 10, 8, 5 and 5 per cent. High guns, not class shooting.

Two sets of traps will be used for all live-bird events. Note that high guns win. The division of moneys in the target events will be as follows: In all target events there will be 4 moneys, purses being divided on the Rose system, with ratio points of 5, 3, 2 to 1.

All guns and shells forwarded in care of the A. G. Alford Sporting Goods Co., 129 E. Baltimore street, Baltimore, Md., will be cared for and sent out to the grounds. If any further information is needed, write the secretary, Mr. George L. Harrison, above referred to. We might add that the Carrolton Hotel will, as usual, be headquarters for shooters during the tournament. Reduced rates will be given to shooters

Barre Scores.

BARRE, Vt., March 19.—The Recreation Gun Club held their regular shoot yesterday. The weather was warm and favorable for good shooting and some very good scores were made. Several representatives of the Montpelier Gun Club were present and added to the interest. The highest average was 89 per cent., made by D. W Abbey, H. G. Bennett, of the Recreation Gun Club, and Towne, of Montpelier. The following is the complete score:

C. M. PERRY.

PUBLISHERS' DEPARTMENT.

THERE is a realistic breath of forest and field in the book of the Boone and Crockett Club that commends it to the practiced sportsmen. The men that have contributed to its pages show that their interest in sport is deep-founded, and with their knowledge of hunting craft is combined a happy style that makes subjects which, as a rule, are attractive only to sportsmen equally attractive to the "lay" reader.—*Home Journal.*

FROM SNOW TO SUMMER IN A LITTLE OVER TWENTY-FOUR HOURS is a quick and startling transition, but improved railway travel has accomplished it. Good roadbeds, handsomely-equipped trains, record-breaking time make a trip from New York to Florida a pleasant one. The Atlantic Coast Line *via* Richmond is one of the most popular lines to the South. In connection with the Pennsylvania Railroad it carries passengers in solid vestibuled, steam-heated and electric-lighted trains, known as the "New York and Florida Special," from Jersey City to St. Augustine in exactly twenty-seven hours. It also has fast through car service to Aiken, S. C., and popular Georgia resorts. The bureau of information is at 229 Broadway, New York.—*Adv.*

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, APRIL 3, 1897.

VOL. XLVIII.—No. 14. No. 346 BROADWAY, NEW YORK

For Prospectus and Advertising Rates see Page iii.

FOREST AND STREAM OFFICE

346 Broadway

NEW YORK LIFE BUILDING

Present Entrance on Leonard Street

Take inventory of the good things in this issue of Forest and Stream. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

One affirmed that he had been in a certain Country, where their Bees were as big as our Sheep. This impudent lye one began to examine, and therefore said, Sure then the Bee-hives must be of a huge bignesse. No, saith the other, they are no bigger than ours. How then can they get in? said one. This puzzled the lyar like a Mouse in pitch; at last he answered, Let them whom it concerns look to that. Fragmenta Aulica (1622).

A PERENNIAL CHERRY TREE.

A CORRESPONDENT sent us the other day two stories which had been told by a hunter named Kibbe, and told so often that they had taken a place in the local lore of the neighborhood, to be handed down from father to son as "Kibbe stories." In one of them Kibbe told how once, running out of bullets, he had shot cherry stones at a deer, and the next year had encountered the buck bearing on his frontlet a cherry tree; and the other story was of shooting at birds on a log, splitting the log and catching the row of birds by their toes in the crack. Both of these are fairly meritorious yarns, as such stories go, and the ingenious Kibbe, as the self-styled hero of them, enjoyed a pleasing fame while living, and dead was remembered as a hunter who could draw the long bow with the best of them. It appears never to have occurred to his simple friends and neighbors that Kibbe might not have been the original author of the stories he told, and our correspondent expressed a surprise; which was no doubt genuine, when we advised him that we could not think of printing the Kibbe stories as new, since they were as old as the hills.

The incident is worthy of note, because it furnishes a new illustration of the well-determined proclivity of story-tellers to make themselves the heroes of ancient and travel-stained tales. This invention of the cherry tree sprouting from the head of the deer is at least a century old, for it is given in Münchhausen, first printed in 1785 and as the author of the Münchhausen adventures drew much of his material from ancient stories, this particular fiction may have been contemporaneous with the disputed date of the invention of gunpowder, and the first to tell it may have been a Chinaman. But here in an American village lived a genius who posed as the hero of the episode, and was, by his neighbors, given the credit of its invention; and there was found a writer to send the tale to FOREST AND STREAM as something original, and deserving of a place in print. Thus the buck-borne cherry tree planted so long ago is a perennial, which has been transplanted to bud and bloom and fruit in many lands, and it may be, is destined to flourish long after George Washington and his cherry tree shall have been forgotten. There is a flavor to this ancient humor which is just as acceptable now as it ever was. The same quality which has given the cherry tree life so long will keep it ever green. Generations yet unborn will grin as Kibbes spin anew the old, old yarns in country stores of winter nights.

There is just now going the rounds of our exchanges, and credited to a New York weekly, that old joke of the man who when out with the hounds could not hear the music because the dogs made so much noise. This is another of the long-lived, widely disseminated and always new anecdotes of the field. It may well be more ancient than the cherry tree story, for huntsmen followed the chase and were enchanted with the music of the hounds for ages before there existed such a thing as a gun for deer shooting. In the works of John Taylor, the Water Poet, published in London in 1630, appears a version, which runs:

> A Mayor that was a hunting (by chance) one asked how hee liked the *Cry;* a curse take the *Dogs*, saith he, they make such a bawling that I cannot hear the *Cry*.

Since Taylor, like the later Münchhausen, gathered some of his good things from very old fields, this skit of the music of the hounds may have tickled the fancy of huntsmen of that distant age sung by the poet:

> "When Music, heavenly maid, was young,
> While yet in early Greece she sung."

GREATER NEW YORK.

THE German way of saying What is the matter?—*Was ist denn los?*—has been taken over into English slang as "What's loose?" It is a fitting comment upon the annual flood of bills which pour in upon the game and fish committees at Albany. A list of the measures of 1897 is printed in another column; we do not pretend that it is complete, but the showing of more than sixty separate bills in the Assembly and one-third as many more in the Senate is quite enough to provoke the inquiry, What's loose?

The measures include good, bad and indifferent. For some of them, notably the duplicate bills to repeal Sec. 249, there was urgent need. Others, like Mr. Post's, to permit the use of floating devices for wildfowl in all Long Island waters, should not have come out of committee. As a matter of fact, this vicious measure was rushed through both houses and was the first bill to receive the Governor's signature. It was prompted by a market hunter, who secured its enactment that he might more readily kill ducks for the New York market. This Post law and Sec. 249 (making an open market the year around) are specimens of the game legislation we may expect for the Greater New York when the city shall be a State by itself and independent of the rest of the State. Under existing conditions an unsolved problem of protection is how to stop the steady progress of game from the country districts into the city markets. Under the new order of things the market will be thrown wide open; and the new State, constituted of what is now New York outside of the Greater New York limits, will be compelled to provide and enforce a very stringent non-transportation system.

INTRODUCTION OF EXOTIC SPECIES.

A CONSIGNMENT of jack rabbits was recently brought from Kansas for a game preserve in New Jersey; another lot has been contracted for to go to Long Island; and we learn that Maryland sportsmen are contemplating the stocking of certain districts in that State. The enterprise has been attempted before, but we believe without any pronounced success. The rabbits, it is said, increase in size in the East fifty per cent., but as to numbers the stocking experiments have not proved successful. This is due, no doubt, to the unsuitable conditions which so far have been encountered. The jack rabbit is a creature of the prairies; its subsistence is found in the grasses and other vegetation of the plains. The failure of the species to thrive in the East is accounted for by the reason that favorable food conditions have been wanting in the districts where it has been put out. Nevertheless, the fact that on his native heath the jack is classed with vermin and is accounted a tremendous pest should induce us carefully to consider possible results before establishing him in a new country. In the States of the West the jack has wrought hundreds of thousands of dollars worth of damage to crops, and vast sums have been expended from public treasuries in bounties for his destruction. Orchards, gardens, farm crops have been devoured by the jack rabbit hordes; the problem of coping with the pest is yet unsolved, and there is little promise that any adequate remedy will soon be provided.

The individuals and clubs who are engaged in these well-intentioned jack rabbit stocking enterprises are actually introducing into new fields a wild creature which is known to be a species of vermin, and vermin which under favorable conditions is destructive beyond calculation. The folly of this jack rabbit introduction will be commensurate with the scale of success which shall attend the project. So long as the jacks shall be confined to game preserves and the private estates of those who are bringing them East, there will be no occasion for public concern; but whenever it shall happen that conditions shall favor rapid increase—the jacks taking to their new food supply and having immunity from their natural enemies, the coyotes—we shall have the spectacle of communities casting about for means to rid themselves of the jack rabbit plague.

This whole matter of wild animal importation and liberation should be put under some competent and adequate supervision; it should no longer be left to individual whim and irresponsible impulse. There are salutary statutes in several States to prohibit the planting of new species of fishes in waters already stocked with food fishes without the consent of fish commissioners. There should be similar laws forbidding the introduction of any bird or mammal without the approval of some authority fitted to determine the merits of the enterprise in view of the probable or possible effects upon agricultural interests or the native supply of game. Such an authority now exists in the Biological Survey, formerly known as the Bureau of Ornithology and Mammalogy, a division of the Agricultural Department at Washington. The members of the Survey are engaged in exhaustive studies of animal life. They have fully investigated, among other species, the jack rabbits, and their studies should have equipped them to form an intelligent opinion and to pass judgment with authority concerning the advisability of introducing these animals into new countries. States might profitably add to their game statutes a provision forbidding the introduction of exotic species without the Survey's indorsement of the enterprise as harmless. Congress would no doubt make due provision to add to the duties of the Survey the new one of sitting in judgment upon the projects of jack rabbit and other vermin importers.

YANKEE AND HOOSIER.

ONE effect of such affrays as that recent one which occurred on the Tolleston Club grounds in Indiana, where trespassers were killed by the club police, is to intensify the prejudice with which game preserves and game protection are regarded in many sections. As a result of the Tolleston incident a bill was recently presented in the Indiana Legislature forbidding the setting apart of land for game preserve purposes.

This is interesting and instructive as an expression of antipathy to the shooting preserve system; but there is no reason to believe that it represents Indiana sentiment at large. On the contrary, the general tendency of landowners in Indiana, as in California, Ohio, New Jersey, Connecticut and elsewhere, is to make more clearly defined and more stringently enforced their exclusive rights to control their lands as they please and to keep off intruders.

The trend is in the direction of more rigorous trespass laws. Instead of the doctrine that an owner may not protect his own shooting territory, the principle of his unquestioned right to do so is having wider adoption. In contrast with the Indiana anti-preserve movement is the action of the Connecticut Legislature last week when there came before it a bill to open to the public those streams which might be stocked with fish at public expense. The members repudiated the proposition. Connecticut farmers are willing and eager to have their trout brooks stocked by the State, but they propose to retain control of the streams because they can lease the fishing privileges. They hold out stoutly for the very principle which is opposed by the Indiana anti-preserve agitators; and it must be conceded that in this the Yankees of the Nutmeg State show themselves shrewder than the Hoosiers.

SNAP SHOTS.

At first blush the connection might appear remote between the bubonic plague of India and the game supply of McDonough county, Illinois, but the relation is not fanciful; for Dr. O. W. Blaisdell, who has undertaken to stock Illinois with Indian game birds, has been hindered by the plague from bringing over a lot of chuckor partridges he had contracted for. Some of the chuckors previously put out, Dr. Blaisdell tells us, are known to have survived, and it is possible that from this feeble stock the race may be established.

Norway and Sweden are intent upon making known to the world their attractions for the sportsman tourist; and at the Scandinavian and Russian exposition, to be held in Stockholm this summer, the sportsmen's exhibit will be comprehensive and prepared on a large scale. Salmon fishing, elk hunting, and other phases of sport will be illustrated.

The Sportsman Tourist.

TALES TOLD BY THE CAMP-FIRE.—II.

BY AMATEUR.

AFTER our guide had ended his yarn we finished arranging the cabin so that we would be comfortable during his absence; but his story had cast a feeling of discomfort over the whole of us, and our feelings were not soothed by the grewsome reflection that we were camping in the very cabin that had been occupied by the two hunters, and to which the body of the one killed by the panther had been brought. At last the old fellow took his leave of us, and we were left to our own devices.

"Why do you suppose that old villain told us that tale?" asked one of our number, addressing no one in particular.

"I don't believe the yarn, not a bit of it," said another. "I was up North a few winters ago with a friend, and we had an old fellow for a guide who took the greatest pleasure in life in telling us all manner of horrible stories about men having been killed or injured in different ways. He seemed to have a longing to see us shiver. But one day my companion remained at the camp, about which our guide had told us some blood-curdling story, while the guide and I went out into the woods, and in two or three hours came back with a brace of fine wild turkeys. As we got within about a quarter of a mile of camp we heard a tremendous racket, somebody whooping and yelling at the top of his voice, though we couldn't distinguish any words. I gave an answering whoop, and then everything quieted down.

"'What do you think 's the matter, Charlie?' said I to the guide.

"'I dunno,' said he; 'sounds as if Jo'd got drunk.'

"I rejected this proposition at once, but the guide shook his head, and we quickened our pace for camp. As we drew near we saw that there was a good fire, but Jo, my companion, was nowhere to be seen. But suddenly we heard a voice, Jo's voice, saying: 'Here, you fellows! drop your guns and throw up your hands.'

"Charlie's gun slid to the ground and so did mine, and both our hands went up into the air, when Jo again said: 'Now, Charlie, I've got the head of my Winchester square on your heart, and if you don't swear by all you hold sacred that all those tales you've been telling George there and me are lies made out of whole cloth—nothing in 'em at all—I'm going to shoot you dead right where you stand. No back talk now. Are you going to swear or not?'

"I need scarcely say that Charlie took his oath to the utter falsity of all the local history he had imparted to us during the trip, and further, that he would confine himself strictly to the truth on the remainder of the journey.

"'Now, you let those guns lie just where they are, unless George says they're not loaded, and come on into camp,' said Jo.

"I gave him the assurance he required, when we took up our guns and marched up to the fire.

Charlie was the maddest man I ever saw, but along toward 10 o'clock he cooled down and laughed over the adventure.

"We had a glorious time, got home all right, and have been together with Charlie since, but I couldn't help thinking that if some one of us should try Jo's trick on that old fellow that did all he could to make us all feel miserable, we would have obtained a similar result to what Jo got from old Charlie."

The next day we had fairly good luck in the woods, but at night by the fire in the cabin several of the party complained of missing what they thought fair and easy shots. One of our number spoke and said: That reminds me of a little tale that I've heard my grandfather tell when I was a child, and to pass the time away I'll tell it to you for what it's worth.

My grandfather was born in what is now Greene county, Pa., in 1780, and was a woodsman and hunter from the time he could look through the sights of a rifle. Ezra Engle was married to an older sister of my grandfather, and Ezra Engle was the gunmaker and gun repairer for a large scope of country between the Laurel Ridge and Pittsburg. His guns had 3ft. barrels, flint locks, were always full stock, and sometimes, but not often, silver-mounted. His initials, E. E. in script letters, are always on them just back of the hind sight, which is always elevating. The front sight is always copper, and stands well up from the barrel, into which it is fixed without a base. A few years ago at a sale I bought one of his guns, beautifully mounted, with the original flintlock, all in good condition, and I wouldn't take any money for it to-day. This is the story as told me by grandfather:

One time, said grandfather, I suppose it was along in 1805 to 1810, I took my gun, a rifle that your uncle Ezra Engle had made for me; it run sixty to the pound, was flintlock (there were no cap locks in those days) and had a single trigger. Ezra didn't put double triggers on his guns, but he had a way of fixing them with a screw so they'd go as easy as any double-triggered gun and never creep, or as hard as an old musket. [The gun I have has this peculiarity, but I don't understand it.] I went out to kill a deer or two, or something like game. I had several nice, easy shots, and missed them all. At last I became discouraged and mad, and went home feeling badly over my bad luck.

When I went in your grandmother said, "Why, Een, where's your deer?" [Grandfather's name was Aaron, but my grandmother always called him 'Een.']

"In the woods," said I, very much out of humor. "I never had such hard luck; missed every shot I had."

Your grandmother seemed surprised, but said nothing; but at this an old Indian, very old, who had the liberty of every house about there, got up and said: "Een good shot; no can miss if gun all right. Let ole Nosey see him gun if no load in him."

I don't know the old Indian's name; everybody called him Nosey, and I had his name Nosey put on his tombstone, for he died at my house, and I had him buried. [My grandfather would always put in at this point.] I handed my gun to old Nosey, who threw back the frizel which covered the pan, and looked at the touch-hole and pan, and then blew into the muzzle of it, and looked again at the pan, when he said:

"Gun much heap sick, no can shoot. Gun need um physic. You give gun physic, him git well, then gun shoot heap much good."

Your grandmother and I both laughed, but I asked, "What makes you think the gun needs a physic, Nosey?"

"Look at um touch-hole, look at um pan," said he, "you see water come out of him like lead. When gun do so him sick, and no can shoot till him git physic."

"But I don't know how to physic a gun, Nosey. Do you mean I am to clean it?"

"No, clean um do no good, gun sick," said Nosey. "White man no kin physic gun, no kin find out how, but ole Nosey tell white squaw. Een squaw, she mus'n't tell Een, but kin tell nudder brave, her son if her wants to, and he kin tell little squaw, him sister, an' she tell Een. Squaw no kin tell squaw, brave no kin tell brave. Squaw tell brave, but not her brave. Brave kin tell squaw, but not him own squaw. If Een willin', Nosey tell squaw, squaw git stuff; Nosey make big medicine and give gun physic, but Een must kick um squaw before she start and Een must say nothing, nothing 't all."

Your grandmother and I were much amused at this, but finally agreed to try the treatment. Nosey took your grandmother out of my hearing and told her what he wanted. I administered the kick. Before I did so, however, Nosey said: "Squaw no mus' laugh when Een kick. Squaw mus' look much heap sorry, an' came back and do what Nosey tell him."

Your grandmother went out, and after a time came back and put a lot of roots and leaves and twigs into a kettle filled with running water. While she was gone I had unbreeched my rifle and taken out the breech-pin, and Nosey had plugged the muzzle tight with a wad of tow. He waited until the stuff in the kettle had boiled, when he filled the gun-barrel with the boiling water and stuck the breech end of the barrel into the kettle, into which he threw the breech-pin, and left the barrel in the kettle until the plug flew out of the muzzle and a lot of dirty foam ran out of the gun-barrel. When this stopped running he took out the barrel and wiped it thoroughly, and then wiped the breech-pin. He then took a lump of deer's tallow and greased the barrel all over the outside, and greased the breech-pin with the marrow from a deer's leg bone. He held the barrel up for me to look through and it was as bright as silver inside. He put in the breech-pin and put on the stock, first cleaning the lock thoroughly. After he had finished he handed me the gun, saying: "Now, Een, gun well. Now can shoot."

I went hunting next day and killed five deer and two turkeys without missing a shot.

Your grandmother told your Uncle Jake, he told your mother and your mother told me; but I can't tell you, your mother or your grandmother must tell you what old Nosey's receipt is. It won't do for a man to tell a man. Your grandmother told Ezra Engle and he used the receipt a long time, but I had to tell his wife—my sister Charity—so they could use it. Along after 1815 your Uncle Ezra Engle concluded to go to St. Louis with his family, and told his brother Barnes, who was a gunsmith, and Barnes told his wife and afterward tried to use the receipt; but he never could make the plug fly out of the muzzle, and rusted all the guns he ever tried it on. But I can take the worst old musket, if the lead color shows about the touch-hole, and your grandmother or your mother will get the stuff after I've kicked her, without speaking, and make it like a looking-glass inside.

[FOURTH TALE TO BE TOLD NEXT WEEK.]

QUAIL SHOOTING IN EGYPT.

THE temple of Komombos is one of the most imposing in Egypt. This is not due to its great size, but is owing rather to its commanding position. It stands on a broad curve of the river, where the Nile makes a sharp turn, and the broad, steep wall descending from the wide *parterre* in front of the ruins to the water brings the massive columns into majestic relief against the intense blue of the sky. We were lazily floating down the river yesterday, about four miles above Komombos. The surface of the water was glassy, excepting where an eddy sent the water swirling into silent circles, or one of the large Nile fish leapt in air in pursuit of its shiny little smelt-like prey. We were floating now sidewise, now stern foremost, and the sleepy monotone of our boatmen chanting as they used their unwieldy oars, or the sing-song cries of the *shadoof fellaheen* (peasants engaged in supplying water to the irrigating ditches) as they raised and lowered their goat skin buckets, were the only sounds. Moving with the current we were, and making about three miles per hour. It was very warm, but Selim, our dragoman, suggested that we go ashore in the felucca and walk down to the temple, through the lentil fields, and shoot some quail. * * * The Messina quail is a curious little bird. Hatched in Europe in June, he grows up on the fat of the land, and in October, when the nights become chilly, he travels southward, getting strong of wing and plump of body from the grain fields of France, Italy and Greece. He then crosses the Levant, making as many stops as there are islands in the extreme eastern Mediterranean. He makes short stays at Crete, Cyprus and Asia Minor, and, tired out, he at last comes to the Delta of the mighty Nile and travels up its fertile valley. On and on he flies, past the first cataract into Nubia, past the second cataract into the Soudan, past the now unknown country of the Mahdi and the Khalifa, on and on to Abyssinia. There he spends the early winter months and returns by the same route in February to spend his summer in Europe absorbed with his family cares. On the way down the valley in February he grows very fat upon the ripening grain. His favorite food, however, is the lentil or small bean.

When at last he drops exhausted on the shores of Greece or Italy he is so "done up" that he can be snared or often picked up by the thousand, and is served as *petit caille* in every hotel and restaurant in Europe.

On landing we found no trouble in securing the services of a local *shikiri* or *guide de la chasse*. His name was Achmed Nass, and he soon had six youthful beaters of ebon hue engaged at ½ piastre each (2½ cents), and we started down the fields. I took my position in the center of a line covering perhaps 50 or 60yds. Selim, having a gun, guarded the right wing. Achmed walked at my right. The signal to start is given and our little army moves forward. And now the air is filled with the shrill cries of the beaters. Each boy pitches his cry in a different key, and the resulting sounds from end to end of our line are quite comparable to the chorus made by a number of tree toads at home, rolling out their shrill calls before or after a thunderstorm in summer. Soon the little birds begin to buzz up. They rise singly or in pairs and occasionally three at a time. They have a rather swift, low flight, and rarely fly far, dropping into the wheat or lentils with a sudden tumble, resembling quite forcibly our sora or rail (*Porzana carolina*). In fact, this shooting strongly reminds one of rail shooting, if imagination but substitutes boats for men. These fields are completely submerged at "high Nile" or during the inundation. As the water recedes the mud dries and cracks, and as little or no cultivation is necessary before planting, the ground is left very rough and the walking is disagreeable.

The guns are cracking now right, now left. At every few steps one, two or three birds flip up, and we pass over many which rise behind us, but are allowed to escape on account of the danger, as quite an army of men and boys follow us as rear-guard and in the hope of getting a little *backsheesh* (money).

We pass many groups of the *fellaheen*, with their donkeys, camels and sheep. Their summer homes consist of a small inclosure made of corn stalks woven into walls, and set on end. The women and children spend their days squatted on the shady side of this wall, and at night all sleep inside. There is no roof, as there is never rain in Egypt. When the inundation begins again in June or July they betake themselves with their belongings to the mud villages, which are sufficiently elevated to escape the water. In times of exceptional flood the mud houses melt away like snow before the sun, and the inhabitants live in boats and upon improvised rafts tied to the trunks of the palm trees. At such times one sees camels, donkeys, sheep, goats, chickens and dogs and people all crowded together.

The sharp report of the guns goes on incessantly. A puff, a cloud of dusty feathers, and little Mamoud rushes forward to retrieve. A reload and on we sweep. If the quail are as plenty as this all the way down the valley what countless millions there must be!

The chief engineer of the railway now building tells me that he hunts these little birds with his fox terriers as retrievers. They are also hunted with pointers, and afford excellent sport.

Hassan, our boy from the dahabeah, is kept busy supplying me with cartridges, and as his load grows lighter his *gilabia* bulges as the dead birds are passed from one or another of the beaters to his care. As we approach the great ruin of Komombos it is impossible not to think for a moment of the strangeness, the incongruity of the scene. Here stands an American, shooting quail with a hammerless breechloader in the shadow of one of the grandest works of the hands of man. If on the eve of the twentieth century of the Christian era old Tothmes II. (1700 B. C.) could lift his mummified head from his sarcophagus and look about! What would he say? He would rub his eyes for a moment and then, with Mr. Townsend's Chimmie Fadden, exclaim, "What t'ell!"

The little quail, however, has never changed. In all the temples, in all the tombs, one sees the little fellow depicted in all his colors with life-like fidelity.

Our dahabeah, the Ammon-Ra, is found at the bank above the ruin. How good to get out of the broiling sun. We use up our last morsel of ice, brought on at Assouan, and we sit and count our forty-five plump little birds.

INCOG.

ALONG THE POTOMAC.

(Continued from page 204.)

I CLOSED the first stage of my tour with a description of a favorite feeding resort for water fowl on Hunting Creek, and with a promise in the closing paragraph of a description of the adjacent tract of marsh and jungle, with its inhabitants.

This immense tract of marsh was in earlier years subject to overflow at each recurrent tide of the Potomac River. Consequently it was useless for cultivation, and also detrimental to the health of the surrounding country. The proprietor therefore attempted to reclaim it by throwing up an embankment along the margin of the river and creek. This was only partially successful, and left it in a condition called a pocoson, by which name it was known in the vicinity. Its partial drainage apparently produced the effect of changing its condition sufficiently to attract numerous families of the feathered race, in addition to those previously domiciled within its borders. The altered condition also enabled some of the small class of quadrupeds, particularly that nocturnal marauder, the crafty coon, to make it their abode and unassailable fortress during the day, and from which they would make their sorties to plunder the surrounding cornfields. In short, at the time that I participated in its pleasures (about sixty years ago) it contained all the elements essential to constitute what a modern sportsman would consider the *ne plus ultra* of his desires.

There were numerous small ponds, an occasional islet or elevated spot sufficient to sustain a cluster of bushes, occasionally a gum tree lifts its head above the surrounding foliage; and intersecting the tract in different directions small streams sufficient for the passage of a skiff present themselves conveniently for those who wish to pursue their mazy course in pursuit of game. And do not think I can be justly charged with exaggeration by saying there was not at that time another tract or division of land of similar dimensions containing greater numbers of the various species of the feathered race in the classification of animated nature. Among the divers species which annually migrated hither to participate in nature's beautiful harvest we believe the wood duck, known as summer duck, is entitled to head the list, as its sojourn is longer. They come early in spring, propagate and raise their broods, and remain until compelled by stress of weather to depart. They build, or, rather, deposit their eggs in the cavities of decayed trees (which were numerous around the margin of the pocoson), 30 or 40ft. above the ground, from which elevation I have witnessed them transport their young to the water, which operation appeared to be by the mother grasping the neck of the young one with her bill. When placed on the water the young brood appeared to be as familiar with the use of their propellers as are young partridges with theirs on *terra firma*. The different varieties of the mallard family came annually in abundance; and as food was plentiful, and the natural surroundings specially adapted to their instincts, their plumage and action could be seen in perfection. Although the

mallard is conceded to be the progenitor of our domestic duck, yet its natural characteristics appear to be more widely separated from the habits of their domestic descendants than any of the duck species. While the domestic progeny of the mallard are more gentle and fearless of injury than any other of our fowls descended from a wild race, they, on the contrary, are continually apprehensive of danger, exceedingly wary, and as alert as Scottish clansmen in expectation of an attack; and at the slightest alarm will rise from the water, or apparently bounce nearly perpendicular until reaching an elevation above the surrounding trees.

This pocoson was also a famous resort for those consummate pirates of the duck species, the widgeons, commonly called bald-pates, which obtain a portion of their food by open brigandage. They are fond of the marine plant, which constitutes the principal food of the canvasback and redhead, which these wildfowl obtain by diving to the bottom to secure the roots. As diving is not among the widgeon's accomplishments, they are compelled to resort to drastic measures to gratify their epicurean desires. Therefore they repair to the adjacent feeding grounds of the superior fowl, and mingle with them (apparently socially) during their feeding hours; and when one of the divers rises from the bottom with the fruit of its enterprise grasped in its bill, one of the nearest social visitors seizes the coveted morsel without ceremony before the victim could shake the water from its eyes. That quality or mode of acquirement appears to be inherent in this species of feathered brigand. As this quality is implanted by nature, I suppose it is all right, and although not in accord with our system of justice, yet we find some human bald-pates in perfect sympathy and practice with their congeners, and many of them seem to occupy reserved seats in the front row.

The beautiful little green-winged teal was an annual visitor, arriving in October to participate in the bountiful feast which nature provided for the feathered species, particularly those of the aquatic classes. Here they reveled amid the ripe seed falling from the wild oats and various other plants indigenous to the locality. This beautiful little duck, although quite numerous here on each returning autumn, never congregated in large flocks, either in flight or at rest. They were clannish rather than social in their habits; I seldom saw over fifteen or twenty assemble together. I have frequently watched from a secluded spot their little assemblages and gazed with admiration on their brilliant plumage and graceful evolutions, apparently indulging in social enjoyment after supplying their bodily requirements from nature's prolific fields around them. Their annual sojourn here was short, but it was during the beautiful season of Indian summer, when the scene (in my estimation) was more fascinating than at any other time; the surrounding landscape presenting a picture of matchless inanimate beauty. The foliage crowning the adjacent forest, and also the shrubbery and isolated trees along the margin, and interspersed through this pocoson, painted as nature only can, in all the colors of the rainbow, in conjunction with her numerous species and families of animated productions, presented to the sportsman and ornithologist a picture enchanting and ineffaceable.

Amid this magnificent scenery I have gazed with delight (oblivious of passing time) upon the graceful and erratic evolutions indulged in by a family or clan of this small but magnificently clad fowl, the green-winged teal, whose every movement or change of position under the glistening rays of the sun would present to the sight corruscations in conformity with the various tints and colors of their splendid plumage until we could imagine their drapery an aggregation of jewels

On those occasions I would shelter myself in some secluded spot, from which I could observe their movements entirely unobserved by them. And when I wished to retire I would cautiously creep from my concealment to avoid disturbing or alarming them.

As I invariably carried my gun on these expeditions, no doubt the mental question may present itself to some who read this: "How many did you kill?" I have never yet killed one of those beautiful little fowl which have afforded me so much pleasure. If asked how many bald pates I killed after watching (not with admiration) their piratical operations, my answer might be somewhat different; but modesty (that inherent quality universally prevalent with sportsmen) admonishes me to beware of numerical statements, thereby preventing some officious game warden from insinuating that I was indulging in hyperbole—and perhaps prove it on me.

In addition to those mentioned above, there were other feathered visitors belonging to the ultra aquatic class of water fowl, but time forbids me delineating further in that branch. Within the precincts of this pocoson or feeding resort could be found at that time all the grades and classes forming a complete chain of connecting links between the ultra water fowl and those living and feeding exclusively on the land.

The different classes or grades relatively connecting the extremes of the feathered race in one family were as numerous, and the gradient or change so slight between the intermediate members, it was difficult to decide to which part of the line of progression each belonged. In fact, there were two classes, annual visitors in that vicinity, and I have never been able to decide which part of the chain of connection they formed the links. Their visits were in the spring, during the advent of immense schools of fish, with which the rivers and creeks were plethoric, and which also constituted the principal food for these birds, the kingfisher and fish hawk. Where to place them in the lexicon of ornithology I am unable to decide. At any rate, they were there, obtained their food from the water, and were expert divers, yet I never saw one swimming or resting on the water even momentarily. Their mode of capturing their food is interesting and really exciting. As this communication is becoming lengthy, I will close with a description from personal observation of the *modus operandi* of the fish hawk in capturing its prey, with its exciting sequel, on this special occasion.

While standing on the dike separating the pocoson from Hunting Creek my attention was attracted by an unusually large fish hawk slowly flopping along about 15 or 20yds. above the surface of the creek, apparently oblivious of surrounding objects, but evidently his vigilant eye was searching every spot beneath for a suitable victim. When he had marked his anticipated prey his previous sluggish movements disappeared, and instantly his momentum was arrested and suspended in mid air with outstretched wings and no evidence of life except a slight tremulous vibration of his pinions. This position was maintained until his unerring eye had measured the distance and range of his quarry; then, swift as the lightning's flash, he plunged with closed wings beneath the surface of the water, from which he emerged in a few moments (yet I was somewhat alarmed for his safety), when he arose with a struggling captive grasped in his talons, and with an air of triumph started in the direction of a dead tree on the opposite side of the creek, on which the fish hawks frequently perched to enjoy their lunch, as it was isolated and consequently could not be approached unseen by their enemies. Alas! his anticipations of a quiet meal were doomed to disappointment. He had proceeded about halfway across the creek, exerting himself to the utmost to reach his destination, when he uttered a piercing scream and vigorously exerted his power to escape some imminent danger, the cause of which I had not yet discovered. And as it was the first time I had heard, when witnessing an incident of this nature, such a piercing scream of alarm (which was an interlude to the impending contest at the sequel), I watched with intense interest for further developments. Upon sweeping the horizon closely I discovered a dark spot rapidly approaching, which proved to be the unrelenting enemy of the hawk, the bald eagle, which no doubt had been watching the movements of the hawk from an elevated perch until the time arrived to strike. From the moment the hawk discovered the approaching winged conqueror he made desperate attempts to escape by ascending in wide circles, the eagle pursuing the same tactics. It was exceedingly interesting to watch their gyrating movements until the eagle gained the ascendant, when he plunged upon the hawk, who in his terror abandoned his fish, for which the eagle plunged again with indiscribable velocity, secured the falling fish in his talons before reaching the water, then gliding away with inconceivable celerity made through the air one of those matchless ascending curves for which the king of birds is celebrated, without flap of wing or flirt of feather.

RECOLLECTIONS OF IOWA.—IV.

"Ah, happy hills; ah, pleasing shade;
Ah, fields belov'd in vain,
Where once my careless childhood stray'd."

To those who have reached the crest of the hill from whence they can survey the beginning and the end of the journey of life, one of the sweetest pleasures is to sit down and muse over the course they have traveled, and silently contemplate the joys and sorrows, the pleasures and pains, the successes and mistakes that stud its devious way. And yet how prone we are to forget the miseries and remember only the delights of our boyhood days. Some way the clouds seem to have all floated away and left only the sunshine. Nature, for some occult reason, smooths the folds of memory, making us forgetful of wintry skies, dead leaves, yellow grass, cut fingers and cold feet, and permits us only to recall bright skies, pretty green leaves and grass, birds, songs and happiness. Yes, "nature can soothe if she cannot satisfy," and for this, if nothing more, she is entitled to a first mortgage on our gratitude. Even in those cases where pleasure and distress got so badly mixed up that we were in doubt then as to which had the better of the other on the general proposition we find no room in our hearts for doubt in after years. Memory has digested all the distresses and permitted pleasure to assimilate them.

It was March, 1862. We had passed a hard winter, with lots of cold, disagreeable weather. But now the leaden clouds were floating away, the grass was timidly peeping out from its cold bed, the bluebird was investigating the condition of its last year's quarters, the ice in the streams was breaking up, and the quack of the mallard and the honk of the wild goose were heard in the land. I got down my shotgun, stuck a bottle of powder in one pocket, a bottle of shot in another, a wad of paper and a box of caps in another, whistled up old Cola—my bull retriever—and struck out for Coon River for ducks. I wanted to get down the river two or three miles below Foster's, where I knew that some spring branches put in, and where I was sure that I would find plenty of ducks. Snow and ice were still with us, and we took the center of the river to expedite matters, and also for the advantage that it gave us over any unsuspecting birds that might be puddling along the banks. We had proceeded on our way a mile or so when I began to realize that the ice was unsafe. It seemed to be rotten, and disposed to quit business in that neck of the woods. I had taken but a few steps shoreward when with a crack and a crash it broke and let me through.

The water was deep and very cold, but I hung on to my gun and put forth my most gallant efforts to get out. After letting me through the cakes of ice had readjusted themselves, and when I came up I found myself under the ice. I thought I would surely strangle before I found a place that I could get my hand through to the surface, but I found one and tilted the cake so that I could get my head out. Then I tried to climb up, but the treacherous ice cakes would modestly give way to my weight, tilt up and let me down again. Really I do not know how I did manage to get out, but I did after a long time. And when, half dead, I pulled myself up on the snowy bank, I still had my gun and ammunition. The powder was all right, for it was in a corked bottle; and the caps were in a close-fitting tin box. Thank fortune, neither powder nor caps were any the worse for my ducking. My clothes were freezing on me, and the question at once presented itself: Should I go home? I felt that if I went home then my condition would call for an explanation, which said explanation would probably seriously affect my plans for the future.

Old Cola had quietly slid ashore at the first intimation of trouble, and, while powerless to render assistance, seemed to be a deeply interested spectator, and ready now to condole with me and offer some good advice if I could only understand him. And as a general proposition a boy and his dog understand each other. If a boy and his dog can't understand each other, who can?

I construed Cola's manifestations of pleasure as mute suggestions that we go on with the hunt. He said as plainly as could be said without words: "Pshaw! that little ducking will not hurt you; you are too brave and manly to let a little thing like that spoil all our sport; come on, let's go on down the river and get some ducks." So we went off out to a grassy place among the trees where we were somewhat sheltered from the wind, and I stripped off every dud, wrung them out as well as I could, dressed, and we proceeded on our way. We had good luck with the mallards at the spring holes, and old Cola worked with such unusual energy that I never lost a duck. Apparently he wanted to show me that I had done just the right thing in following his advice. We did not return home until night, and when we did get home my clothes were perfectly dry, and I was comfortable and warm. One never takes cold from such mishaps or exposures if they keep their blood moving by proper exercise.

When I was a boy in Iowa there wasn't a day of the year (except Sunday) that wasn't open season for some kind of sport with rod or gun. And, as with all boys, Sunday was open too if we could manage to give the old folks the slip. The only close seasons were such as our better natures suggested or felt disposed to recognize. We fished from early spring to late autumn and then speared the fish through the ice. We permitted the prairie chickens to hatch their young without molestation, but commenced to shoot as soon as the young commenced to fly.

No thought of any kind of protection for water fowl ever came into our heads. Rabbits and squirrels were outlawed by common consent, but there was a tender spot in all our hearts for poor little Bob White. Spring and autumn the prairie lakes were full of water fowl that sought refuge in the river during boisterous weather. And there in the river was where I most delighted to hunt them. And if I should undertake to tell of the countless numbers I killed it would sound too much like a fairy tale to insure general belief. But, while I made some wonderful shots, I never succeeded in scoring as many at one shot as did my friend Mr. Baumgardner. He got twenty-seven mallards at one shot.

Every autumn father and I would go with a covered wagon up to the northwestern part of the county and spend a couple of weeks or more with the water fowl, and, of course, we had great sport. The country had begun to settle up; and here and there were small patches of corn, which were, for the most part, appropriated by the cranes, geese and ducks. And in these fields I had some of the greatest sport of my life. The majority of these fields were unfenced and therefore seldom harvested by their owners. The cranes would come by thousands, alight on the adjacent prairie and then walk over into the corn. By the time they were ready to go on south there wasn't much left of it, and it generally had the appearance of having been torn to pieces by hogs. But if the owner could manage to fence his little field the cranes were "leary" and regarded it with suspicion as being some kind of a trap.

I remember one fall we made our headquarters at Mr. Francis's, up in Dallas township. There was a small field of corn about two miles north of our camp which the owner had fenced against the cranes, but the mallards gathered there nights and mornings in countless numbers. There was no house on it, only just a little, lonely prairie field, and I jumped the claim so far as mallard hunting was concerned. Probably the owner would not have objected any way, for mallards, in such numbers as I found there, were not calculated to increase his harvest to any perceptible degree.

One evening as the sun was sinking in the west I took my dog and gun and hurried away to my preserve, climbed the fence, went out in the field a few rods, tied four hills of corn together at the tops for a blind, and commenced work. I kept the dog very busy bringing ducks until it became too dark to shoot, and must have had forty or fifty fine mallards. Then I hurriedly gathered up my game, climbed the fence near the corner, and struck out for camp. Now a prairie is much the same, no matter which way you go, and while I could not observe any strange or unfamiliar landmarks, it seemed to me that it was a very long way back to camp and that the mallards were unusually fat and heavy. It became dark, very dark; but I kept on walking, and after a couple of hours became painfully aware that in my hurry I had climbed out of the field on the wrong side and was to all intents and purposes lost. But I kept on walking, waded through prairie ponds to my hips, alarming sleepy water fowl and now and then starting some animal (presumably wolves) from the long grass, and making myself obnoxious generally.

At last I discovered a light away off across the prairie and made for it. Somewhere about 11 o'clock I reached it, and found that it came from a settler's cabin on a little patch of unfenced new sod; but the settler had a dog that seemed to be savage and not at all disposed to let me approach. Finally the dog's unusual conduct brought the settler to the door, and I inquired if he could tell me where Mr. Francis lived. I felt my heart sink a little when he replied, "Yas, about nine miles east o' here." Then I had to ask him which way was east, and he came out and gave me the general direction. I wanted to get to camp, for I knew that the folks would be uneasy, and so I pulled on, still hanging on to my ducks. And maybe you think they were not heavy by this time.

After walking another hour or more I heard the faint report of a gun away off across the prairie, which I answered with both barrels. It wasn't very long before father and Mr. Francis came riding up, and what a relief it was to get rid of those mallards and astride of a horse.

The best squirrel hunt I ever had was one October day in 1863. I had two chums by the name of Seth and Cicero Dodge, who lived down in the forks of 'Coon about four miles below us. The boys were hauling wood to town and they told me that the woods down in the forks were alive with squirrels, and that if I would go back with them that evening they would get their father to let them have the next day off and we would have lots of fun. I went home and got my No. 14 muzzleloader, plenty of ammunition and my dog and went home with them. Father Dodge had built a new frame house, but it was not large enough to accommodate the family and any strangers, so Cicero and I slept out in the old log house. I shall never forget the scare we got that night. As boys will, we lay there a long time discussing the various propositions that suggest themselves to two boy chums who haven't seen each other for some time. Along toward midnight we thought we discovered the presence of somebody under our bed. To make it more certain we distinctly heard the ticking of his watch. We became uneasy, for the ticking of that watch was regular and incessant. At last Cicero quietly slipped out of bed, went over to the new house and called his father, who came and investigated. Much to our chagrin the old gentleman soon discovered that the cause of our dread and forebodings was only a deathwatch at work in an old log by the side of the bed.

That night there was a severe autumn thunderstorm, but next morning the clouds had cleared away and the sun smiled down pleasantly. There never was a more lovely morning than the morning of that bright autumn day when we three boys with our two muzzleloading shotguns and two cur dogs sallied forth after squirrels. Nature seemed lavish with her jewels, for the raindrops, still hanging to the leaves, in the bright sun looked like pure white diamonds, and all animate nature seemed to appreciate nature's pleasing display. Pheasants and quail were in great abundance and the woods seemed to be fairly alive with squirrels. I remember that we shot six fox squirrels out of one old oak that stood in the edge of a little cornfield. I never saw so many squirrels any one day before or since. We brought home nearly sixty squirrels and a number of pheasants and quail from that day's hunt, which we thought pretty good work for thirteen-year-olds armed and equipped as we were. Had we been experienced hunters armed with breechloaders, doubtless we would have bagged a couple of hundred.

Then, as now, my natural inclinations took me a-fishing oftener than hunting. We had no trout, but there were plenty of pike, pickerel, wall-eyed pike, cats, bass and goggle-eyes. It seems to me that I can recollect distinctly every fishing trip I ever took in all its minutest details. Like all pioneer boys, I had to work; and fishing and hunting trips were uncertain and limited. Of course I could go any summer evening to the river and fish for cats and goggle-eyes, but such trips were not entirely satisfactory. So in order to get the kind of fishing I most wanted I used to enter into contracts with father at the first of the week to do stipulated jobs, or what we called my "tasks," and what time I could earn by diligence and energy I might appropriate at the close of the week and use as I saw fit. Sometimes I would earn all of Saturday, but oftener only Saturday afternoons. My rods were ironwood saplings, procured from the sidehill over by Miller's Branch, peeled in the attic and allowed to season thoroughly. And they were dandies too; generally about 16ft. long, light, tough, and straight as rays of light. My lines were ordinary chalk lines, as a rule. A Chinaman always buys the biggest boots he can get for his money, and I followed that rule in buying hooks. My bait was shiners, chubs and green frogs, procured from Butler's Branch, west of us. And I generally had all these things in complete readiness, so that when my task was finished there were no particular delays in getting to the river.

To recount my fishing exploits would simply be a repetition of nearly every frontier boy's experiences; but now as I think back over my forty years' fishing experience I feel constrained to admit that I have never felt in my maturer years the same thrills of pleasure with the split-bamboo, salmon and trout that I experienced in my boyhood days with the ironwood, pike, pickerel and bass. I probably commenced my angling career when about seven years of age, maybe younger; and now that gray hairs and "crow's feet" admonish me that the time is coming when my angling will have to be done, if at all, on the other side of the great river, I look back to the good old days with the pike, pickerel and bass as about the most pleasant of my life. In those days we boys were all still-fishers. There was none of the "wasteful stravagance" of modern times—no "silver reel contrapshuns and shiny fish poles dat run riot wid money." What boy of us then ever thought of artificial flies?

Two miles above our house North Coon River divided. One arm swept around to the east thirteen miles, coming back to join the main river almost at our door. The other arm came straight down and was dammed near its mouth for milling purposes, furnishing a deep and extensive body of dead water that abounded with the finest bass, pickerel and pike. This, of course, belonged to myself and my boy friends by right of continuous and undisputed possession. At least our right was never questioned.

I remember one Saturday afternoon when I was about ten years old—in fact if I should live a thousand years that particular afternoon will never be forgotten—I had gone to the slough with my bucket of minnows and three of my best ironwood poles. I had securely planted one of my poles (not rod, Mr. Cheney) in the bank above an old submerged log where the water was probably 15ft. deep. I remember that the line on this particular pole was a brand new chalk line that Uncle Charley Rodenbaugh, the carpenter, had given me, and the bait was a big green prairie frog hooked on in a way that was neither cruel nor torturing to his frogship. I remember, too, of thinking, as I started up the river to set another pole, that that new chalk line and green frog ought to be able to seduce almost any bass in the river.

Well, I had about got the second pole set when a glance below sent such a thrill through me that I shook as if I had an attack of the ague. I think that I covered the intervening 100yds. in about five seconds. At least my short legs did their level best. The pole was bending almost double and the new chalk line was cutting the water into ribbons. I wrenched the pole from the soft bank, got astride of it and the fight commenced in earnest. Well, it was first boy, then fish; then fish, then boy; but I got him. I did not "play" him much. The "playing" was mostly on the other end of the pole. It was simply a case of a boy's strength and grit against a fish's strength, grit and cunning. The fish seemed determined to get under the old log among a lot of limbs and roots that I now for the first time observed, while I was equally determined that he should not. He was a monster. He looked like a bass, but his size made me very doubtful, and I finally decided that he must be a buffalo fish. While I was examining him and admiring the beautiful proportions and the deep green of his back and sides, Jake Van Meter, our miller (and by the way a very expert fisherman), came along and propounded the usual question: "What luck?" "Oh, not much yet," said I, "for I've only just commenced, but I guess I've got a durned old buffalo."

"A buffalo!" exclaimed Jake, "let's see him." He took the fish and examined it intently for a moment, and then turned to me and said: "My boy, you've got the biggest black bass ever caught in Coon River."

Then my chagrin turned to pride, and if you ever saw a young turkey walk in a stubble field you can imagine how I walked back to my hooks. The bass weighed about 8½lbs., and was indeed a large one for that river.

Well do I remember that afternoon's catch: Three other bass of about 3lbs. weight each, and two pickerel about 2ft. long.

There were two roads home: one was across the prairie and through father's field, the other was via Main street. Did I take the Main street road? Well, I wonder! So most of the boys saw my catch, and I remember wishing that every man, woman and child in the whole State of Iowa could see it. Dear old Coon, sweet are thy memories!

"So nature deals with us, and takes away
Our playthings one by one, and by the hand
Leads us to rest so gently that we go,
Scarce knowing if we wish to go or stay."

S. H. GREENE.

PORTLAND, Oregon.

Natural History.

WILD ANIMALS OF NEW JERSEY.

MR. SAMUEL N. RHOADS contributes to the Proceedings of the Academy of Natural Sciences of Philadelphia notes on New Jersey mammals based on personal experience had during three collecting trips in the northern portion of the State. In some cases he has added to his own observations those of people living in the localities named whose te timony was considered thoroughly reliable.

"Trip No 1 was made during the last week in May, 1893, to Nolan's Point, Lake Hopatcong, Morris county, collecting being confined within a radius of three miles from Nolan's Point Villa, on the east shore of the lake.

"The second trip included a brief stay of five days during the last week in August, 1893, at a place near Delaware Gap station, in the western corner of Warren county. Trapping was restricted to a line of woodland and meadow connecting a lake (Sunfish Pond) two miles distant with the farmhouse in which I lodged, near Delaware Gap.

"The third and most successful trip covered a period of three weeks, extending from the 6th to the 30th days of October, 1896 It included three stops of one week each; the first at Culver's Lake, Sussex county; the second at Unionville, Orange county, N. Y., just across the northern boundary of Sussex county, near the Walkill Valley; and the third at the southern end of Greenwood Lake, in Passaic county.

"The lakes of New Jersey are numerous; Culver's Lake and Long Lake together cover a considerable tract, and with their surroundings of swamps and mountains form a natural forest game preserve that is well worth the future attention of the legislators of the State. At Lake Hopatcong, the largest of all, the country is less mountainous, and the *fauna* and *flora* shade somewhat into the Carolinian elements, but at Greenwood Lake the western range of Greenwood Mountain shows the most marked Canadian features noted in the State, frequent swamps and bogs of white cedar, fir, pine, hemlock and tamarack nestling among the depressions of the summits.

"The excursions of which the following pages form a summary are part of the author's plan to make a comprehensive zoölogical survey of all the counties of New Jersey and Pennsylvania, with special reference to mammalogy and herpetology About half of this labor has been completed.

"VIRGINIA OPOSSUM.—No specimens of opossum were taken. Its rare occurrence at Greenwood Lake, where I was informed by the hunters that two had been captured in the last two years, is of interest as showing the presence of this animal in the most boreal surroundings which the State affords.

"VIRGINIA DEER.—It has been many years since one of these animals was killed in any of the localities visited. Several are confined in a game preserve surrounding Sunfish Pond, in Warren county, and a few in the Dalrymple preserve, on the east side of Long Lake, in Sussex county.

"WAPITI.—A hunter near Delaware Gap declared that his grandfather, who 'killed the last elk shot in Pike county,' Pa , stated that sometimes the hounds would drive both elk and deer across the Delaware River onto the Kittatinny Mountain. That the latter species has quite recently been known to find temporary quarters in Sussex county on this account is easily proved, and it is probable that in this manner the wapiti has either voluntarily or involuntarily become a member of the New Jersey *fauna* within the present century.

"VARYING HARE.—Once pretty numerous in the tamarack swamps of northern New Jersey, this species now seems to be exterminated. Mr. Larkin Hazen stated that he shot one about six winters ago on Greenwood Mountain just across the State line in Orange county, N. Y. They used to frequent a small swamp near Culver's Gap, but I was unable to find any trace of them there.

"WOOD HARE.—No specimens of this common species were secured. On this account I am unable to say whether the sub-species *transitionalis* is found in northern New Jersey

"AMERICAN BEAVER.—Numerous localities in northern New Jersey are pointed out as the traditional sites of beaver colonies. This animal was so early exterminated in these places that I found it impossible to secure any data relating to the time of their extinction.

"WOODCHUCK; GROUND HOG.—Very abundant on the Delaware slope of the Kittatinny Mountain; less so in other localities named, except at Lake Hopatcong.

"CAROLINA CHIPMUNK.—Forty specimens, representing every locality visited, show nearer affinities to the Carolinian than the Canadian form of our Eastern chipmunk. Those from Delaware Gap are scarcely separable from southern New Jersey examples, the Greenwood Lake series being nearest to *lysteri* of Maine, but much darker. This animal is very abundant in Warren, Sussex and Passaic counties, but not so numerous at Lake Hopatcong.

"A temperature of 28° during my stay at Greenwood Lake did not wholly silence them, though it greatly lessened their activity and apparent numbers. Contrary to what I expected, no really fat specimens were procured; and all seemed most busily intent on gathering and storing acorns at a season when they are generally supposed to go into their winter sleep. About 20 per cent. of those taken had the tail shortened or injured in some manner.

"CAROLINIAN CHICKAREE.—Numerous everywhere; abundant in the deeper evergreen forests.

"NORTHERN GRAY SQUIRREL.—Not common except in the vicinity of Long Lake. Even the former existence of the fox squirrel in northern New Jersey rests on such unreliable evidence that I am unwilling to include it in this paper.

"CAROLINIAN FLYING SQUIRREL.—A female and three young taken at Lake Hopatcong, and a male from near Culver's Lake, show no tendency to gradation with the Northern animal.

"RACCOON.—Not rare. A special object of sport among the natives of Greenwood Lake,

"CANADIAN OTTER.—The otter continues to exist in all the more secluded bodies of water in the counties under consideration. Specimens had been taken at Hopatcong, Culver's and Greenwood lakes within a year of my visits to these places

"SOUTHEASTERN MINK.—None of this species were seen. The hunters everywhere reported them scarce.

"CAROLINA WEASEL —Not common, and rarely becoming white in winter, even at Greenwood Lake.

"NORTHERN SKUNK.—Not having specimens, I am induced to include the skunks of northern New Jersey under the above name solely on geographical grounds. They are fairly abundant in the region.

"AMERICAN BLACK BEAR.—No bears were reported to me as still existing in the localities visited. The recent killing of bears at Port Jervis makes it possible that they occasionally wander into the northwestern corner of Sussex county.

"NORTHERN GRAY FOX.—Reported to be rare by hunters. Outnumbering the red species at Lake Hopatcong.

"AMERICAN RED FOX.—Numerous in the rocky, mountainous districts.

"AMERICAN TIMBER WOLF —This destructive animal was exterminated from northern New Jersey so long ago that I could obtain no definite data of its disappearance.

"EASTERN BAY LYNX.—Not yet exterminated in Sussex and Passaic counties, but very rarely taken. I have been unable to get any record of the Canada lynx for this region, though it probably wandered thither in earlier times.

"PUMA —The same remarks which I have previously made regarding the wolf are applicable to this animal."

INSTINCT AND REASON.

I HAVE been very much interested in the recent articles in FOREST AND STREAM on the "Intercommunication of Animals," and am very glad that research has been turned in that direction. The opinions of Rev Charles Josiah Adams are especially interesting, as coming from a source from which we usually look for nothing but opposition to scientific research. It has been assumed that man is the only animal having possession of "reason," while the evidences of intelligence shown by what are called "the brutes," or "the lower animals," are set down to a sense called "instinct." Now, I hold that the dividing line between the two faculties is very hard to draw and define, and were I to attempt it it would not separate man from the other animals in any way.

What is known as instinct I hold to be only "inherited experience," and it is as manifest in the new-born child when placed at its mother's breast as in any of the other mammals. It is shown in all the actions of childhood and is plainly visible in the desires which lead to the reproduction of the spec es

On the other hand, the evidences of reason, of drawing deductions from facts, of fitting means to ends, are so plainly visible in almost if not quite all other animals, from the giant elephant to the tiny ant, that we can only claim that we have reason in a higher degree, and more fully developed, than the horse or the dog I have been noting the actions of animals and their evidences of reason all my life, and had I time to recall them, and your readers patience to peruse them, I could furnish a long list in corroboration of facts already given by your other contributors. Two short examples will show that the actions described in them could in no way be referred to what is known as instinct.

When a mere boy I had a cloth cap such as boys usually wear, but of a rather bright brown color. One of my father's horses conceived a particular antipathy to that cap, and if I happened to wear it when I went to groom him he immediately twiched it off my head with his teeth, and threw it under his feet. If I wore a straw hat or any other cap, he took no notice of them, but he had evidently made up his mind that he would not have that cap thrust in his face.

Some thirty years ago, or rather more, I had a bull terrier—not one of the dogs now known by that name, but a cross between a bull dog and a Scotch terrier, with the broad head, "whopper-jaw" and bowlegs of the one, and the rough, wiry coat of the other. He was as homely a brute as one often sets eyes on, but as intelligent and affectionate as he was ugly. He would take a tramp by the leg of his trousers and walk him out of the front gate in short order, if he found one in the yard; but I never knew him to hurt one, his looks were usually sufficient, and they never offered resistance. All the while he was very fond of me and of my wife and children, with whom he was a great pet, and he usually stayed around the house, though he would sometimes go over the river to my office with me, and lie under my desk while I wrote my letters.

Now, one day, when I went home to dinner, Grip was trotting about in the front yard, and what was my astonishment to see him go to the door, stand up on his hindfeet, take the knob of the door bell in his teeth, and deliberately ring the bell for admission. What was there instinctive about that? If it was not pure reason, I never saw any shown by any action.

I will not occupy space by further instances, but merely say that when we revise our ideas of the "plan of creation" and accept the doctrine of evolution, we shall come to the conclusion that the difference in the intellectual faculties of man and the other animals is one of degree only and not of kind.

Now, as to intercommunication among animals, I know dogs can talk, for although I cannot understand what they say, I can distinguish very different tones in the inflection of their voices or "barks" on different occasions. One of my sisters who lives quite near me, in the old homestead, has a Skye terrier who is very fond of me, and knows my footstep, and always greets me with a vociferous salutation whenever I go over to see her.

If she is not down in the lower part of the house when I go in he goes to the foot of the stairs and barks in a very different tone from his first greeting of "Good morning," and if she does not come down at once he goes up to tell her that I have called. This has been repeated so often that she knows as well as I do whenever I come in the door.

Another instance of dog language I noticed some years since, when I lived at the other end of the village, in a house from which I was "burned out." My next neighbor on the same side of the street was Livingston Stone, well known to the readers of FOREST AND STREAM, and he owned a black and tan collie, not very large, but very wiry and pugnacious. My opposite neighbor, now dead, Mr. Paris, owned a white and tan collie, a much larger dog, but not so quarrelsome, and the two had several battles for supremacy, in which the larger dog was always whipped, until he got so that he would not appear in the main street without his master, and if he wanted to

go up town alone always went round the back way! Now I have seen the black and tan come out the gate, plant himself "on his hurdies," as the Scotch say, in the middle of the road, with his nose pointed to the other house, and commence a series of short, sharp barks, somewhat varied in intonation, which he kept up until he got tired, and the other dog not showing himself, trotted back into his own gate with a supremely satisfied air. He was as evidently challenging the white and tan for a fight, and perhaps calling him a coward and blackguarding him generally, as anything could be; and it got so far, and produced such "trouble in the families," that Mr. Stone wisely sent his dog out of town to a farm that he owned in Dublin, at the base of Monadnock Mountain.

The facts of small dogs calling in big ones to avenge a whipping is too well known to need repetition here; but besides the cases of conversation between dogs and horses, of which I have noticed many instances, I feel quite sure that I have known a pricked trout to warn his companions in the hole; and the crow "town meetings" I have seen are innumerable. I watched one from behind a rail fence, about ten years ago, for nearly an hour, and there was evidently important business going on, and if I had not got tired and disturbed them I might possibly have found out what it all meant.

Von W.

COYOTE CLASSIFICATION.

It is not very long ago that Dr. Merriam startled us by increasing the number of species of bears known to inhabit North America from three to thirteen or thereabouts. We were just recovering from the shock inflicted by his paper on that subject when a copy of another paper, entitled "Revision of the Coyotes or Prairie Wolves, with Descriptions of New Forms," comes to hand.

In this last Dr. Merriam announces that he finds among the coyotes three well-marked groups, containing no less than eleven geographical forms, inhabiting western North America, from the plains of the Saskatchewan to the southern end of the table land of Mexico, and from the prairies of the Mississippi valley to the Pacific coast. To those who have always believed that a coyote was a coyote, and nothing more, this is certainly a startling announcement, and one which will lead to a closer scrutiny of all individuals belonging to the small wolf tribe than has hitherto been given. It has long been a well-recognized fact among hunters and trappers and wolfers that there are greater or less differences in the coyote skins which come under their observation; but these differences have been usually attributed to individual variation, although we have heard hunters talk about hybrids between coyotes and foxes, and between coyotes and gray wolves. The red ears of some coyotes have often been referred to as indicating mixed ancestry, but it appears, according to Dr. Merriam, that there is a distinct type of coyotes which always has red ears.

The author holds that while wolves hunt in packs and follow moving herds, and in winter often perform regular migrations and roam irregularly over large tracts of country in search of food, yet these movements have geographical limitations, as is proved by the constancy with which particular geographical forms are found within particular areas. The snow-white Arctic wolf, for example, never reaches the northern border of the United States, no matter how severe the winter, and the red wolf of Texas is unknown on our northern plains. In the case of the coyote Dr. Merriam's studies go to show that except in winter, when migratory journeys take place, the distances traveled by individual wolves are not sufficient to prevent the various species and sub-species from conforming to the faunal zones.

Dr. Merriam separates the coyotes into three groups, of which the first, known as the *Latrans* group, inhabits the upper Sonoran and Transition zones and the southern edge of the Boreal. The second, known as the *Frustror* group, inhabits the lower Sonoran of Texas and probably Oklahoma and Indian Territories, the table land of Mexico at least at its southern part and the Peninsula of Lower California. The third, called *Microdon* group, inhabits the arid tropical belts of both coasts of Mexico and the lower Rio Grande region of Texas, as well as the lower Sonoran desert of Arizona, Nevada, Utah and California.

Canis latrans is the largest of the coyotes and has the largest teeth. *C. frustror* and its allies are of medium or rather large size, and have somewhat smaller teeth; while *C. microdon* and its relatives are smaller and have very much smaller teeth.

The Birds of New Jersey.*

Under this title Mr. Charles A. Shriner has compiled and the New Jersey Fish and Game Commissioners have published a handsome octavo volume, with thirty-one full-page illustrations prepared expressly for this work, and made either from specimens mounted for that purpose or taken from the American Museum of Natural History in New York city. The introduction thus explains the purposes:

"The object is the familiarizing of the every-day citizen, unused to scientific terms, with the habits and economic importance of the birds of the State of New Jersey. The study of ornithology, as suggested in books treating on the subject, is one attended with difficulties sufficient to dampen the ardor of even the more than willing student. The long and high-sounding names used in the scientific nomenclature—which even Latinizes common English words—the many divisions into families and species, and the disputes of authors as to what particular family a certain bird belongs to, have undoubtedly in the past deterred many from following a study in itself so interesting and useful. In the present treatise the author has avoided all scientific terms and designations, and has endeavored to foster a better acquaintance between the human family and its feathered friends without necessitating the medium of protracted study on the part of those who would like to know more about the birds around us. For the advanced student this book will be of no value, for in it will be found no learned disquisitions pertaining to the higher phases of ornithology; it simply purports to tell in plain language sufficient about the habits of birds to indicate their value to mankind and by plain descriptions to facilitate identification. The bobolink, with its variable plumage and merry song, is an object of interest, but that interest will be minimized to a great many when they are told that the first thing of importance to know about the bobolink is that he is a *Dolichonyx oryzvorus* of the family of *icteridae*. Scientific classification has its manifold uses, but there is something so deterrent about it to the average reader that it has been wholly eschewed in the present publication. A knowledge of the value of birds can be obtained without it.

"The number of birds in New Jersey, which either remain here all the year or whose visits are more or less prolonged during certain seasons, is very large, and a comprehensive treatise on all of them would make a ponderous volume. The endeavor of the author in the present work has been to deal with them in accordance with their importance; the transient visitor, who merely straggles into the State from adjoining territory, or who remains only long enough to secure rest and food to supply strength for further travel, has not been considered worthy of the attention to be devoted to him who remains with us at all seasons, or whose sojourn is long enough to awaken in us either an interest in his habits or a desire for his return."

* "The Birds of New Jersey." Compiled by Charles A. Shriner, State Game and Fish Protector, Paterson, N. J. Price $1.

Adirondack Wolves.

Clayton, N. Y., March 18.—*Editor Forest and Stream:* Inclosed you will find a clipping that I cut out of a Watertown paper, relating how Charley Adams, an Adirondack guide, had a desperate encounter with a dozen wolves, and barely escaped with his life:

Adams fired and killed one of the wolves. Then he did a very indiscreet thing. He pushed forward to the pack, firing twice as he struggled through the snow on the frozen surface of the lake. As soon as he came in sight the wolves made a concerted rush at him. Adams for the first time realized his peril. He fired twice in rapid succession on the oncoming animals. Then he clubbed his rifle. It was only by the most desperate fighting that he was able to keep them from doing him serious injury. Finding his rifle using up his energy in his attempts to employ it effectively, he threw it aside, and drawing his hunting knife fought with the fury of a man who knows his life is at stake. He stabbed and slashed the snarling, barking, biting wolves repeatedly. Few did he cut badly enough to incapacitate for fighting. Finding his strength failing, Adams began to call loudly for help. Fortunately for him, some lumbermen who were taking a short cut through the woods to the camp heard his cries.

They rushed to his assistance and drove off the enraged wolves. Adams, bleeding from a score of long, ugly scratches and several ugly bites, was carried to his lodge. One of the loggers, who knew a bit about medicine, dressed his wounds and made him comfortable. Adams says that in all the years he has tramped about the Adirondacks he never had an adventure equal to his experience with the wolves.

Now I'd like to ask, through your valuable paper, if any of your readers can give any information as to when the last wolf was killed in the Adirondacks. I have hunted in and near that vicinity for the past six years, and have talked with all well-known guides and hunters who make the northern part of Herkimer county their grounds, and, with one exception, I fail to find any one who believed there are wolves in any part of the Adirondack woods. Two years ago I was talking with Erwin Ackerman, a well-known guide of that whole vicinity, and he said that he had seen two years before several animals which he took for wolves while crossing the plains near the line of Herkimer and St. Lawrence counties.

H S. J.

[The Charley Adams wolf story appeared originally in one of the New York city sensational papers, and no credence whatever is to be given to it.]

Breeding Black Foxes.

Macomb, Ill., March 15.—*Editor Forest and Stream:* I send you a photo of a black fox sent to me by J. E. Knight, of Boothbay Harbor, Me , who has charge of these foxes on the island. The company imported thirty from Alaska and only seven of them lived to reach Maine. These foxes were brought from an island in Alaska where a company is breeding them. There were only sixteen hundred black fox pelts sold in London last year, and fifteen hundred of them came from Alaska. These pelts are worth $100 apiece. The black fox and the silver gray have got badly mixed in that country and it will take some time to breed the gray out so that the breeders will have the pure black fox. Should this importation prove successful I have no doubt that more islands on the Atlantic coast will be stocked with these valuable animals.

W. O. Blaisdell.

Mr. Knight wrote to Mr. Blaisdell under date of Feb. 15: "I have been out on the island the past few days. Our number seems to be good; I think we have the addition of only one litter of last season, with better prospects for this season. They have made themselves good homes, which of course they did not have when they were put on there one year ago last November. It was a strange country to them, and I fancy they did not do as well as they will in time to come. They are in good order and very lively. I have thought of rabbits many times, but it would be quite an undertaking now to get the island stocked with them, as the foxes would kill the young so fast. This winter I have killed old horses for them. They are about to commence breeding, and when the young come along the first or middle of May we shall have lots of fish then for them. The island has more or less live food on its shores, such as mussels. We have something like 100 acres well wooded, and I see no reason why the foxes will not do well after they once get started."

Migrations of Bears.

Macomb, Ill., March 23.—*Editor Forest and Stream:* I have read M Hardy's article on the migrations of animals and birds with great interest. If any man in the country knows the habits of them it is M. Hardy; for he has spent a lifetime among them. He is correct about bears migrating. When I was a small boy I heard my father say he saw seven bears cross the stream on logs at East Orland, Me., in one day. I asked him why he did not shoot them. He said it was on Sunday. He was one that believed no one would ever get to the happy hunting grounds even if they shot a bear on Sunday. Will M. Hardy give us his opinion what has become of the wild pigeons that used to be so numerous from Maine to Arkansas twenty or thirty years ago? I have written to Arkansas, Indian Territory, Red River and Arizona, but cannot get any trace of these fine game birds. Some three years ago two were killed in this county, and I understand there was a flock seen in New York State last year.

W. O. Blaisdell.

What Becomes of the Moose Horns.

Cumberland County, Nova Scotia.—As all of our big-game sportsmen know, the moose loses his antlers annually; the older moose lose theirs about Jan. 1, while the younger ones carry theirs till about the middle of March. When a new set begins to grow and while growing they are covered with a kind of hair, and the horns are then "in the velvet." This velvet they chafe off by hooking small trees in alder swamps, where they stay most of the summer, and by the middle of August the velvet is all gone from the horn; then it stops growing.

Last winter I found a set of antlers dropped a short time before, and this fall, being in the same locality, I had the curiosity to see what had become of the horns. After a good deal of search, at last I found a piece of bone from next the skull about the size of a goose egg and about the same shape. On examining the surroundings I soon discovered that the squirrels and porcupines had regular roads to the horn, from which they had had many a good meal. This is why it is that although thousands of sets of horns have been dropped in past years there are so few found.

I am very sorry to see that the law prohibitory to shooting cow moose in Nova Scotia has been repealed, as from my observations I am able to state with certainty that the moose have increased very much in the interim Some of our sportsmen said that there were not bulls enough for the cows. This shows how very little they know of the habits of the moose, and should one doubt me let him follow a big buck as long as the writer did a short time ago. I struck this noble fellow's track in the morning and never let up till dark; all of the time he was traveling up wind and had picked up four cows then and was still looking for more, with the four cows after him.

The usual way of ascertaining the age of the moose is by the number of prongs or points to his antlers—that is, should he have five points on one side and four on the other he will probably be four years old.

Moose Shank.

The Mystery of the Candles.

Fredericton, N. B.—An odd experience befell Mr. Hunter during his return from a hunting trip to the settlement last fall. One evening he left a candle burning on the table in the Forty-Nine-Mile Camp while he went out to the hovel to look after his horses. To his surprise when he returned to the camp the candle was not only extinguished, but could nowhere be found! Mr. Hunter is not entirely free from the influence of those wild, weird legends peculiar to the backwoods of the Miramichi, especially those that relate to a fabulous monster known as "the Dungarvon Hooper." He lit another candle, however, and again went out to attend to his team. When he came back to the camp he found that the second candle had vanished as mysteriously as the first! This was a severe blow to Mr. Hunter's peace of mind, but he pulled himself together and examined the camp thoroughly to see if some practical joker was not concealed about the premises. Finding no trace of anything in human form, he placed his third and last candle on the table, stood his axe within easy reach, and awaited developments. In a few minutes a flying squirrel hopped in the door, boldly mounted the table and knocked over the candle, thus extinguishing the flame. He started for the door with his booty, when Mr. Hunter took a hand in and put the little rascal to flight. Can any of the readers of Forest and Stream give evidence of any other animal known to them that has no fear of a lighted candle?

Prowler.

Snakes about New York City.

In the recently published "Abstract of the Proceedings of the Linnæan Society of New York, for the Years 1895 and 1896," Mr. R. L. Ditmars prints a list of the snakes found within fifty miles of New York city, and, together with brief descriptions of the species, gives notes on their local distribution and habits which might prove interesting to collectors. From this list we learn that sixteen species and sub-species of snakes are found within the boundaries mentioned, but that many of them are becoming quite scarce. We are told that the brown snake is quite common in rocky portions of the Central Park, as is also the garter snake. Venomous snakes are the copperhead and the black rattlesnake. The first of these is common on the Palisades, and has been recorded in Putnam, Westchester and Duchess counties, New York. The rattlesnake is found in Putnam, N. Y., near the Hudson River, and occurs also in Connecticut. It is said that a few are found annually in the central part of Long Island. All the localities named are within the fifty mile limit. Within the past two or three years we have several times seen garter snakes, and on one occasion a hog-nosed snake, on Manhattan Island south of Fort Washington.

The Mongoose in the Hawaiian Islands.

The result of introducing the mongoose into the Sandwich Islands is told in a letter written by the Commissioner of Agriculture and Forestry to Consul-General Ellis Mills:

"The mongoose was first introduced into this country about fifteen years ago. Previous to the introduction of the mongoose, the planters suffered severely from the depredations of the rats in the cane fields. At times whole fields of cane were utterly destroyed, and at all times much damage was done. The mongoose soon changed this state of affairs. In one year after the introduction of the mongoose hardly a stick of rat-eaten cane could be found. The plague of rats is now ended and we have the mongoose, who, although he loves poultry, has never been so destructive to them as were the rats.

"The mongoose are easily caught and one or two terrier dogs will keep a large premises clear of them.

"In 1892 a law was passed by the Legislature forbidding the introduction, keeping or breeding of mongoose on the Hawaiian Islands. A sum of $1,000 was set apart to be expended by the Minister of the Interior in the payment of a bounty of not to exceed 25 cents per head for each mongoose destroyed on the island of Oahu. This bounty only applied to the island of Oahu, the mongoose being considered a necessary evil in the cane districts of the other islands. None of the bounty has been paid, as no one has ever applied for it."

The Coming of the Birds.

Sault Ste. Marie, Ont., March 18.—*Editor Forest and Stream:* The first robin arrived here this morning with a gale from the southeast and rain. He looked pretty well used up, and I guess it was the unlawful doings in the United States on the 17th that made him seek a more law-abiding community.

Algoma.

Augusta, Me., March 25.—*Editor Forest and Stream:* Here are a few signs of spring from this section of the country: So far March 23 was the warmest day we have had this year, and on that day I saw a robin near the house. He was singing loudly, as if happy to get back again. A friend of mine reported that on March 22 he saw a robin and a bluebird. Bluebirds were very scarce here last year. The first flock of geese on its northern flight that has been reported this spring was seen March 22. There were about sixty in the flock, flying very low, and they probably spent the night near by.

Cushnoc.

Charlestown, N. H., March 29.—Spring is coming! Saw the first pair of robins yesterday afternoon, though Mrs. W. thinks she heard some three days ago, before the last storm. Thawing by day, freezing at night, good "sugar weather" and maple sap running.

Von W.

Game Bag and Gun.

A PLEA FOR MODERATION.

IN the following paragraphs I am about to present in a new light a most time-honored custom of sportsmen, well aware that my opinions will offend many a true gentleman to whom usage is law. I beg him to realize that the shooting traditions which I attack had their rise in times when usage sanctioned many excesses now outgrown; that while it is no longer, for instance, considered gentlemanly to lie drunk daily under the dinner table, the custom of unbridled slaughter of ducks, rail, gallinaceous birds, etc., continues inexplicably in vogue, this too in the face of threatened extermination of the game. Yet drunkenness has diminished without the agency of any corresponding menace.

The time has come for sportsmen to decide whether they will seal the doom threatened to game by wholesale slaughter, cold storage, etc., and go on making the biggest possible "bags," protected from open shame by the fact that they are all in one boat in this matter; or begin now, before it is too late, to practice in shooting and fishing the moderation which characterizes the gentleman in all other walks of life. He would feel himself a confessed boor if he gulped down madeira or port by the quart, yet he calls it "sport" to "bag" 100 exquisitely beautiful fellow beings in one day, and generally without a glance at their beauty, as each new victim is ossed into the pile.

What earthly claim to any target more sensitive than a clay-pigeon has the man who rates his day's sport by the number without any limit of birds shot. He could enjoy the fresh air or the landscape as well while shooting at his coal tar targets.

The pleasure of getting a very few birds by delicate cooperation with a good dog or a long stalk, giving one time to feel the beauty of his wild surroundings, to realize his kinship to the fox and hawk, with the growing excitement when he sees his chance approaching—these are his legiti mate delights, not to be spoken of in the same day with the coarse joys of the fashionable bagmaker.

A still more legitimate joy is that which the naturalist or artist feels when beholding safe in his hand at last the wonderful charms of a new bird or quadruped—beauties only to be studied from a specimen held in the hand. Yet it would be asking too much to demand that only naturalists should be allowed to shoot and fish, though the fact faces us all that the sportsman who sees the terrible effect of cold storage legislation must school himself at once to a much more refined sport, to four birds a morning instead of forty; to taste his sport as he would his wine. Then would he more truly deserve the name of gentleman, and also the game might last.

It is futile to hope to avert the baleful workings of wholesale slaughter and cold storage, that unforeseen monster which has arisen in the bird lover's path. God grant that it prove not quite so hopeless to summon gentlemen to do their part.

The self-styled sportsman denounces the large bags of the pot-hunter, and his snares and set lines. Yet in cases where the grounds are free to both, it is plainly the pot-hunter, with his living to get, who is most excusable.

The fact that there can always be game of the half domesticated kind in preserves offers little comfort to those for whom true sport lies, first of all, in its being a return to the romantic and primitive. ABBOTT H. THAYER.

HOURS IN A BLIND.—IV.

(*Continued from page 246.*)

The Dogs and their Work.

THE dogs used in this gunning are Chesapeake Bay dogs, brown or tan in color, and with coats long or short, straight or curly. They are admirable water dogs, and those which are well trained do work that is really marvelous.

To me these dogs look like the pure bred Newfoundlands which we used to see years ago, before the Newfoundland had been crossed with the rough St. Bernard, to give him the size which is regarded as essential for show purposes. I know that it is often said that the Chesapeake Bay dogs are a breed formed by crossing the Irish water spaniel with the Newfoundland, but I can see in the specimens that have come under my eye no trace of water spaniel character, except perhaps color, and every mark of Newfoundland. Even the color is not that of the spaniel, for we know that the original Newfoundland was often tan colored, or had tan points. The very small ears, the broad head, the short muzzle, the lack of feather on legs and abundantly feathered tail—the whole *ensemble* of the animal, in fact—to my mind point back to a Newfoundland ancestry much purer than anything we are in the way of seeing nowadays.

I prefer to believe the tradition which relates that the Chesapeake Bay dogs originated from two puppies rescued from a sinking ship which had sailed from Newfoundland and brought to Baltimore, and that these dogs are Newfoundland dogs of the old type, than which no more faithful, intelligent and vigorous breed ever existed. It may be that the race has not been kept pure, yet I think it has; for we see them generation after generation showing the same physical characteristics, the same splendid courage and endurance, and the same intelligence and love for the water.

I am told by a friend that these dogs can readily be trained to work to the gun in upland shooting, and that when so taught they display unexcelled nose and bird sense, and I regard them as most valuable dogs, and wonder that a breed so valuable has been so neglected.

The amount of work that these dogs will perform is very surprising. From just after sunrise until sundown, in cold, blustering weather, they will bring the ducks, swimming perhaps 75 or 100yds. for each one, or hunting through the thick cane for those that have fallen on the marsh. Often each trip to bring a duck is made in part over soft mud, through which the dog must wallow, as it is too thick for swimming and yet too soft for walking; often the ice must be broken for a long distance to get to the bird; often the ice is too weak to support the dog, who breaks through every little while, and then must laboriously and carefully clamber out on the breaking ice in pursuit of a cripple which is moving along toward a distant marsh or toward open water.

I have often seen a dog bringing a bird over thin ice lie down on his belly with widely spread forelegs and drag himself along inch by inch, thus spreading his weight over as great a surface as possible so as to avoid breaking through. Then, when a place was reached where the ice was stronger, he would carefully rise to his feet and trot along until the yielding ice again warned him that he must use especial care. In a case where several trials had shown a dog that the ice would not bear him, and that it was a waste of time for him to try to travel on it, I have seem him advance by bounds, springing out of the water and coming down with all his weight on the ice, thus breaking a lane through it to the bird. In this particular case the dog's stifles were so bruised by continual blows against the sharp edges of the ice that next day he was extremely sore and lame in both hindlegs.

Another bit of ice work done by another dog seemed to me to show great intelligence. A bird had been shot high in the air and had fallen heavily on thin ice 40yds. in front of the blind. It had gone through the ice and did not reappear. The dog sent out seemed disposed to cross the ice to the opposite marsh, but, called back, found the hole through which the duck had gone, but not the duck, though it was evident that he smelt it. He made several casts about the hole, but did not catch any scent, and then went back toward the hole, but when 3 or 4ft. from it stopped, looked at the ice and began to scratch. In a moment or two he had made a small hole through the thin and soft ice, and, quickly enlarging it, put his mouth down into the water, pulled out the duck, and brought it to shore. I believe his finding the duck—which had evidently had life enough to swim a little way under the ice—was pure accident; he happened to see it; but his digging the hole in the ice showed wisdom.

These dogs have keen noses. They follow unerringly the trail of a duck through the thick cane, and can trail a crippled duck that has gone ashore on the marsh to the spot where he landed by the scent that his body leaves on the water. I have seen this done many times. They understand perfectly the live decoy ducks, and swim to and fro past them without in the least regarding them, though the decoys do not seem to like it if the dog comes too close to them, and splash and quack at a great rate until he has gone by.

If properly trained, I imagine that these dogs are the best retrievers in the world; but often they are not well trained. Some dogs will bring the duck to shore and then drop it, leaving the boatman to go out and bring it to the blind; others, after bringing them ashore, will bite their birds badly, or will carry them into the marsh and leave them there. I have heard of a dog that got tired and refused to go for his birds; but, being forced to go out, swam back to the marsh with the bird, carried it into the cane, and after being gone a long time returned to the blind with his paws and nose quite muddy. A search in the marsh by the boatman revealed the fact that he had carried the duck a little way in from the shore, and had then dug a hole and buried it so completely that only one wing and the legs showed above the earth that he had heaped on it.

These dogs, like any others, require careful handling by a judicious trainer, and in addition, as they are great, strong animals, they require a great amount of work. A properly trained dog, however, is an indispensable adjunct to the point shooter, and will save him a great number of birds in a season. COUPLES.

[TO BE CONCLUDED.]

EXPERIENCES WITH STUMP BEARS.

Editor Forest and Stream:

I enjoy reading your paper very much. I find it both instructive and amusing; and when I read the article on stump bears it reminded me of my experience with one more than sixty years ago.

At that time bears were quite plenty in Vermont. We often saw their tracks in the back meadow. One day I started to find the calves and drive them home. It was after sundown and getting quite dark. I began to think about bears, and as I came to a stockyard fence I got a stake to fight with, if necessary. I walked on. "There he is—yes, there is a bear sure, just at the edge of the brush!" I had not found the calves yet, and could not think of leaving them for the bear to feast on through the night, so I walked up to Mr. Bruin—I would either kill him or drive him off. When I was within 15ft. of him I knew it was a bear, I could see his eyes shine; but just before I was near enough to strike I saw it was a stump, black, of course, leaning toward me, with two spots of snow on the top about 3in. apart for the eyes. I soon found the calves and drove them home. I got out of that scrape much better than one of our neighbors, who met a bear as he was going home one night.

It was this way: Seventy-five or eighty years ago, when the country was new "up in Vermont," where I lived, the neighbors would have logging bees, to help one another in clearing off the land. Mr. Gordon had a very nice lever made of ironwood, which he always carried to roll logs with, and as he was returning home one evening he saw a bear close by the path, standing up with outstretched arms all ready to give him a hug. Mr. Gordon was a man who would not turn out for anything, so he walked up to the bear, swung his lever and struck with all the power he had. Oh! how that hurt—the man—not the bear. It proved to be a birch stump burnt black with the bark hanging off on each side, representing the bear's arms. Mr. Gordon said it did seem to him that his shoulders were put out of joint.

Some of your readers may laugh at the idea of stump bears; let them laugh. I would like to know whether they would have the courage to walk up to one. It takes just as much courage to walk up to a stump bear as it does to face a real live black bear, and when I say this I know what I am talking about, for I have been there; yes, I have faced a large black bear in a pasture lot.

This was the way of it: I was plowing in a back lot. A neighbor came to me (all out of breath from running) and said, "Take my gun and head that bear."

"Where is he?"

"He went into Mr. Pelsue's woods."

I knew the bear would go for the mountain when he left the woods. There was a large sheep pasture between the woods and mountain; so I ran high up on the side hill and looked on the south side of the woods. There was no bear. I turned and looked on the west side. There was the bear just out of the woods. I had plenty of time to walk back and be ready to meet him as he came up the bank through the small grove. He only showed his head, dodged back and turned to run by me. Soon he came in sight again, now broadside. I took a fine sight and pulled trigger, but no report; it did not break the cap; so I pulled back the hammer and tried again; this time there was a report, and as the ball struck the bear he turned round, showing his teeth and snarling. I did not have any ammunition to reload the rifle, so I started to break it over the bear's head, but he made good his escape before the other hunters got near enough for a shot. He was the largest bear I ever saw. His track in the mud measured 7×9in. The rifle I had was a muzzleloader and had been loaded a month for a chipmunk.

I am now eighty years old, but I would like another such chance with a bear and to have our Winchester. I would say, "Bruin, you will stop with me."

I go to the Adirondacks every year now and enjoy catching the brook trout as well as I did when I was a boy. I often catch more than younger men of the party.

R. C. ALLEN.

A MINNESOTA GAME PRESERVE.

PROBABLY there are not a thousand men out of the entire population of the thriving city of St. Paul, Minn., who could tell whether or not there was any truth in the rumor, occasionally heard, that President James J. Hill, of the Great Northern Railroad, is the owner of a game preserve where buffalo, elk and other large game animals are kept. Probably not one man out of twenty whom one would meet and question regarding this game preserve could guess within a county or a State of its whereabouts, even had he ever heard of its existence. This in the city of St. Paul, within twelve miles of which exists this preserve, one of the most considerable of those of the United States, and perhaps the largest and most remarkable one west of the Alleghany Mountains. The uncommunicative nature of the owner, and his intense desire for privacy in his own personal matters, is the cause of this prevalent lack of knowledge upon the subject in his native city. It is generally known that Mr. Hill has, a few miles north of St. Paul, a large stock farm, and many would be of the opinion that the existence of this stock farm was the sole reason for the growth of a rumor of a game preserve. Over a dozen men were asked about this matter before one could be found who was able to say positively that there was really such a preserve, that there were buffalo and elk there, and that the estate was very well worth a visit

It had long been within the knowledge of FOREST AND STREAM that this preserve was a fact, and naturally the pursuit of the FOREST AND STREAM's inquiry into the game preserves of the United States made it necessary to obtain the exact facts in regard to one so notable as this was thought sure to be. Proper application being made to Mr. Hill, the latter was courteous enough to allow the necessary visit to the preserve, the news returns of which were quite beyond the expectations.

Mr. Hill's great farm of North Oaks lies directly north of St. Paul, in the pleasant lake country which adjoins that city. It is not entirely correct to call it a farm, for it is more properly a country place kept up perhaps as much for the pleasure of the owner as for the profit. At times it is used as a summer residence, and there are several residence houses upon the property, besides many barns and other buildings of very great extent. There are annually raised here several hundred head of high grade horses, fine cattle and other animals. The acreage which may be called devoted to these farming pursuits is almost entirely put down in grass. The care of the many animals demands the employment of a large number of men, and for the accommodation of these a great boardinghouse is kept up. The establishment may thus be seen to be a very large one. The property is about four miles square in extent and includes seven different lakes, some of them well on to a mile in greatest measurement. There are said to be something over 8,000 acres of land. Over this the native timber of short oaks and other hardwood trees stands uncut and wild. The whole is a great domain handsomely adapted to the purposes of the owner, among which, FOREST AND STREAM is now in position to definitely explain, was that of a sanctuary for some of the more important American game animals.

There are now upon this tract no less than 28 head of buffalo, of which 22 are full blood, 4 half breed and 2 three-quarter breed, 14 of the entire number being cows. The first buffalo were put upon the place about six years ago. Mr. S. I. Hutchinson, the superintendent of the place, was unable to tell where the buffalo were obtained, but thought it was near Kalispell, Mont., that some or all of them were bought. He was not sure, but thought it might have been from the Allard herd that they were purchased. There has been rather mixed fortune with the buffalo since they came to the place. Four head were lost by disease, one story being that they got into a clover field and ate to the point of sickness of this unusual food. This occurred four years ago. Five head, mostly of four-year-old bulls, have been killed, and it is thought that of the eight pure-blood bulls now on hand four will be killed this fall. It is believed that the animals will breed better if the number of males be reduced, for the record of the past is not satisfactory. There were only two calves this year, and there have only been eight calves in six years. The luck has been hard with the calves, for several of those born have died. Two calves and four adults died early in their experience on the farm, as above noted. A veterinary surgeon said that their death was due to the attempt made to feed them chopped oats and other grain. They are allowed to run on grass now, without much attention, and are fed nothing but hay; nor are they given any shelter except that in the winter they are allowed to take refuge, if they like, in some covered sheds prepared for the purpose. The range allowed the buffalo is over 400 acres in extent, comprising meadows, open glades and timber, all surrounded by high fence. There is no sign of depasturage on the range, and the specimens show perfect condition. One large bull which was recently killed (and which broke down four paddock fences in succession when confined away from the rest of the herd) was found to be fat and in fine order. The carcass of a buffalo brings about $300 now on the market, aside from the head and robe. Of course, there is no wish to breed the buffalo for profit, and specimens are killed only when it is thought the herd will be improved or not damaged by lessening the number of males. It is possible that some of the animals will be bought for the Yellowstone Park and not destroyed. It is a singular fact that Mr. Hill now has on his preserve probably more buffalo than are alive to-day in the National Park.

All the grade animals of the buffalo herd are the offspring of one mother, an old Galloway cow which raises a calf almost every year to a full-blooded buffalo sire. This year there is one three-quarters blood calf. The experiment has not been tried of crossing the male Galloway upon the buffalo cow. These grade animals follow the characteristics already determined as reported from other herds in captivity. The grade animal is a superb creature, of great stature and constitution, of fine outline, great beef quality and a robe of the finest and most attractive sort. So nearly as can be learned, the grade animals are the most certain of the entire

herd to do well and to increase, and there is great hope in the little herd already accumulating of these beautiful and desirable animals. It is to be expected, however, that the full bloods also will do better from this time forward, and should this be the case there is no reason to doubt that this will be one of the great buffalo herds of the country—as indeed it is to-day.

Mr. Hutchinson took us over the beautiful lake shore drive which lies between the houses and the buffalo park, a distance of about a mile and a half, and we had the good fortune to come upon the buffalo without much trouble. We saw the entire bunch of the breeds in a little glade together, as we were told they always range, they seeming to prefer their own society to that of the full bloods, though showing no hostility to the latter. With the breeds was the old Galloway cow which is the ancestress of them all. In the timber not far beyond we saw one buffalo, a grand bull apparently about four or five years old, whose heavy head, faded color and humped back contrasted, one might say, with the more shapely outline and sleek black color of the grades. This big bull stood staring at us, with his head showing over the undergrowth in which he stood shoulder deep. The grades did not seem much more bold than the pure-blood buffalo, and this entire little bunch made off at a trot through the wood after a moment of staring at us, from a distance of perhaps 100yds. It was a curious sight at this day of the world. I noticed that some of the grades had horns and some didn't, and was told that only about half of them ever had any horns, the offspring thus partially reverting to their hornless Galloway ancestry upon one side. This was an item I have never seen mentioned before in any description of buffalo crosses.

We had not time to look up the entire herd of full bloods, which were ranging further away in the woods, but were told that they all seem in good condition, and that their prosperity is thought to be assured. They are living along very comfortably, not disturbed in any way—surely not often visited by any outsider—and it is a proof of their comfort that they have fallen almost absolutely into their old plain ways. There are a number of genuine buffalo wallows, identical in every respect with those of the plains.

There are at present no moose upon the preserve, though it is the intention to try again with this animal. Three years ago there were five moose put in, but they all died, probably from scarcity of their proper food of browse in the place where they were put down.

Of elk there are now eighteen upon the preserve, ten of them cows. All these are kept together upon a fine wooded island of eighty-seven acres across the lake from the central buildings. The deer are also kept here, and the result is that the ground is fed too close, all the trees being stripped clean up to a height of several feet from the ground. It is not unusual to see an elk here standing on his hindlegs and feeding on the boughs high above his head, and they have become very expert at balancing themselves at this style of feeding. The territory allotted these animals is soon to be enlarged by a wide meadow and adjoining strips of low wood and shrubbery. The elk and deer are fed regularly in the summer on chopped oats, oats and hay, with some fodder of cornstalks. It is their custom to come at hearing the rattle of the lid of the big feed box on the lake shore, but at the time of our visit they were all hid deep in the woods. Mr. Hutchinson kindly went out hunting for them, and at length succeeded in finding them and driving them past the point where my friend and myself were concealed. It made a great sight when they came swinging by through the wood, some big full-antlered bulls leading the way. The visit was in the month of September. The antlers of the bulls were quite grown, and the tips whitened by rubbing on the trees.

The condition of the elk is most satisfactory. There were five calves this year, and the future is thought secure for these animals. One bull was killed last year.

Not so much can be said for the deer (only white-tailed deer are kept on the preserve), for the five does and single buck have failed so far to breed at all. The deer run with the elk. They are fed nothing until the heat of the summer, and the constant feeding down has divested the range of grass and browse. The old buck at the time of our visit was just beginning to take on his autumn pugnacity, and we were warned to carry a stick to "bluff" him if he showed fight. Mr Hutchinson says he is a treacherous sort of creature, and will slip up quietly and then make a sudden rush at one. I heard of no deaths among the deer. Of course the interest does not attach to them which does to other animals on the preserve, for it has already been established what can be done with the white-tail in captivity. None of the deer have ever escaped. It is the case, however, and a very strange thing it is too, that two winters ago five of the elk got away from the preserve and escaped into the country, and from that time to this they have never been heard from. This was in the heart of a settled farming country, and it seems almost impossible that the animals were not seen and reported by some one in some part of the State. There is no great tract of wild country into which they could escape anywhere within 100 miles or more. There are now no elk native in Minnesota short of the extreme northern part of the State, where a few may still exist around the edge of the Roseau Swamp. Formerly the animal was native all over the State. I talked with a middle-aged farmer seventy miles west of St. Paul, who said that seventeen years ago he frequently saw elk where his farm now is.

Every year there are many wolves (coyotes) seen about the place, especially toward spring, and of course every effort is made to kill these. Mr. Hutchinson said that he usually killed eight or ten wolves each year. He carries with him on his trips about the place a long barreled and heavy Stevens pistol, .32cal., with which he is very expert. He says that often he can see the coyotes playing about on the ice in the winter time. These animals destroy small game and killed two of the deer last year.

Attempts have been made to rear the English and Mongolian pheasants, but the results have been discouraging, vermin having killed numbers of the birds. Mr. Hutchinson thought the winters were too cold for these birds, though that is contrary to the belief accepted in regard to these birds at this latitude. They do very well in Wisconsin on about the same parallel, though it is well known that the winter of Minnesota is a rather severe affair

There are numbers of prairie chickens upon the place, probably about 100 in all, or some eight or ten coveys. The ruffed grouse is native and has increased extremely well, a number of coveys being known to the superintendent. Quail also are abundant and seem to get along very well, and of rabbits there are quantities. Miss Charlotte Hill is fond of shooting, and has an occasional day with the pinnated or the ruffed grouse. The latter are driven from cover and fly across the road where she is stationed, thus offering shooting not quite so hard as that of the cover, to be sure, but certainly quite difficult enough.

Besides these birds, properly to be called native, the wild ducks have always resorted to the lakes of this region in their migratory flight, and some ducks breed annually upon the place, where certainly they have every protection and ample room. The wild rice is luxuriant in the lakes of the preserve, and each fall the ducks come in upon the lakes in numbers, offering the best sort of shooting. In the spring these lakes are full of ducks, and an ice blind in the winter has been known to yield shooting good enough for the most extravagant desire. The birds are never harried and worked to death at any season, and shooting is allowed only upon certain days—never at dark—and certain bedding and feeding grounds are kept always untouched. In one lake alone there are over 800 acres of wild rice. It is whispered that 1,500 ducks have been killed in a week at the height of the season here by a party of Mr. Hill's friends. Thus it will be seen that a magnificent shooting preserve as well as a grand park is among the easy possibilities if desired. It is the intent to increase always the numbers of birds and animals, and not to shoot down the supply of any kind. There has been a great deal of trouble with local poachers, who have been accustomed to shoot ducks where they pleased, but this trouble has been largely obviated of late after a long and serious educational effort. The grounds are surrounded by nothing more formidable than a Page woven wire fence, but the lines of the inclosure are locally very well known.

The waters of the seven different lakes of this favored place are naturally the home of the usual game fishes native to Minnesota, especially the pike and the large-mouth bass. It is a great commentary on protection that these lakes now fairly swarm with these fish. Sometimes fishing parties of Mr. Hill's friends have great sport here, and it is of record that one catch of eighty-four black bass, weighing 241lbs., was made in May of 1895. Every effort has been made to exterminate the pike, against which ceaseless war is waged. It is common to take them of 10, 12 or 15lbs. weight, and one was taken weighing 23lbs. Last spring Mr. Hutchinson cut off with nets a certain little creek into which the pike were crowding on their spring spawning run, and killed 1,500lbs. of the despised fish with pitchforks. It is not thought best to let them increase to destroy the bass, which are more prized.

There are no brook trout upon the preserve, but there is one cold spring creek which can be made to afford a quarter or half a mile of fishing, and it is the intention to stock this with trout at an early date.

The land embraced in this interesting inclosure is of features rather pleasant than bold, the hills being low and rolling, well covered with a heavy growth of short oaks. The soil is a sandy loam. No attempt has been made at artificial beautifying, and indeed none is needed. Around the shores of the pleasant lakes driveways have been laid out, or rather roads have been worn out of the natural soil, but beyond this the place is much as nature made it. The extent of the tract may be guessed from the fact that though we drove for several miles in our looking at the game we saw almost no trace of farming operations, except as an occasional sight of a herd of cattle would indicate it. The "farm" is a big resting place for a man of big projects and great business energy. Its care and development are in good hands and the future of the enterprise is assured. This fact, if the owner will allow the belief, is matter for congratulation, not only for him, but for the public. Without the possibilities of such large-handed private enterprise, the time must come when the American people would lose all knowledge of some of the great animals which once belonged to all, and which were not kept. Especially is it to be hoped that the success with the buffalo will continue and be increased from year to year.

E. Hough.

DECOY STORIES.—IV.

Dorval, Quebec, March 20.—*Editor Forest and Stream:* I have read the letter of your correspondent, Mr. M. D. Stevens, and it reminds me of an experience of mine which may interest some of your readers. One morning in October, 1894, I rowed from Dorval across the St. Lawrence River, or rather, Lake St. Louis, to the Chateauguay shore, taking my wooden decoys and my gun, in the hope of bagging a few ducks before breakfast.

I made a very early start and reached the sandy beach, where my blind was built, before daybreak, set out my decoys and got into the blind, which was built of stones gathered on the beach, and waited for the ducks, which always come in to the spot I had chosen just as the light is creeping up.

The water before me was very shallow, and about 200yds. behind was thick bush.

While waiting I suddenly became aware that something was moving behind me. I heard nothing, but had the feeling that something was there, and I glanced over my left shoulder in time to see a shadowy form flit from one rock to another. I could not see what it was, as it was too dark but I could distinguish a something.

In a few seconds it darted from the second rock to a third, and so on, always getting nearer to the decoys, which it was evidently stalking.

There was a breeze blowing up the river, and suddenly my visitor got the breeze after it had passed me, and he left the shelter of the rocks and bolted, but not before I had seized my gun and fired a charge of No. 4 over my shoulder. It was still so dark that I could not see whether he fell, but on leaving the blind and walking up to where he had been I found him, a beautiful red fox, stone dead.

I brought him home, took him into Montreal to be skinned, and now have his skin in my drawing room, where it makes a fine show, as the brush is the largest I have ever seen.

The fox was certainly after my decoys. What a surprise he would have had if he had got his teeth into one of them!

On another occasion I saw a large brown owl come into a flock of wooden decoys, and my companion shot him.

This was on a sandbar in the middle of Lake St. Louis, two miles from the nearest land, where we had built a blind of stakes and rushes. Solitude.

[For previous decoy stories see issues of Feb. 20, March 13, March 20, and the story told by Mr. Townsend last week of "Duck-Hunting Porkers."]

The Forest and Stream is put to press each week on Tuesday. Correspondence intended for publication should reach us at the test by Monday, and as much earlier as practicable.

An Adirondack Outfit.

In our trip to Sperry Pond, Hamilton county, Adirondacks, in October, 1896, I saw more large deer in the country we were in than at any time previous. On a trip up there say about the last two weeks in October the chances of still-hunting would be better, as you are very apt to have a light snow or two and the leaves would be mostly all off. It could be made by a couple of men, without guide—the way I usually prefer, as cooking, etc., adds to the charm of camping—for two weeks for about $50 each. Such a trip I expect to take next year if the land is not posted, as I am afraid it will be.

Our outfit has been cut down to the lowest possible weight consistent with comfort, and for the benefit of any who would like to know what it is I give details for two persons:

Two .38-55 Winchesters—the buck dropped with one of these soft bullets in the neck; two leather knapsacks—we like them better than pack baskets; two pairs double woollen blankets, two rubber blankets, small muslin tent with flap, camp axe, pocket camera, extra suit of heavy underwear.

Then there will be a number of small articles, but pay a great deal of attention to them, as you will be surprised to see when they are all together how much they weigh.

The cooking tools consisted of two tin pails, two plates, two cups, spoons, forks, one stewing pot, one frying pan, and cake turner.

All this, with about 65lbs. of food, will weigh about 65lbs. for each person to carry, which can be done all right if you take your time to it. Of course, if you will be near a base of supplies the grub can be cut down; but we always go so that farmhouses or hotels can be let alone, and so that we can stay our time out without trips back for supplies.

A boat is unnecessary at that time of year unless you have a guide to carry it, or want it for the purpose our New York friend did—waiting in it with lasso and pitchfork. But don't do this. Take right to the woods. Tramp all day. Get lost a few times. Let the rain spoil your food or the squirrels and birds steal it. Get bitten with punkies. And last, get over it all, and you will enjoy woods life as well as the writer, who only wishes his two weeks were two months to spend with rod and gun. S. P. M Tasker, Jr.

Fox Trapping.

Schuylerville, N. Y.—I have taken your paper for ten years or more, and have read the same chestnuts a hundred times, and have been on the lookout for an article on fox trapping. Your paper has published points on poisoning foxes. Our country is full of foxes, and nobody kills any. On page 207, your issue of March 13 tells that they trap them in Maine. Now how do they do it? C. E. B.

[Use a No. 2 Newhouse trap, which is known as the fox trap, and follow these directions taken from the "Trapper's Guide":

"To prevent the smell of iron from alarming the game, the trap should be thoroughly smeared with blood, which can be done by holding it under the neck of some bleeding animal and allowing it to dry. Or, for the same purpose, it may be heated and covered with beeswax, which at the proper temperature will readily run all over the trap and chain. It should be set near the haunts of the fox. A bed of ashes, chaff, or light earth should conceal the trap, and it should be fastenad to a movable clog of 6 or 8lbs. weight, as directed on page 18. Wool, moss, leaves, or some other soft substance should be packed lightly under the pan and around the jaws. The surface of the earth in the neighborhood of the trap should be brushed with a quill or bush, so that all will seem natural. Scraps or small pieces of fried meat rolled in honey should be scattered over the bed of the trap, except where the pan is. Care should be taked to erase all footprints.

"Another method practiced by woodsmen is to set the trap in a spring that does not freeze over in winter, placing it about ½in. under water, and covering the space within the jaws with a piece of moss that rises above the water. A bait of meat should be placed in such a position that the fox, in taking it, will be likely to put his foot on the moss to prevent wetting it. The essence of the skunk is sometimes used in this case in connection with the bait with good effect; but most trappers prefer the preparation in alcohol above mentioned.

"Another good way is to obtain from the kennel of some tame fox (if such can be found) a few quarts of loose earth taken from the place where the animal is accustomed to uri nate. Set your trap in this material, and bait and smooth the bed as before. The fox, cunning as he is, is not proof against such attractions."]

Alabama Association.

Secretary J. H. Allen is sending out copies of the Alabama Game and Fish Protective Association's Constitution and By-Laws, with this note of invitation to join its ranks:

"It has no doubt long been apparent to you that a healthy public sentiment must be aroused in opposition to the wholesale slaughter of fish, game and song birds, or in a short time none will be left. If adequate State laws are enacted for the proper protection of our birds, mammals and fish, there will be enough for all to have some, and still have plenty for propagation.

"In a great many counties in this State there are local game laws, but in most instances they are inadequate and observed only in the breach. A majority of the States have State game laws, some of which are very rigid, and as a consequence game and fish are plentiful there.

"If we protect the fish, the United States Government will stock all our streams with an abundance of the finest fish, and if we protect the game, the natural increase will always give us enough for all our legitimate needs. Therefore if you have not already done so, send your name and $2 to the secretary, who will receipt you and enroll your name on the list of members.

"This done, use your influence among the huntsmen and fishermen in your neighborhood to induce them to be moderate and reasonable in the quantity of game and fish taken, and also prevent the destruction of young, or females with young. J. H. Allen, Sec'y and Treas."

Indiana Quail.

Fremont, Ind., March 24.—Quail were more plentiful here last season than they have been for many years; the winter has been favorable for them, and we can expect to have a good supply for next November. We know of several coveys that were not disturbed last season and have wintered well. All other game is scarce here. Going out for an occasional day's romp with Roy Rodney and my little Holenbeck, my score for 1896 was 182 quail, 46 woodcock and 10 partridges. Mc.

West Virginia's Non-Export Law.

HUNTINGTON, W. Va.—*Editor Forest and Stream:* Our new law is quite a long step in the direction of shorter open seasons, and better enforcement of our laws relative to game and fish. No deer may be killed for five years and no more hounding, no quail for two years. No bass may be caught from April 15 to June 15 of each year, and none taken under 6in. For dynamite using a jail sentence is provided, in addition to the fine which the court must impose.

No game may be sold out of the State or shipped therefrom.

All State, county and city officers are made game wardens, and upon reliable information of infringement of these statutes must act or are subject to fine. One-half of all fines go to the informer and the other to the party making the arrest.

This State possesses most excellent advantages for game fish, and where there has been no netting, and especially no dynamiting, there is as good fishing as one could ask. This law starts at last in the right direction of forbidding the sale of game outside the State, but falls short in not having adopted the FOREST AND STREAM no sale platform; but we feel encouraged and trust the latter will come in two years.

If all members of our various State Legislatures were only constant readers of the FOREST AND STREAM, soon indeed would the needed "No Sale" law be passed, and the statutes of the various States cease to be encumbered with useless provisos compromise provisions, often inconsistent and so utterly in conflict among themselves as to utterly nullify their enforcement.

Let us all try to push the good work along, and when from Maine to California, from the Atlantic to the Pacific, there is no spot upon which game can be offered for sale, none who will buy and no company that dare carry, then at last our game problem is solved and to the good work of FOREST AND STREAM will belong at least the greater part of the credit. T. R. S.

Deer and Train.

A GLOVERSVILLE (N. Y.) correspondent sends us this from his local Adirondack paper: "Deer are evidently becoming quite numerous in this vicinity, as two were recently seen near the Broadalbin Railroad, and people on the train from Northville had an interesting experience with two of the animals on its trip to this city this afternoon. The train had reached a point about half a mile south of Cranberry Creek depot when the engineer saw two deer jump on the track. After waiting until the approaching train was within about 100ft. of them, the deer turned and ran down the track directly ahead of the locomotive and maintained that position for nearly three-quarters of a mile, when they turned and passed into a field through an open gate. The engineer kept the whistle tooting constantly while the animals were on the track, and several of the passengers, desirous of learning the cause of the repeated alarms, saw the animals in their race with the train."

In Wolf Creek Swamp.

WEDNESDAY, 10:30 A. M., found four of our party standing around a small fire near the swamps of Wolf Creek, about five miles from town, awaiting the arrival of the fifth, a negro we had employed to furnish the dogs. We heard the welcome yelp of a hound in the swamp below us, and soon Joe appeared on the scene with fourteen dogs.

In a few minutes we had decided on our route, two of us taking each side of the creek, Joe and dogs in the swamp; and we were on the march. Soon it sounded as if some fort was being cannonaded. Every few minutes would hear the report of a gun, and occasionally above the sound of the 12-bores could be distinguished the loud report of my 10-gauge. At 1 o'clock we returned to the buggies for dinner, and after a hearty smack counted the game. We had twenty-seven rabbits, a quail and a woodcock. We decided that this was as many as we had any need for, so were soon on our way home. For the first time I grew tired of rabbit croquettes. A GEORGIA HUNTER.

Slaughtering Ontario Game.

PORT ARTHUR, Canada.—*Editor Forest and Stream:* The attention of the game warden for Ontario is called to the fact that moose, caribou and other game is being recklessly slaughtered in the district of West Algoma, and that although the local warden has been notified, no action has been taken to put a stop to the outrageous practice. Indians are actually peddling the meat around the town of Port Arthur, and the hides are shipped to Toronto. The Indians have no more right to kill moose and caribou than a white man, and if the practice is not stopped the large game will be exterminated. It is also reported that numbers of beaver have been taken during this winter, and that the pelts have been shipped to Toronto. The depredations have been committed principally on the Port Arthur, Duluth & Western Ry. and east on the Canadian Pacific Ry. The Ontario Government should lose no time in having the wardens put an end to this reckless slaughter. JOHN E. NEWSOME.

Game Seen on a Maine Trip.

ON our annual hunting trip to Maine in 1896 the party consisted of one lady, two sportsmen, cook and two guides. Started from Moosehead Lake Sept. 21 and arrived at Grindstone Oct. 28. We saw no game until Oct. 5 except partridges, but before coming out we saw ninety-two deer, thirteen moose and two caribou. We only took one spikehorn moose and two deer.

The moose we saw were five cows, three calves, two bulls (seen by the guides, who had orders not to shoot any), one spikehorn, taken for meat, and two seen at a distance, and supposed to be cow and bull. Partridges were very scarce. We only saw about thirty. N. F. TUFTS.

The .22cal. for Duck Shooting.

Editor Forest and Stream:

I was looking over a pile of FOREST AND STREAMS recently and noticed an article from a man in California speaking in high praise of the .22cal. rifle. What sportsman is there who would not feel greater pride in bringing to bag four or five mallards with a small caliber rifle than four times that number with a 10 gauge, if it were only customary to hunt them in that manner?

I think that a club started on some good ducking preserve to allow only the use of the small caliber rifle would soon have a large membership, composed only of the highest type of sportsmen. S. R. R.

Spesutia Island Club.

ASSISTANT GAME WARDEN GEO. W. MASSAMORE was recently a guest of the Spesutia Island Rod and Gun Club. He reports that the shooting there was fairly good. He and Mr. Henry T. Carey killed about forty blackhead ducks.

Dr. Massamore said the statements about the great slaughter of ducks at the island were overdrawn. The club has twelve members, and several of them are good shots. There are five shore blinds, and the club has two sink-boxes for use on the flats. One rule of the club is that members can only shoot half of any one day. If they shoot in the morning, they must leave the blinds at 1 P. M. If in the afternoon, they begin at 1 P. M. The club keeps a record of all the ducks killed, and from this Dr. Massamore found the following:

The club was formed 1889. The biggest kill of any day since was made by Henry T. Carey and J. W. Auchincloss. It was March 14, 1895, when they gathered 202 birds. On March 30, 1894, A. de Barry and Parker Page killed 176 on the flats. On Nov. 1 of the same year five members shot on the flats and killed 198. These are top scores.

The total records for each year, both from shore blinds and from sink-boxes, are as follows:

1889–90, 3,004; 1890–91, 3,074; 1891–92, 1,390; 1892–93, 871; 1893–94, 2,452; 1894–95, 2,084; 1895–96, 1,637; 1896 to and including March 12, 1897, 800.—*Baltimore Sun.*

The Virginia Shore.

Editor Forest and Stream:

At this writing I regret to have to report a news famine so far as game is concerned.

Our fox-hunting clubs, after a very successful season, have withdrawn their dogs. The last brant, duck and goose must have left for their breeding grounds in the far North, there now being none in our waters. Coast birds are not on hand yet, but may be expected ere long. Surely it is between grass and hay. A company of the Accomac Club men came down by our morning train in expectation, no doubt, of snipe and coast bird shooting. The famine will soon be off. T. G. ELLIOTT.

KELLER, Va., March 25.

Two Partridge Heads with One Bullet.

Editor Forest and Stream:

I had the pleasure of a hunting trip in Maine in 1896. The party made their headquarters at Turner Pond. This camp is run by Mr. Kinne, of the Birch Island House, Holeb, Me. We remained four days at Turner Pond. Our party of six got five deer. I was fortunate in shooting the heads off of two partridges with one rifle bullet, something I never heard of being done before. The two partridges were on the ground, and as they passed I shot, which I think was a very lucky shot. F. L. A.

Barnegat Duck Shooting.

NEW YORK, March 29.—Duck shooting in Barnegat Bay is at its height. I went down last week, and together with my guide, Mr. J. B. Boyden, of Waretown, N. J., killed thirty-nine broadbills, eleven brant and sixteen sheldrakes in three days. The bay is fairly alive with ducks, geese and brant, and any information about the shooting would be gladly furnished. A. SCHOVERLING.

GAME LEGISLATION AT ALBANY.

WE give a synopsis of the game law measures introduced in the New York Legislature during the current session. The bills are designated by their introduction order.

In the Assembly.

No. 24. Mr. Sanger—To forbid jacking deer at any time.

No. 47. Mr. Hobbie—To forbid hounding deer in towns of Dresden and Putnam, Washington county, for ten years.

No. 48. Mr. Hoes—To permit ice-fishing for pickerel, bullheads, catfish, eels, perch and sunfish in Queechy Lake, Columbia county.

No. 80. Mr. Sanger—To repeal Sec. 249 (the game selling section).

No 185. Mr. Matteson—To protect minks, skunks, muskrat in Cattaraugus county, May 1 to Nov. 16; and foxes, May 1 to Sept. 30.

No. 189. Mr. Nixon—To forbid taking any fish in Chautauqua Lake from May 1 to June 15; or any black bass, yellow bass, rock bass and muskallonge, except from June 15 to Dec. 1.

No. 190. Mr. Nixon—To protect State nets while in use.

No. 191. Mr. Nixon—To protect woodcock, partridge, rabbit and squirrel in Chatauqua county, except from Sept. 15 to Dec. 31.

No. 252. Mr. Clark—To make "the waters of the Thousand Islands" bounded by "the boundary line between the State of New York and the Dominion of Canada at Saint Regis."

No. 276 Mr Glen—To repeal Sec. 249, but without application to game already in possession at time of passage of act.

No. 360. Mr. Corrigan—To repeal Sec. 249.

No. 476. Mr. Witter—To protect woodcock, meadow lark, grouse and squirrels in Tioga county, except from Sept. 15 to Dec. 15, and to prohibit their export for sale.

No. 500. Mr. McLaughlin—To make the open season for woodcock and grouse Sept. 16 to Dec. 1.

No. 510. Mr. Hutton—To make the open season for black bass in Lake George and Schroon Lake July 1 to Dec. 31. (It is now Aug. 1 to Dec. 31.)

No. 10. Mr. Sanger—To make open season for squirrels Sept. 1 to Nov. 15. (It is now Oct. 15 to Feb. 15.) To make open season for hare and rabbit Oct. 15 to Feb. 15; woodcock and grouse, Sept. 1 to Nov 15, with season of possession Sept. 1 to Dec. 1; to forbid transportation of woodcock, grouse and quail, except when accompanied by owner, and provided that no individual shall transport more than fifteen birds at one time or fifty in a season.

No. 23. Mr. Sanger—To prohibit entirely the hounding of deer.

No. 521. Mr. Post—To permit use of floating devices and sailboats for wildfowl shooting "in Long Island Sound, Great South Bay, Shinnecock and Peconic bays." (A law.)

No. 579. Mr. Graves—To protect mink, skunk, muskrat, in Oneida and Madison counties, May 1 to Oct. 31; and fox, May 1 to Sept. 30.

No. 677. Mr. Goodsell—To make close seasons for Orange county: woodcock, grouse, Jan. 1 to Aug. 15; quail, Jan. 1 to Nov. 1; hare, rabbit, gray squirrel, Jan. 1 to Oct. 1.

No. 705. Mr. Coughlin—To forbid possession of living birds protected by Sec. 78 (song and insectivorous birds).

No. 724. Mr. Brown—To increase the number of game protectors and foresters (from present thirty-five) to forty-one.

No. 726—To appropriate $6,000 for erection and maintenance of a food fish hatchery on one of the inland lakes.

No. 220. Mr. Clark—To limit nets for taking minnows for bait to 40ft. length, 4ft. depth, and hauling ropes to 50ft.

No. 459. Mr. Hobbie—To authorize protectors to serve summons issuing out of justices' court; also giving right of search without search warrant.

No. 778. Mr. Hobbie—To exclude brackish water from the term "salt water" when used in the law relative to fishing.

No. 346. Mr. Horton—To permit in Wayne county waters taking of perch, bullheads, suckers, catfish, eels and sunfish for home consumption.

No. 248. Mr. Ives—To make open deer season Aug. 15 to Nov. 15; to forbid for five years use of jack light or hound; season for squirrel, Sept. 15 to Nov. 30; hare, rabbit, Sept. 1 to Dec. 31; woodcock, meadowlark, grouse, Sept. 1 to Dec. 1; possession, Sept. 1 to Dec. 1; hare, rabbit, squirrel, woodcock, grouse, meadowlark may not be killed for score in a side-hunt; woodcock, quail and grouse may be transported only when accompanied by owner, and only twelve at a time.

No. 812. Mr. Brown—To provide a food fish hatchery in Hamilton county.

No. 834. Mr. Coughlin—Provides that nothing in law shall be construed as forbidding possession, transportation or sale of elk meat from Oct. 31 to Dec. 15.

No. 835. Mr. Gott—Relative to duty of peace officers to report law violations to district attorney.

No. 867. Mr. Andrews—To make close season for meadow hens, mudhens, gallinule, water chicken, grebe, *except* Aug. 16 to Dec. 31.

No. 875. Mr. Rounds—To permit ice-fishing in Owasco Lake.

No. 897. Mr. Pierce—For a food fish hatchery in the town of Schroon, Essex county.

No. 364. Mr. Garby—Open season on woodcock and grouse in Richmond county, July 4 to Dec. 31; and on meadowlarks in Niagara and Richmond counties, Sept. 15 to Dec. 31.

No. 365. Mr. Garby—Open season for squirrel, hare, rabbit, Oct. 15 to Dec. 15; in Richmond county, Nov. 10 to Dec. 10; and rabbits protected during 1897.

No. 485. Mr. Meyer—To provide for salt-water striped bass close season, Jan. 1 to May 1; lawful length, 8in.

No. 975. Mr. Hobbie—To forbid pollution of streams in a measure to interfere with the habits of fish.

No. 995. Mr. Nixon—To amend Sec. 132 so that Lake Erie nets may not be used within one-quarter mile of the shore in Chautauqua county (one-half mile elsewhere).

No 785. Mr. Gott—To make open season for trout April 16 to Aug. 31.

No. 949. Mr. Whritner—To make open seasons in Rockland county: woodcock, July 1 to July 31, and Oct. 1 to Oct. 31; partridge, quail, rabbit, squirrel, Nov. 1 to Dec. 31.

No. 1014. Mr. Dudley—To forbid Lake Ontario netting within one mile (now three miles) of mouth of Niagara River.

No. 1015. Mr. Dudley—To permit drying nets on shores of Lake Erie, Lake Ontario and Cattaraugus Creek.

No. 1017. Mr. Halbert—To protect quail in Chemung county to 1898.

No. 772. Mr. Burr—To permit the sale in New York city of trout taken on Long Island between March 29 and April 16.

No. 916. Mr. McLaughlin—To make open season on black bass June 30 to Dec. 31.

No. 1079. Mr. Zimmerman—Relative to nets in Lake Ontario and other waters.

No. 1132. Mr. Eldridge—To forbid in Lake George trolling from launch propelled by steam, naphtha, gasoline or electricity.

No. 1140. Mr. McLaughlin—Authorizing removal of Beaverkill hatchery to another site in Sullivan county.

No. 774. Mr. Eldridge—To protect fish in Warren county.

No. 1186. Mr. Palmer—To protect bass in Crystal Lake, Rensselaerville, for two years.

No. 1221. Mr. Ives—To protect elk.

No. 1230. Mr. Ten Eyck—To forbid the sale of woodcock and grouse at any time.

No. 1231. Mr. Ten Eyck—To increase fine for trapping to $25 for each bird so taken; or imprisonment, $1 one day.

No. 1232. Mr. Ten Eyck—To limit transportation of woodcock or grouse by any one person to twelve at one time.

No. 627. Mr. Husted—To forbid in Westchester county shooting of game from public highway.

No. 320. Mr. Benham—To permit 600ft. set lines in Canandaigua Lake.

No. 480. Mr. McLaughlin—To permit ice-fishing in Sullivan county waters not inhabited by brook trout.

No. 863. Mr. Gorham—Relative to ice-fishing in certain waters in Putnam and Otsego counties.

No. 1106. Mr. McKnight—To exempt from protection, on Long Island, Wilson's or English snipe.

No. 1314. Mr. Abell—To forbid the sale of wild bird skins with plumage thereon.

No. 1355. Mr. Sweet—To permit ice-fishing in trout waters in Greene county from Dec. 1 to Feb. 15.

No. 262. Mr. Mackey—To permit ice-fishing in trout waters in Delaware county from Dec. 1 to Feb. 15.

No 680. Mr. Hill—To increase the number of protectors from thirty-five to forty-two.

Rec. No. 101. Mr. Wilcox—To exempt the waters controlled by the Oneonta Water Works Company from the provisions of the fish law.

No. 1404. Mr. Ten Eyck—To make open seasons as follows: Deer, Sept. 1 to Nov 15 (not to be shot at between 8 P. M. and 6 A. M.); black and gray squirrels, Sept. 15 to Dec. 31; hares, rabbits, Sept. 15 to Dec. 31 (use of ferrets not forbidden); web-footed wildfowl, including geese and brant, Sept. 1 to April 1; woodcock, grouse, Sept. 15 to Dec. 31 (only twelve of either birds transported at a time in company of owner); meadow hen, gallinule, water chicken, grebe, Aug. 16 to Dec. 31; salmon trout, landlocked salmon, April 1 to Sept. 30; black bass, May 30 to Dec. 31 (unlawful length, 9in.); pike, pickerel, wall-eyed pike, May 1 to Jan. 31; salt-water striped bass, May 31 to April 1 (lawful length, 8in.).

In the Senate.

Int. No. 45. Mr. Daley—To permit ice-fishing in Queechy Lake, Columbia county.

No. 96. Mr. Nixon—Assembly No. 187.

No. 108. Mr. Raines—To permit spear and set line fishing in Canandaigua Lake.

No. 172. Mr. Raines—Same purport as No. 108.

No. 184. Mr. Munzinger—To repeal Sec. 249.

No. 287. Mr. Krum—Same as Assembly No. 459.

No. 313. Mr. Davis—Same as Assembly No 705.

No. 349. Mr. Guy—To make open season for possession and sale of venison Aug. 16 to March 1; open season for killing squirrels and rabbits, Oct. 15 to March 1; wildfowl, except geese and brant, Sept. 1 to April 1; quail, Oct. 1 to Jan. 1; possession of woodcock and grouse permitted from Aug. 16 to March 1; quail, Oct. 1 to March 1; snipe, plover, shore birds, at all seasons. Repeals Sec. 249.

No 363. Mr. Wilcox That Commissioners may give privilege of drawing off waters for taking carp, pickerel and other fish.

No. 415. Mr. Lamy—To increase the number of protectors from thirty-five to sixty.

No. 423. Mr. Stranahan—As to nets in Lakes Erie and Ontario.

No. 461. Mr. Krum—To open snipe and shore bird season on Long Island April 1 (instead of July 1, as now).

No. 523. Mr. Brown—To permit taking suckers, pickerel, bullheads, catfish, eels and sunfish at any time with spear, tip-up, hook-up or set lines, in Wharton, Butternut, Schenevus, Otego and Oaks creeks and Susquehanna River, in Otsego county.

No. 537. Mr. Harrison—Assembly No. 459.

No. 623. Mr. Coggeshall—To stock waters of Oneida county with game fish; to prohibit fishing except with rod and line; to establish a fund, to be deposited by the Central New York Fishery Association with the treasurer of Oneida county, for payment of rewards for information leading to conviction of offenders.

No. 643. Mr. Mullin—To regulate net fishing in lakes Erie and Ontario.

Rec. No. 118 Assembly No. 459.

Rec No. 115. Assembly No. 220.

No. 819. Mr. Grant—To move the Beaverkill hatchery.

No. 822. Mr. Grant—To make black bass open season June 30 to Dec. 31.

No. 443. Mr. Grant—To permit ice fishing in Queechy and Conesus lakes; hooking and spearing suckers in Onondaga Lake, waters of Cortland and Tioga counties, Delaware and Charlotte rivers, and tributaries in Delaware and Sullivan counties; ice-fishing in Schoharie River and tributaries in Schoharie county; use of set lines, tip-ups and hooks for suckers, catfish, eels and sunfish in Wayne county at any time.

No. 601. Mr. Davis—As to woodcock and grouse—open season, Sept. 1 to Dec. 15; one person may take only thirty birds in a season; possession allowed Sept. 1 to Jan. 1 for birds killed in open season or out of the State; transportation forbidden except for not more than thirty birds accompanied by owner; importation forbidden in open season except from points twenty-five miles beyond State lines.

No. 874. Mr. Guy—To make close season for wildfowl Oct. 31 to May 1, and to forbid taking except with shoulder gun.

No. 893. Mr. Krum—Open seasons: for squirrels and rabbits, Sept. 1 to Dec. 31; Richmond county, rabbits, Nov. 10 to Dec. 10 (1897 closed entirely); Westchester county, squirrels and rabbits, Oct. 15 to Nov. 1; Tioga county, squirrels, Sept. 15 to Dec. 15. Ferrets forbidden except in Wayne, Onondaga, Delaware and Oswego counties.

No. 887. Mr. Koehler—To prohibit net fishing in Jamaica Bay, Flatlands Bay, Grassy Bay and adjacent waters opening into the ocean through Rockaway Inlet.

(*Correspondence Forest and Stream.*)

ALBANY, March 27.—The Senate has passed these bills: Senator Parsons, providing for the preparation by the State of a text-book on birds for use in schools, academies and colleges, setting forth the economic value of birds; Senator Malby, authorizing the killing of dogs that will hunt or pursue deer, when found running at large in a locality inhabited by deer; (977) Senator Grant, relative to fishing through the ice; (978) Senator Davis, relative to the Ulster county forest preserve; (979) Senator Davis, relative to the season for grouse; (1,017) Senator Krum, providing for the publication of the game code as amended.

After a final hearing, the Assembly game committee reported the Ives bill prohibiting the hounding of deer for five years after June 1, 1897.

The following new law has been signed by the Governor: Assemblyman Nixon, making it unlawful for any one but employees of the State Fish and Forestry Commission to take fish from a State net or to fish within 100ft. of any such net.

The Assembly has passed these bills: (834) Assemblyman Hobbie, relative to protectors' right to search; (1,692) Assemblyman Benham, relative to fishing in Canandaigua Lake; (1,093) Assemblyman McLaughlin, relative to fishing through the ice.

The Assembly has ordered to a third reading the following bills: Assemblyman Holbert, relative to the close season for quail; (1,713) Assemblyman Gorham, relating to fishing in Otsego county; (1,719) Assemblyman McKnight, close season for plover and other birds.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in Forest and Stream.

FISHING WITH A HAND LINE.

To-day, March 14, is a typical March day for this latitude, example of all that is disagreeable in what we have learned to expect as March weather in New England.

I had been gazing out at the fine sleet and snow as it came snapping against the window pane, and shivering a little as the raw air crept in around the casement, thinking as I did so of another March day only a year ago, and remembering longingly the red, pink and white roses clambering all around the porch railing that day as I stood in the sunshine cutting them, until my basket could hold no more.

To forget the weather and memories of other days I took up a late number of the Forest and Stream. First I read Mr. A. N. Cheney's letter regarding Long Lake and his reminiscences of Dr. Todd. Mr. Cheney never writes better than when he is reminded of his boyish pleasures, and I like best of all to hear or read of those "days of his youth," and to remember that a dear old friend of his once said to him, "Well, you will always be a boy!" and his reply to me, "I hope so."

Turning to another page, I found Mr. Mather's recollections of his old companion Charles Bell, and again was I led back to the land of rustling palms and unceasing sunshine by his words, which recalled my first and last experience fishing with a hand line.

It may feaze some lordly man to know of this episode, as confirming his opinion that "women are not true sportsmen, or ever really in earnest in their attempts, therefore not much use on fishing trips anyway."

I am familiar with this kind of remarks and have always intended proving their injustice, but that "the exception may prove the rule" I will admit that once perhaps I failed, and possibly deserved some of the contempt lavished upon me.

Mr. Mather quotes John Atwood's sneers at "fishing with a pole" when he said: "There ain't no fun in it, for you h'ist 'em out too quick with a pole. Throw that away and take off your float; rig yer sinkers below the hooks, and when you get a fish haul 'em in, hand over hand, and feel 'em wriggle all the way in; that's sport!"

Mr. Mather continues: "Writing of this brings a desire to fish that way once more. Bait the hooks with good-sized worms, spit on the bait for luck, whirl the sinker three times by the right side and let it go just on the upward start to plunk in the water at the proper distance, running out the neatly coiled line at your feet, and then, taking in all the slack, wait for a bite. Nibble and strike, nibble and strike; 'I've got him!' and then haul in fast, with the fish sending electric thrills up the line, and all the while you are nerved up by wonder as to the kind of fish and its probable size. An eel of 2lbs. makes you think you've got the biggest perch that ever swam, and your heart beats fast until you see what it is, and then, with all your care, the beast puts knots in the line in a minute that will take you a long time to untangle, and you knock satisfaction out of him with your heel. * * * Verily, looking back upon my life as an angler, 'there seems to have been no sport like this'."

I can hardly agree with Mr. Mather in recalling my experience with a hand line, and wishing that I might fish that way once more, for next time I shall surely take "a pole," but I can say with him: "Verily, looking back, there seems to have been no sport like this."

That fateful morning when at breakfast Mr. Jones, Mr. Giles and my brother Robert had announced their intention of going to fish on the beach over on one of the islands across Sarasota Bay, they ended by saying: "Why don't you come too? There will be plenty of room in the sailboat. You could bring Maggie with you, and you and she could gather shells. It would do you good and give her something to relate to her Vermont friends."

Accepting the invitation, I promised "to be ready on time," and they went on with their plans for the day. During the conversation I had seen the longing look in the eyes of Eugene, our attendant "gentleman of color," and realized that in the devotion with which he urged upon me another chop and hot coffee, and his immediate haste in clearing the table, meant a mute appeal to be taken too.

As the men went for their fishing tackle I arranged with Maggie and Eugene about the luncheon, ending by saying to the latter, "Eugene, we will need you to go with us, I think." His look of joy was delightful to see, as he answered, "Madame, I was just thinking it would be much better if I could go and serve the luncheon for you, and you know I have learned to row a little since I have been here and— (I knew this last to be not the least) madame, I have never been out in a sailboat, and I feel it will be the pleasure of my life."

Eugene's stately manner and grandiloquent speeches were always a delight to me, though somewhat a mystery, afterward explained, however, by some Atlanta friends, who overheard him quoting to me, "Miss Lulu Hardin, madame, always left everything for me, and for the eleven years I was Judge Hardin's butler I gave perfect satisfaction." This was an old story, brought forth always by any criticism, so I paid but little attention, but my friends said, "Now we understand; Judge Hardin is a gentleman of the old school courtliness, and Eugene unconsciously copies his manner and voice even in everything he says. His extreme politeness and formality, which in some way reminded us of some one, have puzzled us; but they are all copied after Judge Hardin, we can now see."

Trusting Eugene and Maggie to provide for the inner man, I hastened to array myself in a wide-brimmed hat and short gown, and to hunt up a camp-chair, for experience had taught me the folly of going a-fishing with these particular men without resources and comforts of my own, having found their devotion to last only until the fish began to bite.

Soon we were all together on the broad piazza watching the hoisting of the sails of the pretty Minnie, that had rocked so lazily and enticingly for nearly a week near the dock in front of the house. The pelicans nodded wisely to us, diving for their prey in a way to tantalize us, while over their heads hovered the saucy gull, hoping to snatch their catch. Old Tom, Mr. G.'s dog, chased the buzzards, while Toddy, our own Northern pointer, besought with eager brown eyes and thumping tail to be of the party.

March winds, sleet, snow-laden mountains, work, worry and weariness are forgotten as once more I am on the Minnie, watching the distance increase between us and the roses and our approach to the shell-strewn beach, upon which the water glistens and foams so prettily, washing up new treasures with each rush and flash. We could see the dark shadows of the redfish as we neared the shore, and grew impatient with wind and tide. Finally landing, all too soon for me, as the exhilaration of the sailing is beyond the excitement of the fishing, everyone hastened to get ready their rods and lines, when it was discovered that no one had thought to bring a rod for me. The channel bass and bluefish were to be seen coming in, and that the others might lose no sport I said: "Never mind, go on with your own fishing. Maggie and I will hunt for shells." As we walked briskly on the long, hard beach, how I wished for a bicycle. There one could ride for miles, and fall too if you liked, with no fear of dust or comments.

The success of the fishermen led us back to watch them, and finally aroused my envy and a desire to try my luck; so I accepted meekly an offer of a hand line, and there is where I made my mistake. Had it not been for that wretched hand line I would yet be able to hold my head up as a fisherwoman of at least moderate skill.

Baiting the hook with a piece of mullet, laying the line carefully in coils on the white sand, and whirling it until it had gathered the momentum to take it away out into the deep water, I waited to rival the poor men fishing with "poles." Now and then a jackfish or a cavaillé would give a tug on the line, but they were rejected for a more desirable return. The monotony of this became tiresome, so I resolved upon greater ease. Asking Maggie to hold the line a moment, I sought my camp-chair, novel, umbrella and a short stick.

Taking one turn of the line around the stick, I stuck it into the sand before me; another turn of the line around my right arm secured it beyond a possibility of slipping; then holding the piece of board upon which the line had been wound in my lap, and umbrella in one hand and book in the other, I sat down upon the camp-chair feeling I could enjoy my book and waiting for the fish at the same time.

Hardly had I begun to congratulate myself upon knowing so much better than the others did how to be comfortable than there came a nibble. Dropping my book and umbrella, I grasped the board with my right hand and reached forward with my left to draw in the line; this was answered by a twitch, my pull being responded to by a series of jerks, yanks and jumps—until, even though holding on with all my strength and standing where the water washed up over my feet, I felt the line slipping through my grasp until the superior strength at the other end of the line caused it to cut through the thin sleeve of my cotton gown like a knife. With an effort I managed to untwist the line and release my arm, when at the same instant my fish gave a huge jerk, I felt the line go like a flash through my hands, another twitch and I stood gazing at my empty hands trying to decide how it had all happened.

Now comes the sad and bitter part of my story. Instead of a proper concern for a possibly mutilated arm, I have to record the most unfeeling remarks which broke in upon my reverie, upon the uncertainty of life and all things in general. My brother, who should have spoken with love and sympathy, instead said: "What on earth did you do that for? Where's your line? What did you let go of it for?" etc., etc.

I meekly said: "It hurt; I only wanted to free my arm—and—and—I don't know where the line is—"

"No matter if it did; you should have hung on," was the unfeeling answer.

His friend Mr. G., whom I had heretofore admired as most generous, courteous and appreciative of men, now proved his insincerity by squarely and openly joining my brother in his tirade. His wail was all for his precious hand line: "The very best one I had, and I thought you knew enough to take care of it." Ending by a last most unkindest cut of all: "That is about what I would expect of a woman who tried to write a book about fishing, though I did think you knew something."

My protest about their indifference if I had been dragged to a watery grave fell upon callous hearts. They thought only of that miserable hand line and my folly in losing a big fish; and there under the fair Florida sky, within sight of the pretty home and where we had peacefully dwelt among the roses, we "scrapped;" and even Mr. Jones, who had always been on my side in any previous differences, sat mute on the dry sand, and with a look of sad reproach which was not broken by any appeal of mine for defense.

While I stood there one "lone, lorn woman," against those "three wise men," away out on the water I saw the tiny brown board upon which the line had been wound, and to which one end of it was yet attached. There it was, floating and bobbing up and down with the waves.

Eugene had just gone out in a rowboat. "Oh, Eugene! Eugene!" I called, "get it, quick! see there! and there!" As I pointed he looked puzzled, but finally understood and started after it. A long chase it was. Now here, now there, could be seen the little board, while my tormentors chanted in my ears: "Oh, he'll never get it; that line and fish are gone; a great fisherman you are!" in tones of contempt which echo in my ears even yet.

Meantime faithful Eugene rowed clumsily hither and yon, learning rapidly in his attempts to catch the coveted board. Encouraged by my persistent appeals and directions from the shore he finally grasped it; then came our turn to wonder! Too far out for us to see ought but his movements, we could only watch him pull and pull on the line, as he followed the fish apparently this way and that, until finally it seemed to be under the boat. After a long contest, we saw him stand upright, raise an oar, and beat with mighty blows at something in the water. After an evident struggle this method of attack ceased, and we could see him dragging something heavy into the boat, and then we knew that the precious hand line was safe and could be returned to its wrathful owner. So I speedily began to triumph over my brother, saying, "After all my fish will prove the largest one caught to-day."

"Your fish!" they both scoffed, "your fish! We would call that Eugene's fish!" And they persist to this day that the shark I hooked on the borrowed hand line was Eugene's fish, and that I deserve no credit whatever, though I yet claim rare good sense in releasing my arm, and not following out into the "briny deep" that wily shark, and that I did hook the biggest fish of the day I yet maintain.

But I warn any who "go a-fishing" there are times when you may hear plain truths of yourself, and my one day's fishing with a hand line has caused me to become a skeptic regarding any man's compliments; for this one hand line taught me the shallowness of the supposed admiration of one man and the obstinacy of a brother who joined in condemning my skill and judgment.

Over the luncheon we all "made up," and they promised never to forget my "pole" again, and in spite of this combination against me I look back upon a happy day, and would I could bring to you who read a vision of the curving shore, soft, clear air, wonderfully tinted water reflecting the glory of the sky, lines of Spanish bayonets guarding with their white covers the dark green of the mangrove bushes, and the restfulness of it all which made a "joy of mere living" notwithstanding the "hand line."

Manchester, Vermont. Mary Orvis Marbury.

Moral—Never wind the hand line around your arm, lest you be dragged away to sea. I knew of a woman who wound one around her waist when fishing on the shore, hooked a jewfish and it—but "that's another story," as Kipling says. M. E. O. M.

THE MYSTIFYING WAYS OF TROUT.

Seattle, Wash., March 20.—*Editor Forest and Stream:* W. A. Hardy, of the Hardy Hall Arms Co., is a keen sportsman who tells lots of good stories. One of them is as follows: "All fishermen know that the trout is 'wily,' especially the old whale who has felt the prick of the hook; but I had an experience on Nason Creek, an affluent of the Wenatchie River, near the Great Northern Railroad's Cascade 'switchback,' which seems to indicate that a big trout may be a big fool. I had been lazily whipping the stream one warm August afternoon when I came to a deep pool about 30yds. round, down the middle of which an undulating ripple marked the channel in the otherwise smooth and oily surface. Vine, maple and alder branches overhung the sides except where a little sandbar put out about 3ft. from the shore at the head of the pool. Standing on this bar, I cast over the pool without a rise. It looked too tempting to pass by hastily, so I put a bit of squirrel meat on my fly, attached a demijohn cork to the line, cast over to the rippling channel and let the current carry the floating line down to the end of the pool. As I reeled in the line came quartering back up and across the pool toward me. At about 15yds. from where I stood I heard a splash, as of a muskrat, but as I was not watching I reeled in and cast again. Again there was a splash at the same place, and watching, I saw a broad tail swat the cork, which danced from the blow. Again I cast, and again the big fellow's tail whacked the cork. Taking off the cork, I cast the fly—a No. 6 professor—at the spot where the fish had risen before. This time he broke high out of water and came down on the hook. I struck hard from a free reel, and braced for a hard fight. To my surprise he took no line, and I reeled in quickly, feeling the chagrin of loss as I felt no weight; but when the fly reached the sandbar on which I stood there was the fish, who came right ashore without a motion. I lifted him up, put him on the bank, took the hook out of his mouth—he was hooked fairly in the gristle of the upper lip—felt him all over to see if he was sick, opening his gills to see if they were pale, took out my knife to open him, and not till then did he move. Move he did, giving me a lively two minutes to hold him down. After I had killed and bled him I opened him and found a 5in. field mouse half digested in his stomach. Apparently the fish was sound as a dollar. I know he was fine eating and fat. He weighed 3lbs. 2oz., and what I want to know is why he came ashore without resistance unless he was a fool?"

Speaking of foolish fish, I saw a bird temporarily insane once, I believe. I had been wandering over the beaches on the Wenatchie divide after an unsuccessful pheasant hunt. Seeing a big red-headed woodpecker on a yellow pine, I let go my .22 Marlin at him, and knocked him down. Going to pick him up, I saw the bird climb the tree from the ground, and when he was about 10ft. up he began to peck as fast as he could, and to screech like the deuce at the same time. He paid no attention to me, but kept on pecking and screeching in spite of my efforts to reach him. I finally succeeded in getting him, but he still pecked and screeched. I couldn't imagine what was the matter until after wringing his neck I examined him, and found that the bullet had simply scraped the skull, producing I suppose concussion of the brain at first and a temporary insanity, so to speak.

Living in the State of Washington, where streams are plentiful and nearly every stream is full of trout, my business and my pleasure the past seven years have led me to spend much time "where the trout lurk," and I have puzzled much over the vexed questions of the fly as a lure. Standing quietly for hours at a time in all sorts of waters and weathers, I am convinced that the sight of the trout, at least that of *Salmo mykiss* or cut-throat trout, is not keen. It is my observation that trout, big and little, will when hungry rise at almost any small object that falls in the water, like leaves, feathers, twigs, sand, berries. In a big clear pool I have seen scores dart from every corner to rise at a falling leaf, and the one nearest and chancing to get it would apparently suck it in, then puff it out when he found out what it was. Often I have thrown in little pebbles the size of wheat and seen fish rise at them. It has come to be my theory that, just as a bird or other object coming between the human eye and the sun is seen in outline or in penumbra, so will a fish below the surface of the water see any falling object and be able to distinguish it only when in striking distance. The fact that fish in an unfished stream will strike a bare hook, as I have often known of their doing, seems to be an indication that the hungry fish does not see nor stop to see what falls within striking distance.

On the other hand, I can form no idea why a trout will prefer one lure to another. On one stream that I have fished more than any one else, and on which I do not know that any one except a few of my friends and myself have ever fished with a fly, I find that a professor as dropper and governor as tail fly on a No 6 hook are so sure as to be almost deadly. I have tried every fly from black gnat to white miller and red ibis with less and less success. I have tried grasshoppers, worms, periwinkles, meat and salmon eggs, which last are considered so deadly as to be unsportsmanlike, and yet at all seasons the professor and the governor will do better than any of them. There is not a natural fly on the stream at any season which in size, color or shape has the slightest resemblance to either governor or professor. Why should they be so deadly? X. Y. Z.

Cayuga Lake Netting.

A correspondent writing under date March 25 says: "I have reliable information that the door is wide open on Cayuga Lake and the Seneca River; both waters are full of nets; that wagon loads are taken daily of bass, pike and pickerel; that the local markets are glutted."

THE UPPER CLACKAMAS.

THE Clackamas River rises in the crest of the Cascade Range and empties into the Willamette River two miles below Willamette Falls and about ten miles above Portland. It is a wild mountain torrent, and one of the largest tributaries of the Willamette. At no season of the year have I been able to wade it at any point for thirty-five or forty miles. It is an ideal salmon stream, and the U. S. Fish Commission have two hatcheries on it, one about six and the other forty miles from its mouth. In the spring of the year and sometimes in the fall the salmon readily take the spoon or salmon roe, particularly at the dam about a mile from the mouth. My friend Sidney Smyth and myself in one half day's fishing two years ago caught twelve Chinook salmon with both spoon and bait below the dam. As regards whether the salmon in Oregon take the fly or not, I will say that as a rule they do not, but I know of two cases where a Chinook has taken the fly, one of which I witnessed myself. I have the honor of being the originator of the Mead fly, upon which they were taken. The trout fishing is very good in the upper river and its tributaries during the summer months. Salmon trout are caught at most all seasons of the year.

Shortly after my return from Roaring River, of which trip my friend S. H. Greene has so well written, while enjoying a much-needed rest, I was persuaded much against my will (?) to take to the mountains again by a friend who wished to get away from business cares and incidentally do some fishing. On a bright, sunny afternoon in September, R. R. Hoge, Dr. Bradbury and the writer left Portland for Oregon City by the electric car line, loaded down with rifles, fish rods and everything that goes to make life enjoyable in the mountains. After engaging a man for camp work, etc., we retired, but not to sleep, for anticipation kept us awake. We were up bright and early, and left Oregon City at 5 o'clock, and after a fourteen-mile drive we arrived at the end of the wagon road without any mishap other than the breaking of the rear axle, which our cook John quickly repaired with a small tree, which he lashed to the front axle and rested the rear upon it.

We found Mr. Willis and his son at home, and engaging the latter with two pack horses we proceeded down the trail as far as horses could go. We then shifted the packs to ourselves. I had a 40lb. pack, the Doctor the same. John carried the cooking utensils, etc., while to make it easy for our tenderfoot friend Hoge we gave him the rifles, fish rods, baskets, boots, etc. His load was the hardest of the lot to carry down that steep trail, but ignorance was bliss, etc. All went well until we came to a bad part of the trail known as "Jacob's Ladder," which is so steep that a rope has to be used in making the descent. The Doctor, John and myself made it all right, but Hoge was troubled with vertigo and could not make it; so I carried his outfit down, and then instructing the doctor and John to go on down to the cabin at the bottom of the cañon, about one-half mile below, with the outfit, I returned to Hoge and found him no better, so we decided to return to Willis's and spend the night, then get down by a lower and easier trail which reached the river a mile below the cabin.

We started early the next morning with young Willis to help us and reached the boat in good order. The river is very swift at this point, and we had to get up by means of a rope. The boat leaked badly and Hoge did most of the bailing, while I waded and scrambled over rocks, etc., and Willis acted as pilot. We reached the cabin about noon and found the Doctor putting things in order and John off up the trail after the last load. It began raining just as we arrived, and here let me say that it rained almost steadily for five days, leaving us one dry day in camp.

After a lunch and a rest I decided we needed fish. I borrowed a sweater of the Doctor, and putting on heavy hip boots I took my steel rod and spoon and started for a large, deep pool below camp. It was from 15 to 20ft. deep and full of dangerous swirls and eddies. I started wading out in the riffle above. More intent on fishing than as to my surroundings, I suddenly found myself swept off my feet. I hung on to the rod and regained my feet, only to lose them again. I then dropped everything and struck out for the opposite shore in order to avoid a large eddy, but the force of the current was such that I was carried right into it, and was drawn down till my feet struck bottom. I was doubled up so that I could not swim, so I tried to pull myself up the steep sides of the bottom by catching hold of the rocks, but could not get a hold. I finally straightened out enough to kick and swam out and to the surface, only to be taken under again by a smaller one further down. On coming to the surface again I struck a back current, which carried me in to shore, where I had just enough strength left to crawl out. I found my boots, which fitted tight around my thighs, were stripped down below my knees by the force of the first eddy. I walked back to camp feeling very weak, minus rod, reel and hat, nor have I seen them since. With my sweater and boots full of water, I seemed, in my weak condition, to weigh a ton, and I was very glad when the boys stripped and rubbed me down. I rolled up in blankets, slept for a while, and awoke all right.

The next day, in spite of the rain, we had some good fishing. The mountains on both sides of the river near our camp were very steep, those on the opposite side being almost perpendicular. John and I decided there were deer across from the camp, so on Saturday morning early we crossed the river, and finding a deer trail climbed up, and on reaching the last bench John went down and I up the river. I hunted till about 10 o'clock without seeing a deer, although I found plenty of fresh signs, and then started back. It took me two hours to find a way down, and when I did I dropped the last few feet, and found myself a half mile below camp. I was very tired when I reached camp, so I lit my pipe and sat down to wait for John. In about an hour he came along. He claimed he was not tired, but from the way his feet dragged behind him I have my doubts. Sunday we loafed around telling yarns, etc.

About midnight who should walk in on us but Sidney Smyth and Huntly, from Oregon City, and a gentleman whom Sidney introduced as his father. I did not know he had one living, but said nothing. They had come down that steep mountain trail after dark with nothing to guide them but a lantern. As the bunks were occupied, they turned in on the floor. The next morning I heard Huntly as well as Smyth address Mr. Smyth as "Pop," whereupon I became suspicious and finally discovered that Pop was none other than O. O. S. Immediately there was an uproar. From that time on Pop was more than welcome to my bunk, gun, rifle, fish rod and my time. We fished around all day and caught a nice mess of trout to take home.

Tuesday morning Pop, the Doctor, Huntly and Sidney took a portion of the outfit up the trail, and Hoge, John and myself took the balance down the river in the boat. I, as usual, took to the water, and was in it, six-shooter and all, before we reached the lower trail. We reached Willis's all right, and found the others there. After putting on dry clothes and eating a hearty lunch we took the team for Oregon City, where we arrived at dark, and after a dinner such as only campers can eat without ill effects we returned to Portland on the electric car.

We went into the mountains for rest and recreation. I, for one, never worked harder in my life; but we voted the trip a success, and vowed we would go again. "All's well that ends well."

J. ROBERTS MEAD.

PORTLAND, Oregon.

MEN I HAVE FISHED WITH.

XXXVII.—William Morton Locke.

ALL the old gunners and trap-shooters in western New York remember Mort Locke. No matter where or when the event was to be pulled off, nor what the demands of business might be, it was certain that Mort would turn up and enter in every shooting contest. When you know this and also that Mort was a poor man, dependent upon a small salary as station agent, telegraph operator, baggage master and sole representative of the New York Central R. R. at Honeoye Falls, N. Y., on that branch of the road which extends from Canandaigua to Batavia, runs two trains per day each way, and is called "the peanut road" by the trainmen, you get an idea of his love of field sports and of shooting. Then, if you can imagine a short, very stout, bald, blue-eyed man of thirty-five, you will know him as I first met him, thirty years ago, kind-hearted, genial and jolly. That's the best pen-picture I can draw of him.

Most of the summer had been spent in travel, seeking springs and brooks for the purpose of trout-breeding, and some man on the train said: "Get off at the next station and ask Mort Locke; he knows every spring and stream for twenty miles around." And it chanced that I bought a farm for its spring, and came into the friendship of as genial and warm-hearted a man as we seldom find. He had only one limit, and that, unfortunately, was his purse, for he had the tastes of a man of wealth; here the thought comes in that if the figures of the census gatherer should include this class there would be an appalling lot of impecunious fellows in it, and Mort Locke and I would be lost in the mass.

The Mendon Ponds, as they are called, are fine lakes in the township of that name some ten miles south of Rochester, and there we fished for pickerel. Putting our boat on a wagon, we usually made it a two days' trip, camping and hobbling the horses. Here I learned a new form of fishing. Mort's rig was a cane pole, selected as to proper stiffness, and to this a reel and guide rings were attached. He used a spoon and cast it from the bow of the boat, while I rowed slowly. Reeling up to within 1ft. of the spoon, he would send it whirling and splashing away near the weeds and then play the glittering lure as the fly-caster does. Usually the spoon fisher trolls from the stern, over water which has been disturbed by the boat, but Mort's method was not only new to me, but was very successful.

Like many other all-round sportsmen, fishing was with him a trifle slow compared to shooting, and Mort kept a couple of foxhounds, and induced me to buy two, so that we got up a fair cry, and many a winter day have I stood in the snow, almost frozen, and listened to the hounds until they were out of hearing, and the next day would be told: "If you'd stayed there half an hour longer you'd have got a fox, for the dogs brought him back right by your stand. I went over and saw the track after the hounds passed because I didn't hear you shoot."

"But the dogs went away off toward Hemlock Lake, and sometimes they've gone that way and haven't come back for three days. I wouldn't stay there and freeze my feet for all the foxes in Monroe county. I don't want a fox very bad, anyway; you may freeze your legs off for one, if you wish, but I won't." And so we would quarrel over my leaving the runway. As I remember it, one day out of three we would get a fox; one day out of ten we would get two, and once only we killed three. Some days it was warm work, running from hill to hill with a 10lb. 9-gauge muzzleloader, with its flask and pouch, only to find that the fox had passed and was liable to double back on the ridge just left. Feet did not freeze then.

Mort was very proud when he got a fox. If he only had a few rabbits he would strike straight for home, but if a fox was slung to his shoulder he would skirt the village and go up the main street. The day that we killed the three foxes we were off to the south, and his home was on that side of the village, but he wanted to go around and stop in the stores for provisions.

Mort was always moved by some immediate impulse, and never thought of a thing until after he had acted upon it, nor did he count the cost unless he was short of money; for he paid cash and never owed a man a cent. The following incident illustrates this point. In his office one winter morning he said: "Yesterday I saw this advertisement of a famous kennel of foxhounds in Virginia, and by this morning's mail I sent $25 for one. Oh, they're rattlers, swifter 'an chain lightning. I tell you there'll be fun when this Virginia foxhound gets here!"

"Mort," said I, "telegraph down to Virginia and countermand your order. The fox hunters there want swift dogs and ride after them, hoping to see them kill the fox and to be in at the death. That's no sport for us. We want slow dogs, which will bring the fox around where we can get a shot at it, just the same as in deer hounding, but you don't want a hound to kill a fox. Suppose he kills his game ten miles from you and you never know it? The conditions are different; Virginia gentlemen ride to the hounds on horses, and ladies join in the hunt, but they could never follow a fox over the hills and forests of Monroe county, and besides they think it is murder to shoot a fox."

"Is that so?"

"True as gospel, Mort. Sport is an ideal thing. We are not horsemen, and see no sport in having a hound kill a fox as a terrier kills a rat. I perfectly agree with you that when a fox dies I like to pull the trigger which causes his death, and I only look to the hound as a secondary cause, just as I do to the bird dog when a woodcock drops before my gun. That swift hound is just the kind of dog that is useful in Virginia, where fox hunters consider it a crime to shoot a fox; but he is of no use here. When the hounds run a fox past me, and I can pull a trigger on him and be the immediate cause of his death, then fox hunting takes rank with the hunting of the stag. A dog which should kill either fox or stag before it reached my gun would be killed by me in return."

But the hound came, and Mort was proud of his form and kept him close for some days in order that he might get acquainted in his new home. In half a dozen hunts we only had the pleasure of hearing the hounds start the fox and run him until their voices were lost in the distance; but no fox came around to our posts, and if the Virginia hound killed a fox we never knew it. We left him at home after that and relied on our old slow dogs.

If Mort Locke was not the most enthusiastic sportsman that I had met, he created the impression that he was, and his enthusiasm was contagious. He induced me to go after woodcock in a thick and heavy swamp on July 4 because the open season began on that day. I loved woodcock and woodcock shooting, but had never indulged in it until the coming of the brown October days brought relief from the burning sun of summer; for even in my young days some degree of personal comfort seemed necessary for enjoyment of any kind. Not that long and weary tramps were dreaded, nor cold feet were thought of, when prospective rabbits or foxes were in mind; but the blazing sun of July was more enjoyable on lake than in a thicket, and after presenting this view of the case to Mort and listening to his enthusiastic presentation of the case, we went.

The morning was clear and cool when Mort came to the house as an early breakfast was finished; a three-mile walk down the railroad track brought us to the swamp. Mort had borrowed a half-broken pointer from the village, and my mongrel setter was a dog which preferred chasing rabbits to working woodcock or snipe, and was handicapped by the weight of several ounces of bird-shot which had been inserted in those propelling muscles in his rear for his neglect to obey a recall from a rabbit chase, when his owner thought the marking down of one woodcock to be of more value than a ton of cottontails. And so we went forth after woodcock on the first day of the season about a quarter of a century ago.

While with Mort his enthusiasm compelled one to be alert for the promised sport; the day was young, and we were with nature when her vegetation was most luxuriant. We turned into the swamp, and put out the dogs. Half an hour seemed to afford sufficient sport for me as I made for the hill, wet through with perspiration, and face burning with spider webs. There is an exquisite torture in a spider web across a perspiring face that is not to be described, but half an hour in a dense thicket in July was all the sport I wanted. There was a broad oak at the foot of the hill, a cool spring just at its roots, and a light breeze invited repose. Mort's gun at intervals proved that his enthusiasm was not lessened by perspiration and burning spider webs, while the cool breeze fanned me to sleep.

Whether that sleep would have rivaled Rip Van Winkle's if the panting breath of a dog in my face, as a heated tongue licking my forehead brought consciousness, can never be known. Then Mort said: "Hello! where've you been? Didn't hear you shoot but once. How many birds did you get?"

"Been? Been right here having fun under this oak. I shot once and got one bird, thousands of mosquito bites, soaked with perspiration and face burned by spider webs. You've got eight birds, but I wouldn't spend an hour in that swamp to kill any amount of woodcock. I've had all the July shooting I want, and I doubt if the birds will keep until we get home."

They did keep, and we had them badly served by Dick Case, who was said to be good on oyster stews and other game. But when we brought in some October birds I did the cooking and served them *à la* Port Tyler, to the great delight of Mort and a few friends.

It is sad to think how much game is eaten and how small a portion of it is properly cooked. At a farmhouse in Iowa, years ago, a woman actually stuffed prairie chickens with bread, onions and other things seasoned with thyme, and said: "Ef I'd a knowed ye was a-comin' I'd a had a chicken killed, but the boys shot these an' I happened to have 'em in the house!" Some one has said that heaven sends us meats, while the monarch of the other place sends cooks.

Mort had not had chances for exercising epicurian tastes, but he had them, and once out of range of the cook in the rural restaurant, or family, he soon recognized that each game bird or animal had a distinct flavor which should be preserved. He readily learned this very important part of sportsmanship, for a man should know how his game should be served as well as shot. The day's sport is not complete with the shooting, but to invite friends to an evening dinner at which the hard-earned game is to be the central feature and then to have it villainously cooked is enough to ruffle the best of tempers. With this remark we will leave cookery, for although no one has arisen to publish a little book telling the loving and well-meaning housewife how to cook the game which her sportsman husband brings home, I can't do it. Pretending to know when it is done correctly does not include a knowledge of all details.

For eight years Mort was my constant companion on shooting and fishing trips. He would get a leave of absence for a week or two and we would fish in many of those small lakes of central New York or would shoot ducks on Cayuga Lake. These ducking trips must be postponed until another time, but the temptation to tell a cooking story on Mort is very strong. He knew, as all gunners know in a general way, the edible qualities of the different wild ducks, and he had thoroughly learned that a wild duck, which was anywhere near the first class, should have no "stuffing" of any kind, merely served *au naturel*. We gave a farmer some "sawbills" and sheldrakes, strong, fishy beasts, who said: "My wife kin bile them ducks with inyons an' stuff 'em with summer savory, 'n then roast 'em, an' you can't tell 'em fum teal nur wood ducks."

Mort drew a sigh and remarked: "Yes, and she could fill a teal or wood duck with onions and 'yarbs' until you couldn't tell it from a hell-diver or a loon!" His culinary education was complete.

Mort Locke was a born naturalist. The Indian mounds that he dug into filled his house with relics. He collected insects without any special knowledge of their places in zoölogy and he was always busy at something, and that something was always the acquisition of knowledge without a thought of pecuniary reward.

If William Morton Locke had, in his early life, been

thrown among men whose lives were devoted to research in the direction of animal life he would have made his mark. He was one of "those mute inglorious Miltons" who only lacked opportunity. He was dismissed several times because he did not attend to his railroad business, but was restored because he was so faithful when the geese were not flying over.

In 1876 I tried to get up an aquarium for the Centennial Exposition in Philadelphia, and as Mort had been discharged for locking up the railroad office for some days and going off after the spring flight of geese to the Mendon Ponds, I engaged him to help me. When I threw the thing up Mort tried it, but soon found that he was powerless and resigned. Drifting off to Michigan in 1878, he wrote me that while fishing near Fenton he caught a bigmouth black bass which had swallowed a full-grown sora rail and yet took his minnow.

That same year he was appointed to be the agent of the Louisville & Nashville R. R. at Marshall's Ferry, Ill., on the Wabash River, a point where grain and meats were transferred from the river to go South by rail. He wrote twice a week, and I published many of his letters at the time. His letters were filled with notes on the ducks, geese and turkeys, as well as extolling the catalpa worm as a bait for black bass and the "grindle" (*Amia calva*), also known as dogfish, bowfin, etc., as the best table fish in the river except the black bass. Without knowledge of the flavor of the water of the Wabash in White county, Ill., it is safe to say that if Mort's judgment on the native fish is correct they are a job lot, for the "grindle" is said by many to be uneatable, and, in my estimation, the black bass is a very poor table fish. Yet how can a fellow talk about gastronomy when a most lovely woman tells him that she "dearly loves cabbage!" It is a shock from which he never wholly recovers, and as he writes this there comes that old Latin phrase to the effect that tastes are not to be disputed. So we record that a man whom I had tried to train in epicurean ways calls the "grindle" a good fish, and a most charming woman, whom you would never suspect of having a gross taste, eats cabbage! Truly *de gustibus* may appear to be "disgustibus," but what are you going to do about it? Mort Locke was far from being a model business man, or a model in any way, but in "Measure for Measure" Mariana remarks:

"They say, best men are moulded out of faults."

When Mort went down on the Wabash he took his son Fred M. with him. As a schoolboy Fred would beg to go on our fox hunting trips, but would be threatened with punishment in varied forms if he stayed away from school. Once when there was doubt concerning which side of the Mendon Ponds the fox had gone Fred appeared and decided the case, Mort killed the fox and made no reference to the school, and the boy gave me a knowing wink. Yet that boy grew up to be an inventor of electrical appliances, and is now doing business at Victor, N. Y., while two very studious boys that I had under observation in the same little village went to the bad. If there is any moral in all this—and none was intended—it is that a boy is a quantity which may develop in a way that may surprise you. After he passes his twentieth year he is not apt to do this, but before that he is mighty "onsartin."

Marshall's Ferry, Ill., was one of those forlorn places where a man could live if he could get enough to eat, but Mort had to go to Mount Vernon, some sixty miles away, in Jefferson county, for those little things which make life endurable. Returning on a freight train, he got off at Upton to speak to the engineer while the engine was taking water, and in running to the caboose in the rear to jump on while the train was in motion he fell and his right knee was crushed under the wheels. It took time for surgeons to come from Hawthorn and Carmi; his strength was impaired by bleeding, and the shock of amputation was too great. Thus the kind and genial companion preceded us into the great unknown land. Fred Mather.

ATTEAN CAMPS.

Editor Forest and Stream:

An ancient heathen philosopher once said, in illustrating the duty of men to each other, that if one has a lighted lamp and another wishes to light his lamp at the flame, he ought to be allowed to do so, if for no other reason because he thereby attains something without taking anything from his fellow. As the sweet breath of this mild spring morning awakened pleasant memories of my last summer's outing, this saying occurred to me and has taken the modern form of a suggestion that if one knows of a place in the woods where the best of fishing and hunting can be had with accommodations such as can rarely be found where there is fishing and hunting, he ought to tell it to the readers of the Forest and Stream—it being understood, of course, that those who do not read this best of hunting and fishing journals do not deserve to be told. Indeed, I am indebted to the Forest and Stream for a knowledge of this place.

Casting about early last summer to find, if possible, a spot in Maine woods where my wife and I could enjoy the pleasures of camping out and life in the woods without its discomforts, I naturally turned to its advertising columns, and there among others I found a modest advertisement of "Attean Camps." Writing to the address, J. T. McLaughlin, Jackson, Me., I received an answer so definite, intelligent and generally satisfactory that we concluded to risk going from Pennsylvania to Maine on the chance of this being the place we were looking for.

So on a beautiful morning early in August, just before the sun rose, we left a train of the eastern branch of the Canadian Pacific Ry. at a rustic station on the banks of Attean Pond, where we were met by two guides, each with a canoe, ready to paddle us over about a half mile to the camps on Birch Island. Whoever has been in a canoe on a forest lake on a midsummer morning, when the first rays of the rising sun were beginning to touch with crimson the fleecy clouds in the blue sky above, can imagine how we enjoyed this passage.

Arriving at the island, we were shown into one of a number of log cabins standing on the brow of the ascent from the shore. It had one room, nicely furnished, with comfortable beds, and everything neat and clean. In due time we were conducted to one of the other cabins, which proved to be the dining room, where an excellent breakfast of trout and the best of coffee, among other things, awaited us. This was our introduction to Attean Camps. We were much surprised to find, as part of the arrangements for the entertainment of guests, a good piano and several shelves filled with books, two or three of which were written by the father of the mistress of the island, who herself is an educated lady who sings and plays well, and who is ever ready in the evening to accompany any of the ladies who wish to sing.

But your readers will want to know about the fishing and hunting. Both are excellent. Unfortunately my vacation came too late for the spring fishing, which of course is the best, and too early for the hunting season. But the fishing was good during the summer, and trout in quantities to satisfy any reasonable votary of the rod could be caught at any time. One of the guests, a gentleman from Boston, took in little more than an hour fourteen trout, whose combined weight was over 23lbs., and during all our stay the table was supplied with them.

The deer hunting is also of the best in its season. As I have said, I was compelled to leave before this began. But I had ample evidence that deer are very plentiful. It was a common occurrence to see them on the shore of the pond opposite the camps, and it was one of the diversions of the ladies to watch and admire their graceful movements. The numerous stretches of sandy beach were trodden over in the morning as if a flock of sheep had been there during the night. There can be no doubt that any hunter could easily get his quota of deer in a short time.

Although we missed the best of the fishing and the hunting, we enjoyed ourselves thoroughly and remained much longer than we intended, and were sorry to leave. We enjoyed the rest and quiet, the fresh and bracing air, the delightful canoeing trips on the ponds and streams, and the sound, refreshing sleep which comes after a day spent in the forest or on the lakes. We were living in the woods with the comforts of home. This is what makes Attean Camps especially eligible for sportsmen who wish to take their wives and daughters with them.

Perhaps I ought to add that Attean Pond is about five miles long and from one to three miles wide, contains a number of islands, and is one of several ponds into and out of which Moose River flows. This stream rises among the mountains, and by a devious course through the ponds referred to makes its way finally into Moosehead Lake nearly opposite Mt. Kineo and the hotel of that name. This affords opportunity for a great variety of excursions by canoe. Good guides can always be had at Attean Camps, and a large extent of the river is within the boundaries of the reserve belonging to these camps. A comfortable log cabin, furnished and provisioned, and situated on a bluff overlooking the river, in a grove of tall Norway pines, about fifteen miles up the river from the camps, is a pleasant place, where guests may stay over night on an excursion or where they may spend several days, if so minded, near good fishing.

I believe that whoever visits Attean Camps will thank me for making the place known to them. J. W. S.

KLAMATH LAKE.

Jackson County, Oregon.—*Editor Forest and Stream:* Perhaps a description of this wonderfully beautiful lake and its surroundings will not be unappreciated by the disciples of the gun and rod. By reference to a map of Oregon you will see that the lake lies on the southern border and a little to the west of the center of the great State of Oregon and at the eastern base of the Cascade range of mountains. It may be said to be the great source of the Klamath River, from which lake it flows and tumbles south and west, cutting the Cascade range at right angles some twenty miles below the outlet of the lake. In its tortuous and precipitous course of some 300 miles it falls about 3,000ft., emptying into the Pacific Ocean at Crescent City, nearly on the boundary line between Oregon and California. Speaking advisedly, the river is literally packed with trout from its mouth to its fountain head. The beautiful lake is thirty-five miles long by about eighteen broad. At places the depth is immense; the shores are very irregular, adding greatly to its beauty, while at intervals of several miles (and more particularly on the west side—the greatest length of this lake is north and south) estuaries or tongues, from 80 to 100ft. wide and from 10 to 20ft. deep, reach back from the shore inland from one-half to two miles, and all the way of a uniform width and depth. Always at the heads of these are mammoth boiling springs of the purest water, and so cold as to be but 8° above freezing, nor do they vary in their temperature 1° summer or winter. As a result these estuaries never freeze over even in the coldest weather; so that during the winter months, when the lake puts on her icy robes, the estuaries are actually packed with ducks of many kinds, which abound here at all seasons of the year and from which you can take your pick as you need them. This is not hunting—all you have to do is to shoot them. The waters of this lake abound with lake trout weighing from 4lbs. to 16lbs. These fish can be taken with trolling lines as fast as the most sanguine sportsman could desire. I know of no better fishing from ocean to ocean, and experience gives my judgment weight.

Mallard ducks hatch their young in the marshes around this lake, and to estimate their number would be as unreasonable as to estimate the number of mosquitoes to the acre in the swamp bogs of New England. From Aug. 1 to cold weather the number that invites the sportsman is incalculable.

If at any time you get tired of this small game and have the nerve for larger, you can go back from the lake, west, up and up for twenty miles, to where winter holds uninterrupted sway eleven months of the year, and the twelfth is not without its drifts of snow, ever and ever shining in dazzling whiteness, as the sun looks upon them from his august throne out of an almost cloudless sky, up to where the ice and snow clasp forever in their cold embrace the summit of Mount Pit. But take care how you go; leave your shotgun by the lake with your fishing tackle, and take your rifle (.38 to .45 will do). Now, with nerve and some experience, you can bag most any game indigenous to this section, from a wildcat to a cinnamon bear; but deer and bears are all you need to hunt. Nor is it always desirable or necessary to hunt the bear; he will probably find you; and if not, and you are an amateur, it is just as well. But it is necessary that you have a good rifle and know how to use it upon the shortest possible notice.

The west side of the lake is the sportsmen's and tourists' "retreat." This is now included in the Crater Lake Forest Reserve. There are but a few settlers and far between. They took their claims before this was set apart as a forest reserve, and consequently hold their rights amid this glorious solitude

Although this lake, with its marvelous sporting capacities and health inviting atmosphere, has been known by a few for many years, it has only within the last two or three years come to the knowledge and notice of the outside world, and as yet is as unknown to the people of Oregon, except a few, as are the pampas of Russia or the desert of Sahara. But this is past. Last season it was visited for the first time by many tourists and sportsmen. They will come again, bringing others with them, and in a few years we predict this will be the watering place of this coast. A practical route to the lake has been opened from Ashland, a distance of about fifty miles, over mountains, through primeval forest, by lakes and streams, as grand as the Great Architect of nature could construct, and beholding it for the first time you invariably exclaim: "The one-half was never told."

Ira Wakefield.

Tarpon on the Florida East Coast.

I think that it is now a fairly established fact that there is excellent tarpon fishing on the East Coast of Florida; and this has been proved in the last week to my entire satisfaction.

It has for the last few years been said that they would not bite on the East Coast, and that unless shrimp could be obtained there would be no fish caught.

The following is the list of the seven days' fishing that I know of having been done at Miami, Florida:

1. One boat, five hours, two strikes.—One fish, caught by Mr. Cauldwell in two hours and forty minutes, using a 15-thread line; fish was a female and weighed 141lbs.
2. One boat, six hours, seven strikes.—No fish.
3. One boat, three hours, one strike.—No fish.
4. One boat, four hours, seven strikes.—No fish.
5. One boat, six hours, four strikes.—No fish; one on for fifteen minutes.
6. One boat, six hours, three strikes.—One fish on ten minutes.
7. Two boats, five hours, three strikes.—Two fish caught, one of them a 90-pounder, by Mr. T. A. Havemeyer, of New York, in two hours and five minutes. This was a very game fish and fought from the word go. The other was a female of 176lbs. that I killed in twenty-five minutes. He was a very "logy" fellow and only made six leaps. I had a great piece of luck in getting this fish, as he made a run the first thing from my boat to the sloop, which I had sailed up in, and got foul of the anchor rope. He had enough play for the line to slip a little, and finding that I could not get clear I reeled off about 50yds. of line from my second rod and made a "flying switch," and transferred to the other rod. Tugging and straining at the line when caught, with only a little give, had so tired him out that I brought him to the boat in less than five minutes. I repeated this performance four times, as I had not a gaff, and then brought him up right to the boat on his side, when my boatman (Sam Roberts, from the West Coast) drove an old harpoon that happened to be in the boat into him and we pulled him ashore. He hardly struggled when the harpoon hit him.

Roberts, who has been tarpon fishing on the East Coast for the past five years, says that there is much better fishing here than on the West Coast. Both he and I are looking for the man that stole our gaff while we were out of the boat, and if we find him will "gaff" him. I inclose you a scale and a photo of the fish. Edward A. Watson.

Virginia.

The Massachusetts Association.

Boston, Mass., March 25.—*Editor Forest and Stream:* Secretary Kimball, of the Massachusetts Fish and Game Protective Association, has issued a neat little booklet giving a list of the officers, committees, and active, honorary and life members of the Association, by which it appears that there are upwards of 250 names upon the roll. Of course, in all associations like this there are many who lose their interest after a few years and allow themselves to fall in arrears in regard to dues; these have been dropped, and it may safely be said that the list now represents only those who are devoted to the objects of the Association, and propose to do their share toward carrying on the work it has so successfully prosecuted for twenty-five years.

The committees for the current year, as appointed by President Rockwell, are as follows: On legislation: President Rockwell, Benj. C. Clark, Dr. Heber Bishop, Edward J. Brown, Dr. John T. Stetson, Loring Crocker, Robert S. Gray, George W. Wiggin, J. Russell Reed; on enforcement of laws relating to fish: William B. Smart, Charles G. Gibson, Rollin Jones, Edward E. Small; on enforcement of laws relating to game: Arthur W. Robinson, Loring Crocker, Charles A. Allen, Warren Hapgood; on publication: Secretary H. H. Kimball, Dr. W. G. Kendall, Geo. O. Sears, Dr. E. W. Branigan; on finance: Charles Stewart, Sidney Chase, W. C. Prescott, Charles G. Gibson; on entertainments and meetings: C. J. H. Woodbury, Geo. W. Wiggin, William Almy, Thomas H. Hall, William B. Smart, Dr. Heber Bishop; counsel: George W. Wiggin, J. Russell Reed.

In past years considerable good work has been done by the committees on the enforcement of the fish and game laws in consequence of information furnished those committees by parties cognizant of the violations of those laws, and they would be glad to be informed in the future, as in the past, of such violations. To be effective these complaints should be accompanied by names of parties willing to give evidence against violators of the law; dates, names and facts are what the committees desire, and when these are furnished they will be used in the manner best calculated to bring substantia results. The address of Mr. Robinson, chairman of the game law committee, is No. 4 Post Office square. My address is No. 11 Allston street, Dorchester. William B. Smart.

Game and Fish on the Biltmore Estate.

Asheville, N. C., March 27.—Thirty thousand rainbow trout fry were placed this week in the streams which run through the Biltmore Estate, George W. Vanderbilt's 100,000 acre tract, which lies to the southward of this city. They were brought from the Virginia State hatcheries at Wytheville, about 80 per cent. surviving the hardships of the journey. Several fine trout streams have their sources on or near Mount Pisgah, which has an elevation of nearly 6,000ft. above sea level, and is a part of Mr. Vanderbilt's extensive holdings, though not as yet connected with the main tract on which the manor stands. Bears, deer, raccoons and wildcats are said to infest these lofty solitudes, and turkeys, grouse, quail, rabbits and squirrels are abundant. Efforts are being made to raise a few broods of English pheasants, which will be turned loose to multiply and replenish the earth, or at least that not inconsiderable portion of it owned or controlled by the young millionaire, whose friends are to be envied for the sporting privileges which the future has in store for them. J. L. K.

The Forest and Stream is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

The Black Bass Season in New York.

JACOBSTAFF sends us the following note written by his friend W. L. Stone, of Mt. Vernon, and printed in the *Sun*, relative to the proposed change of the black bass close season to run from Oct. 15 to June 30.

"Now the fact is that in Brant Lake, Warren county, New York—and I myself stocked that lake in 1875 with bass sent me by Seth Green—the bass did not spawn until July. Therefore this proposed enactment, if passed, will, so far as Brant Lake is concerned, be entirely nugatory. Indeed, I know of two sportsmen (?) from New York city who, knowing of this fact, come up regularly each season in July and catch large quantities of that fish (often hundreds of pounds) directly from off the spawning beds; and for this reason, viz.: It may not be generally known that the mother bass (or any other fish for that matter), while on their spawning beds and engaged in protecting their young fry, in their search after food eagerly seize on any bait that appears. Hence the anxiety of the mother fish to procure all the food possible for their young just hatched out, rendering the bass (generally a very shy fish) utterly reckless in procuring their food. I would suggest, therefore, that the closed season be from Oct. 1 to Aug. 1.

"Again there is another point which this game commission does not apparently take any account of, viz.: that they cannot make general regulations to suit each particular case. For instance, near the confluence of the Boreas River with the Hudson there are two large lakes—"ponds" the hunters call them—within one-quarter of a mile from each other, and known respectively as the "Upper" and "Lower" Beaver and filled with trout. Now in the "Lower Beaver" the trout spawn in September, while in the "Upper Beaver" the latter part of October. It is thus seen how futile it is for the commission to make a universal law on this subject which shall cover each case.

"The remedy for this, it seems to me, is for the commission carefully to investigate these facts and make a law which shall cover all cases, even if it does curtail the "open season," for it will at once be seen that in the case of these two takes a "pot fisherman" may obey the law in regard to one pond, while he exhausts a month later the other pond, and all within the law."

Long-Distance Casting.

ESCANABA, Mich., March 22.—*Editor Forest and Stream:* Some twelve or fifteen years since some of the young men of New York complained bitterly because Seth Green and Reuben Wood won all the prizes at fly-casting. I joked them in FOREST AND STREAM and called them boys, and advised them to improve their tackle and practice, as I saw no reason why one should not reach from 90 to 100ft. Soon after that Dr. Henshall gave me a big shot and warned people to look out for anyone who made such a statement—"as it could not be done." The next year Mr. Prichard cast over 90ft.; since over 100ft. has been done. Thos. Mansfield's cast I do not like; the papers say he stood on the dock, but fail to say how high above the water. The caster should be the same as if in a boat. A. F. Y.

The Nepigon Trout Record.

Editor Forest and Stream:

In a recent issue of FOREST AND STREAM on the large fish caught in the Nepigon River was a 16lb. trout. This should read "lake trout," as the largest speckled trout caught in the Nepigon (that is on record) weighed 8lbs. 2oz., and was caught with a fly by a gentleman from Philadelphia. I reported this to FOREST AND STREAM at the time. If a 16lb. speckled trout was ever caught in the Nepigon it is unknown to anyone around that place. JOHN E. NEWSOME.

[The 16lb. brook trout of the Nepigon was caught, if at all, more than twenty years ago by Dr. Hoy. This fish has so long had a place in brook trout records or legends that we are not disposed to dismiss it summarily upon such testimony as given by Mr. Newsome.]

Fishing Tackle.

IT is a pleasure to record the fact that some of our leading manufacturing firms deserve all of the good fortune that may come to them. Owing to their straightforward dealings, Messrs. Abbey & Imbrie, 18 Vesey street, New York, are a notable example of the above, as they have been in business—as they put it—"seventy-seven honest years," and distinctly owe their success to the quality and style of their manufactures and honest method of doing business. We are just in receipt of their handsome illustrated catalogue for the season of 1897, which they will mail free on request to anyone who is interested in fishing tackle. Upon looking over the catalogue it will be noted that they have a very large number of specialties peculiar to themselves, also a number of novelties which they are putting on the market for the first time this season. Everyone knows that the trade mark of Abbey & Imorie means sterling quality. Write to them for information in relation to fishing tackle or for advice as to "what will catch fish anywhere they are to be found," mentioning FOREST AND STREAM.—*Adv.*

Fishing Tackle and Sportsmen's Goods.

WE have received the following card, which speaks for itself: W. R. Scott (for many years in charge of the fishing tackle department of Dame, Stoddard & Kendall, of Boston) will open his new store at No. 26 Bromfield street (up one flight) on or about April 6, with a finely selected stock of goods for the angler and sportsman. New goods, low prices and close personal attention given to orders. Special care and promptness in response to mail orders. Tackle for salmon, trout, bass and salt-water fishing, and for trolling in the lakes. Flies and leaders of every pattern and style for Maine and Canadian fishing.

Information furnished regarding Maine, New Hampshire and Canadian fishing and hunting resorts, and names and addresses of good guides given on application.—*Adv.*

Salmon Fishing for Sale.

FREEHOLD, on the best fishing waters of the southwest Miramichi River (Burnt Hill). For terms and particulars apply to Thomas J. Conroy, 28 John street, New York city.—*Adv.*

"Angling Talks."

WE have a very few copies of George Dawson's "Angling Talks," a series of chapters of entertaining chat about men, fishermen, fish, fishing and fishing places. Cloth, 50 cents. Forest and Stream Publishing Co.

A NEW YORK CITY reader who sends his paper to a friend in the country received from him a letter the other day which ran: "Your papers arrive in due season, and thank you very much for them. The FOREST AND STREAM is my favorite paper. It does a fellow good to draw his chair close by the fire on a cold winter's night and read a good hunting story like those found in FOREST AND STREAM. It sends the blood coursing through your veins, and makes you feel like shouldering your gun and going out the very next day."

"DAT LI'LE ALABAMA COON."

"Away down South in the land o' cotton,
'Simmon seed and a sandy bottom,
Look away, look away, look away
To Dixie Land!"

"Yo' all is all too pow'ful tired ter go coon huntin' ternight, ain't yer, gen'men?"

The group of huntsmen who were comfortably settled around the log-fire of their heaven upon earth, the Wilderness Club, looked up at the stalwart form of the negro who emerged from the unknown regions of the darkness without and addressed them.

"Whut's put coon huntin' in your head, Pete?" the Colonel asked languidly. The feast which they had had of savory mallards and teal done to a turn, and of squirrels barbecued

"THE FUR BEGINS TO FLY."

as only the club cook could do them, together with the remembrance of the strings of game, including wild turkeys and geese, hanging in the cold outside air, did not predispose the party to violent exertion even if they had not spent the day on the lake or in wading about its marshy borders waist deep in its proverbial tules and lilypads

Pete's anxious eyes roved from one face to another, taking in with a sigh their universal expression of post prandial satisfaction, as, laying down his axe and sack, he answered:

"Nuthin' 't all, boss, 'cep'in' ez I wus comin' th'ough de woods dat yaller dorg uv mine done treed er coon, an' I says ter myse'f, 'Some dem fine gen'men down ter de club 'll show wanter see er coon an' dorg fight! Why, gen'men, they ain't nary dorg widin dis county ez kin hol' er light ter my yaller dorg—jes' tother day he —"

"See any possums, Pete?" There were too many adventures and stories to be told to allow Pete's verbosity.

"Possums, did I heah yer say? Why, Lord! dey's thicker'n blackberries in fly time! An' dey's done eat dem 'simmons an' grapes 'tel dey's so fat dey faihly makes yo' mouf water!" His eyes shone at the mere recollection.

The Colonel turned to the Commander: "Pete reminds me of that old joke of Bob's; evah heah him tell it, sir? Whut, never heard Bob—but of cou'se you couldn't when you 'e evahlastin'ly wanderin' 'round on ther watah! Nobody in this wo'l' can tell er joke like Bob, but he says 'that

HOMEWARD BOUND.

one time up in his mountains they wus havin' er quiltin'—kinder ole-fashioned pahty, yo' know—an' while the young folks wus courtin' an' holdin' hands in ther dark cornders thar wus er warm an' animated discussion among ther ole ladies as ter whut wus ther mos' delightful produc' uv ther gard'en. One ole lady said thet so 'fur' as she wus 'consarned' she preferred ther 'perturnip;' another preferred ther 'pertater;' another ther 'cowcumber,' and still another voted 'ingern' king But suddenly a wise ole dame raised her spec's an' settled the question by observing: 'Ah, ladies, you may talk about yer perturnips, an' yer pertaters, an' yer passnips, an' other gyardin-sass, but the sweetest wegetable thet evah melted on the e ole gums o' m ne is ther possum!"

When the laughter which always follows Bob's jokes had abated somewhat, the Commander asked: "And who is Bob?"

"Well," drawled the Colonel, "right at this present settin' of ther cou't he ain't nobody in partic'lar, but in Ma'ch he'll be, for the third time, Guv'ner of the State of Tennessee."

"You don't say!" and this time the laugh was on the Commander.

At that the man who had hunted with Bogardus, who had shot deer in the Adirondacks, buffalo on the plains, moose in the great Northwest of Canada, and could show the hides and horns of strange creatures from across the seas, captured in their native haunts, jumped up and cracked his heels together: "I don't know what Bogardus would say to such hunting," he cried, "but I'll find out if the old lady was right. Will any of you gentlemen join me?"

Despite the fact that they had been awake "sence long 'fo'e day," as their negro cook expressed it, and, except for the time spent in ravishing the goodly table spread for them, had been steadily hunting all the time, three of the men responded, and with the joyous shouts of schoolboys they followed Pete out into the night.

Did you ever step from an overheated room into the crisp, frosty night air, when the firmament above was spangled o'er with diamond dust wrought into a myriad of patterns, which were accentuated here and there with solitaires? To suddenly be in the wilderness, far from the madding crowd, where e'en the organ-throated voice of Nature was hushed and still under the glistening coverlet of rime, when the crispness made the twigs and dead leaves crackling under foot the only sound that broke the silence of the night?

Nay, not the only sound, for as you stealthily pursue your way the barking of the dogs comes quick and sharp, the flaming torch comes to a standstill, the shadowy figures gesticulate wildly in the weird half-light as the negro guide strips off his coat, and tying the sleeves around the boll of a tree rushes forward in the footsteps of the frantically barking dogs.

A "Hie there! What are you up to?" elicits the response from Pete: "Hit's al'right, boss; they's er possum up de 'simmon tree an' er coon down in de holler!"

Madly following, we arrive in time to see two glistening balls of fire gleaming at us in the darkness, and then, as the torch is carried nearer, we witness the gamest fight imaginable.

Surrounded by a ring of enemies, with his back against a tree and no hope of escape, the coon stands his ground courageously, ready to fight to the death.

One moment only he stands there alone, facing his deadly foes; the next he is the center of a scrambling, and scratching, and snarling, a biting and barking and yelping mass, exhibiting a boxing match worthy of a belt winner, and receiving yells of encouragement from the men as the fur begins to fly and the combatants close in.

"Sic him, Tige!"

"Whut's de mattah wid yo', sir?"

"Name o' goodness, look at dat coon!"

"Whut's come over dat yaller dorg?"

Followed by a shout of joy as the "yaller dorg," thus encouraged, fiercely seizes the coon by the chest and crushes him until he ceases to struggle.

"Whut I done tole yer?" is all that Pete can say, as he pats the head of his "yaller" mongrel amid the plaudits of the hunters, and then dropping the coon into the sack leads the way back to the treed possum.

To get the branch of a tree between you and the new-risen moon, to decipher the silhouette of what appears to the untrained eye a mere bunch of leaves, to insist that you recognize the outlines of another possum on what the guide assures you is a bunch of mistletoe or a squirrel's nest; to see the coat sleeves, which have kept the possum prisoner during your absence, untied, and the persimmon tree vigorously shaken by the negro until the mass of leaves, or fur, or what not, falls to the ground and lies there passive, while the dogs snarl and bite at it; to see the negro pick it up and wind its tail around his axe helve, which he swings over his shoulder as he explains: "No, sah, 'tain't no danger uv dis heah varmint er droppin' off, he'd hang on all day ef I was ter tote him 'roun'; he ain't dead, sah. Ain't yer never heerd uv possumin?"—is but the work of a short time, and then the forest resounds and lake re-echoes the shouts of the returning hunters proclaiming their success to the friends who await them at the fireside.

"DE RACCOON HAB A RINGY TAIL."

Bob-tailed Bulger and Tige, which from a long ancestry of abbreviated curs were born curtailed, were the canine heroes in the strife. After bagging old Zip coon and hooking the possum's tail around the axe helve, and turning their inward eyes toward sweet 'taters and possum soup, with Dinah and the pickaninnies, Gabe and Pete brushed their cotton-picking chicken-stealers across their banjos, and while Sam patted with hand and foot they chanted and intoned with Afric melody, in the heart of that cane brake "mash:"

"De raccoon hab a ringy tail,
De possum's tail am bare,
De ole har's got no tail at all,
And no tail's got de bear.
Oh, dem golden slippers,
We's climbin' todes de stars."

ELLA M. WHEATLEY.

MEMPHIS, Tenn.

A Dog Worth Two Field Hands.

BOB PAYNE mourns the loss of his wonderful dog, whose biography we gave in the *Enterprise* last year, and whose forte was worming tobacco. This dog, it is claimed, actually repaired daily to the tobacco patch and carefully sought for and destroyed the worms which prey on the plant. He is now at rest from his labors, and Mr. Payne says he will have to hire two hands to take his place in the tobacco field.—*Lebanon (Ky.) Enterprise.*

THE CALIFORNIA CLUBS' TEMPEST.

THE storm center of the dog world seems to be permanently fixed in California, with the point of greatest disturbance at San Francisco. Much of it seems to be the result of personal spite and disappointed ambition on the part of one man or more, much to the discomfort of many others.

The acute stage of conflict and acrimonious personality was reached when recently the Pacific Kennel Club ceased to exist, and made the Olympic Gun Club legatee of its good will and some of its belongings. The Olympic Gun Club, a gun club pure and simple, with a doggy afterthought as legatee, and which as a club it recently repudiated, applied for membership in the A. K. C., trusting that an informal pretense to an interest in dogs and bench shows would make it eligible to membership. The constitution which the Olympic Club submitted with its application for membership to the A. K. C. was neither in letter nor spirit what was required by the A. K. C.; and said application, as it then stood, could not have been accepted by the A. K. C. under any circumstances.

It is a waste of effort to dwell on what the club intended to do later in the way of amending its constitution. The A. K. C. could only officially recognize what it really submitted.

Coincident with the application of the Olympic Gun Club came an application from the San Francisco Kennel Club, a new club occupying the same field as had the defunct Pacific Kennel Club, eligible in every way and with a constitution which fully filled all the exactions imposed by the A. K. C. It further had the favorable recommendation of the Pacific advisory board What was the result? There could be but one, and the San Francisco Kennel Club's application was accepted.

The membership of the new club is strong both in numbers and the standing of its personnel. It is folly for a handful of disappointed seekers of power to denounce the new club and the Pacific advisory board and the American Kennel Club, and all else which interposes between their personal ambitions or likings and the canine world at large. If they are right, it is extraordinary what a number of clubs and what a number of good men have gone wrong in a matter in which most of them are entirely disinterested; and on the other hand, if they are right it is not at all remarkable that they should be so when we consider their long schooling, numbers, high standing and capability. It would be expecting too much of these men that they would interest themselves personally in the personal prejudices or enmities of factions, and officially such matters are irrelevant. It is possible that for the personal factional bitterness they care nothing.

In the *Breeder and Sportsman* of March 13 Mr. Crowell presents a garbled report of the last A. K. C. meeting, and draws some false and malicious inferences from it. He denounces Mr. A. P. Vredenburgh in particular as being the prime cause of the rejection of the Olympic Gun Club's application. He seems to think such rejection was an infamy. He is even more severe in his denunciation of the Pacific Advisory Board. He gives a list in part of the membership of the late Pacific Club—though the club is now out of existence and therefore immaterial to the matter—and also a list of the members of the Olympic Gun Club, and eulogizes them. Of the A. K. C. he says: "Regarding the A. K. C. end of the question, our readers should remember that the delegates took their cue from the secretary, Mr. A. P. Vredenburgh. This infamous action must be laid at his own door, as he, and possibly the membership committee, are the only ones fully acquainted with both sides of the question. To this man Vredenburgh may be laid the entire success of the scheme which was so cleverly laid at this end of the line. Afraid of the lash of the "mischief maker" and only too glad to wreck his vengeance against the P. K. C. for a fancied wrong, he not only presented the report of the advisory board in as favorable a light as possible, but hoodwinked the membership committee and deliberately withheld the correspondence of the Olympics. M. C. Allen, secretary of the O. G. C., wrote to Vredenburgh (in the same inclosure that contained the constitution of the club), that holding a bench show was not the object of the club when it was first organized, but that circumstances had arisen which had caused the members, as lovers of the dog, to desire to incorporate bench shows with their other objects, and that the board of directors would add any clause suggested by the A. K. C. or its secretary.

Much in the foregoing is absolutely false. Mr. Crowell admits that the constitution of the Olympic Club was lacking in the very first essential of what the club should be as a member of the A. K. C. If the members loved the dog so dearly, they surely could have said so in their constitution. They knew all the A. K. C. requirements in this respect when they made their application, and truly it seems farfetched to blame the A. K. C. for their own negligence. Why should the Olympic Gun Club expect more of the A. K. C. than any other club? Because of its title? Mr. Vredenburgh presented the matter of the Olympic Kennel Club's application in precisely the same manner that he presented other matters of business for the consideration of the A. K. C. He gave his best thought to it. There was no "infamy" whatever in an officer of the club performing his duty, and it is an unpardonable libel on the officers and delegates of the A. K. C. to assert that any infamous action would receive their sanction or countenance. In asking for the respect and consideration he claims for the body of men he assumes to represent, he should not forget that respect is also due to others. A mere reading of the list of officers and delegates present at the last A. K. C. meeting is all that is necessary to refute the malicious misstatement uttered by the *Breeder and Sportsman*.

The reason which prevented at the A. K. C. meeting a reading of the full correspondence of the S. F. K. C. and O. G. C. matter was that the A. K. C. had a large amount of business to consider, and had a long session. The matter had been thoroughly considered by the membership committee. In that way it had full official consideration. In view that the Olympic Gun Club was not eligible, that alone adversely settled its application, and was so accepted by its representative, Mr. Bargate, and all its correspondence would not change that fact. There was nothing which required that the correspondence be read at that time. If it was couched in the delicate language and picturesque forcefulness employed by Mr. Crowell, it might have been interesting as an unique contribution of mental lawlessness, but nothing more.

The next stage of official importance was the action of the St. Bernard Club, of California, which resolved that it would not support the San Francisco Kennel Club's show. In plain words, the latter had declared a boycott on the new club. The St. Bernard Club, as a club, had no standing in the issue between the Olympic and San Francisco clubs. Its gratuitous action therefore was entirely arbitrary, and could proceed only from the personal ill-feeling of a part of its members. Its unfriendly action was deplorably ill advised, placing it in open and declared hostility to a fellow member with which, as a club, it had no grievance, and in rebellion to the ruling of the central body, the A. K. C. If its insubordination is permitted, there is an open road to swift disorganization of the whole A. K. C. structure. If the St. B. C. of C. had a grievance, the A. K. C. has a regular procedure for considering and passing upon it and all other club grievances. As a club member, it had pledged itself to the support of the A. K. C. and an observance of its laws. To take the law into its own hands and oppose the A. K. C., and declare war on a fellow member in good standing, is contempt and rebellion and injustice of the most flagrant kind. The hand of the A. K. C. should be laid upon the St. B. C. of C. with a firmness that will readjust it on right lines of loyalty or out of the A. K. C entirely. It is contrary to all the ethics that the tail should wag the dog.

POINTS AND FLUSHES.

Mr. Thomas Johnson, Winnipeg, has published in the *Daily Nor'wester* a challenge for a match race between one of his pointers and anything an unknown, who conceals his identity under a *nom de plume*, can produce. For directness and serious purpose his challenge is in sharp contrast to the columns of serials, stuffed with advertising and inflicted on the American public up to two years ago After recounting some particulars, Mr. Johnson states his challenge as follows: "I would suggest that Anti-Humbug procure a pointer dog from any part of the world that can beat a dog in a field trial now in my kennel, bred by myself, for any part of $1,000. As an evidence of good faith I have placed in the hands of Mr. John Baird $100 to bind the match, and I will give another $100 to the Winnipeg General Hospital if I do not prove your correspondent as lacking in nerve as he is in veracity."

Mr. William Brailsford, under date of March 15, in a letter deploring the sad loss by death of the late owner of the Ightfield Kennels, informs us that it has been decided that the whole Ightfield Kennel of setters and pointers shall be sold at Aldridge's in June or July. In consequence of his employer's death, none of the Ightfield dogs will compete in the coming spring trials, but he further adds that the latter have numerous entries, and there will doubtless be a strong competition.

Mr. R. B. F. Randolph, who is in the Department of Bacteriology, Hoagland Laboratory, Brooklyn, N. Y., has been experimenting with the bacillus of distemper with a view to discovering an effective remedy for the disease. The following paragraph, taken from his recent letter to us, will explain his needs in the matter. Any one who can furnish the needed subject will do a good work in promoting investigation by a thoroughly qualified and competent gentleman, and contribute toward the discovery of specific knowledge concerning the most destructive disease which afflicts the dog, and toward a remedy for it. Of course it is desirable that the subject be as near Brooklyn as possible. Mr. Randolph writes: "I am very anxious to get a dog with distemper, and would like most of all to have access to the body of one that has died of it, as soon after death as possible. It will not be necessary to take the body to the Laboratory, as if I can learn the whereabouts of the animal I will go myself and make the necessary cultures. It is important that these be made as soon after death as possible, for if decomposition sets in other bacteria will invade the tissues and complicate or render futile my search for the bacillus."

The Alameda County Sportsmen's Association, Oakland, Cal., recently disbanded and a new club was organized under the title of the Oakland Kennel Club. The reasons for this action were local, and the new club is largely the old club under a new name.

Mr. J. J. Lynn, Port Huron, Mich., secretary of the International Fox Terrier Club, writes us that the first show of the club will be held at Port Huron, Mich., April 21, this year.

Mr. Belmont is having presumably a pleasant time in the West, with just enough of adventure to put a mild spicing to the pleasure. The following, from the New York *Times*, recounts the delights of a mountain ride which he enjoyed:

"DENVER, Col., March 27.—The Denver and Rio Grande express from the Pacific coast pulled in nearly two hours late last night, the delay being due to an adventure of August Belmont, who arrived in the luxurious private car Oriental. The car contained Mr. and Mrs Belmont and Mr. and Mrs. H. V. R. Kennedy, of New York When the train stopped at Leadville yesterday for dinner, Mr. Belmont seized his kodak and hailing a cab started up town at a brisk pace to "take" a few natives. When he returned to the station he was amazed to find that his train had gone. The Rio Grande officials, learning of the New Yorker's predicament, ordered the train to be held at Malta, and Mr. Belmont boarded a swich engine and started down the mountain side. The speed around curves and over gulches became too swift for his nerves, and handing a $20 note across the boiler head, he shouted to the engineer to go slow and let the train continue to wait. When he overtook the express an hour's time had been lost, and the train was delayed just one hour and fifty minutes in arriving in the city.

"Some men," said Uncle Eben, "kin train er dog ter do anyt'ing dey tells 'im an' at de same time raise de mos' disobejintest chillun in de neighborhood."—*Washington Star.*

KENNEL NOTES.

NAMES CLAIMED.

Mr. T. C. Moxham claims the name King Krueger for beagle dog whelped Sept. 7, 1896, by champion Royal Krueger—champion Elf.

BRED.

Mr. T. C. Moxham's Marguerite, beagle bitch, Feb. 28, to champion Royal Krueger.

Miss Sadie C. Spooner's Bloom, pointer bitch, Feb. 4, to champion Lad of Kent.

Mr. J. Danforth Bush's
Careless, bull bitch, Jan. 28, to His Lordship II.
Duchess of Leinster, bull bitch, Jan. 26, to His Lordship II.

Wheeling.

Communications for this department are requested. Anything on the bicycle in its relation to the sportsman is particularly desirable.

THE FIRST LESSON.

FOR several months I had been trying to persuade my wife to learn to ride a bicycle. She put it off on one pretext or another that seemed trivial to a confirmed wheelman like myself till a week ago, when much to my gratification she said she was ready to begin. The occasion for this change of heart was my birthday, and it was in honor of the event that the date had been chosen.

I had already selected the riding school where she was to learn and had gotten her tickets, but at the last moment before leaving the house the tickets were nowhere to be found.

I was feeling a trifle nervous at the responsibility of introducing my wife to the new world of the wheel, and I am afraid I spoke irritably about the loss of the tickets and blamed Nellie for their disappearance, though, to tell the truth, I knew I had put them somewhere myself and couldn't be sure whether it was on my bureau or in the drawer of the writing desk; but Nellie was serene and gracious and did not pick me up or attempt to demonstrate my error.

Of course her equanimity made me ashamed of my attempt to shift the responsibility, and I endeavored to atone by telling her what a good little girl she was to give up her engagements and home interests just to please me, and then I pictured to her the good times we would have on country roads together, and lastly I remembered that I had another reason for being grateful to her for going this day, as she had recently complained of pains in her back and bones and limbs, which in connection with a certain feverish glow on her face, which I had noted suggested grip, and I mildly expostulated at her venturing out in defiance of that dismal disease.

Nellie assured me that she felt in no danger of the grip, but as we neared the school she grew manifestly nervous. Several times she asked me if I considered learning to ride an easy thing, and when I told her yes she did not seem thoroughly assured. Thinking it would give her confidence, I told her that, aside from learning to mount, she would have no difficulty whatever.

"A woman's wheel is so easily managed, and the instructors so careful," said I, "that there is no possible danger of falling or hurting yourself."

Contrary to my expectations, she did not accept this as the oracular utterance of wisdom, though as a rule she believes implicitly what I tell her on subjects with which she is not familiar, and I must confess that for a moment I felt ashamed of her lack of grit and lack of confidence in me.

The next instant, however, I saw that the nervousness she felt at taking up this new and untried art was beyond her control, and that it was partly due to a desire to do well and appear well before me and a fear that she wouldn't, and so I passed it over, and also her request not to be introduced to any of my friends or acquaintances who might happen to be present at the school.

It did not occur to me till after we had reached the place and she had disappeared in the dressing room that I had not made an engagement for her. I am not accustomed to such lapses, but Nellie's decision to take this first lesson had been somewhat unexpected, and I had hardly had time to figure out the matter in all its ramifications. Fortunately the manager thought he could work her in without any serious delay, and to make sure I walked over to have a few words with the young lady clerk at the desk.

At this moment, however, Nellie appeared from the direction of the dressing room clad in a very becoming costume, which I had not seen before, and I waited an instant to compliment her on her appearance. Then I turned to the clerk, but that young lady for some occult reason appeared suddenly to have lost the good sense that a moment before characterized her comely face. Instead she was laughing in an inane kind of way that at once lowered her a good many notches in my estimation. I began asking her about the previous engagements on her books, but before I could come to any understanding an instructor came up and said that he had half an hour's spare time to devote to a lesson, and accordingly I gave up trying to get any satisfaction from the young lady.

As we walked across the hall I heard the instructor say to my wife, "Will you have the same wheel you had yesterday?" She turned and looked at him in a rather odd way, and he at once begged her pardon and explained that he had mistaken her for another lady he was teaching. The incident slipped from my memory for the time being, but later on it was recalled.

I sat and watched Nellie as the instructor walked beside her till she had made several circumnavigations of the place. She seemed to sit on the wheel remarkably well, and I took pleasure in thinking how sweet she looked. Presently the instructor got his own wheel, and holding on to her handle bar with one hand, hopped along for a few steps and then slipped easily into his own saddle. I could hardly believe my eyes to see the feat accomplished and to see Nellie riding there, guided only by a slight touch on the steering bar of her wheel. As the two came around, pedaling at double the ordinary speed and passing other riders neatly, I could not help applauding; and Nellie looked over at me and smiled, when, according to all precedent, her gaze should have been stonily fixed on the front wheel of her mount.

And so she made the circuit half a dozen times. Then my eyes were distracted to the scene of a slight accident at the other end of the hall, and when I looked for her again—could it be true?—she was riding alone. Yes, sitting up straight, with a somewhat strained expression on her face. Nellie was guiding her wheel unaided among the other riders and around the padded pillars, while the instructor jogged along at a dog trot and made short cuts to keep within reasonable distance in case of emergency.

She gave up after a few more turns, and as she came opposite me dismounted.

To say that I was proud and happy at her performance would be putting it mildly. I gave the instructor 50 cents for cigars, and congratulated the manager on securing the services of so competent a man; and I told more than one of my friends who were present that it was the first time my wife had ever been on a wheel.

She meanwhile seemed strangely demure and quiet, and it was not till we reached the young lady at the desk that I understood the reason. It came like a bolt of lightning in a clear sky.

"I want to ask your pardon," said my wife to this person, "for the way I made faces at you when my husband asked

about an appointment. He did not know that I have been coming here for two weeks. It is all a surprise for his birthday."

The young lady laughed some more, and it was I who looked inane this time.

"I hope you are pleased," said Nellie as she clung to my arm, and we breathed the fresh outside air and walked along under the kindly robe of night that even the city lights could not entirely deprive of its property of shielding from unwelcome observation.

"You said it was so easy to learn, but I didn't find it so. I could show you black and blue bruises all over my body, and when I spoke once in your hearing of my aches you thought it was the grip." Here Nellie sighed. "I did it all for your sake, and I am glad now that I have learned. But," and here her voice trembled just a little, "it is the first and last time I will ever keep anything from you. They say a woman can't keep a secret. I don't care. I never want to."

DAN DALY.

ANSWERS TO CORRESPONDENTS.

W. Grafton.—Will Grafton please send us his address?

F. N. C.—The inside of the mouth of a pointer bitch is covered with warts. What is the remedy? Ans. Give compound sulphur tablets and apply tincture of iodine to the warts daily.

N. D. M., New Haven.—Would you inform me the weights of some of the largest pickerel caught in the United States and also the weight of the largest on record? Ans. Our record is of a 35lb. fish taken in Pennsylvania.

S. S. G., Woonsocket, R. I.—A party of fishermen before going onto the pond make up a pool for the man catching the largest fish. Mr. G., seeing a tilt fly up, instructed guide to pull in fish, which proved to be largest one caught. Does the pool belong to Mr. G. or to Mr. W., who caught the next largest fish? Ans. The prize should go to the man who caught the next largest fish. The fish taken by the guide should not count.

J. S., Mechanicsville, N. Y.—My two-year-old foxhound does not eat and is very dumpish; vomits occasionally; eyelids swollen and a brown watery substance (not matter) continually running from them. He has never had distemper or any other disease until now. Remedies I have given him appear to do no good. Ans. Bathe the eyes three or four times a day with a hot solution of boracic acid (teaspoonful of boracic acid to two pints of hot water). Give tonics.

Yachting.

As the yachting journal of America, the FOREST AND STREAM *is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.*

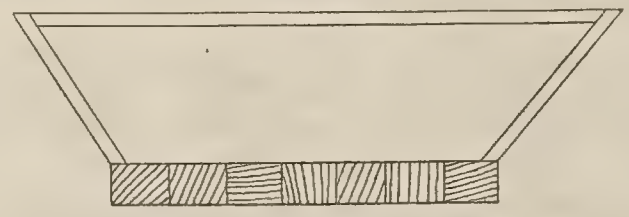
WITH the building and racing of large yachts in such a condition as it has been for several years and must be for the coming season, one looks for all sorts of wild and absurd schemes for the revival of the sport. Even the very discouraging outlook, however, does not justify anything so utterly absurd as the proposal of the Boston *Herald* at intervals during the winter for the establishment of an international cup for the 46ft. class. As this class has only been dead for five years, it is quite within the bounds of probability that the Boston *Herald* has not yet grasped the fact, and is still rejoicing in the belief that it is alive and flourishing.

The 46ft. class was created in 1891 for no good reason, but merely for a change from the 40ft. class, which was still in existence. The new class served to kill the old one, and yet never had sufficient vitality to carry itself beyond the second season, 1892. The building of Wasp in that year, and her victory over Gloriana and Harpoon, practically ended the racing of the class. In the next season or two Gloriana made an unsuccessful fight against Wasp, and since then the latter has been the 46ft. class, though sailing with larger or smaller cutters and with schooners for want of any competitor in the class. Last year the class ceased to have even a nominal existence, the New York, Larchmont, Seawanhaka and Atlantic clubs, with the Sound Y. R. U., dropping it entirely from the list of classes. It is still in the book of the Eastern Y. C., but that club has given no races for yachts of this size or larger for some time, and the class was actually dead in the East long before its final demise about New York. Even if the present rules of all the large clubs but the Eastern did not bar the class entirely, as they do, it would still be an impossibility to galvanize it into life by an international cup or any other means.

There is no question whatever that the thing most needed for the revival of yacht racing in this country in the classes above 50ft. or so is an international race; but it is equally clear that no more international cups or trophies are needed, there are plenty now on one side of the water or the other. There is no need whatever for a trophy to supplant the America's Cup, provided that this one great trophy be open to yachts such as men are willing to build, and on perfectly fair terms. That this has not been the case in the past is well enough known, but there is no reason why a change should not be made that will bring out a challenge for the Cup. At the present time the competition is practically limited to the 90ft. class, under what conditions neither the holders of the Cup nor anyone else can say. It is plainly evident that no British yachtsman is desirous of building a 90-footer for racing either here or at home; in fact, it is doubtful whether any more Meteors, Ailsas or Valkyries will be built unless by royalty, or possibly by some wealthy manufacturer as an advertisement. The signs of the times in England are toward a yacht of nearer 80ft. l.w.l. than 90.

As far as America is concerned, a still smaller size would be more generally popular and more certain of individual instead of syndicate support, down to 70ft. or 60ft. racing length. The latter class, quite as large and very much faster than the old 70-footers that were once the backbone of American racing, would be better than the former.

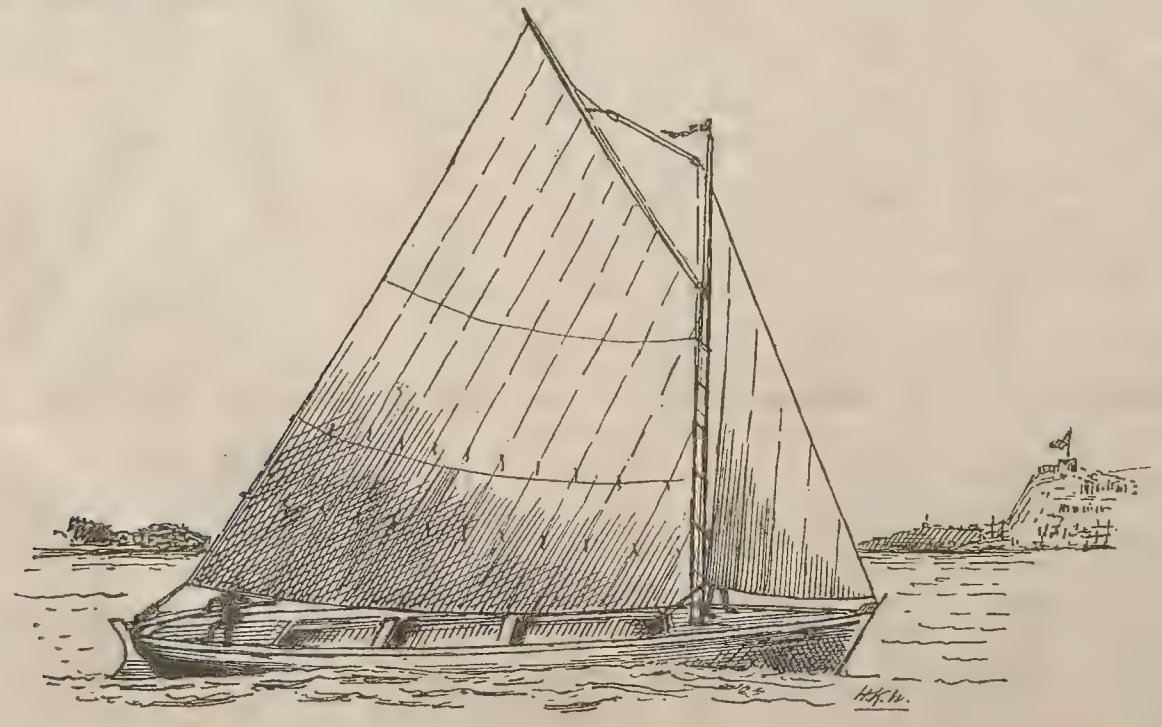
If international racing is wanted, and certainly it is badly enough needed, the New York Y. C. can open the way to it speedily by a clearing up of the existing muddle as to the meaning of the new deed in the light of the latest interpretation of the mutual agreement clause; by making it plain that it will give perfectly fair terms to a challenger, and by a positive statement that it will meet a yacht of less than 90ft. with a defender of the same measurement.



If men wish to race anything as small as the late 46-footer for the America's Cup let them do so; such a yacht, even the new 51-footer, is perfectly capable of crossing the Atlantic on her own bottom and also of making quite as good a contest for the Cup as was ever witnessed in craft of double the size. The experience of a dozen years has demonstrated the impossibility of maintaining a racing class of even 80ft. l.w.l.; and also that if the Cup contests be limited in any way to the largest sizes of yacht they must be held only at proportionately long intervals. Great as it is, the America's Cup is not a bit too good or too sacred to be raced for by such yachts as men on both sides of the ocean are willing to build, provided that they are more than mere sailboats, as demonstrated by their ability to make the Atlantic passage under their own canvas and on their own bottoms. Yachting in this country has already suffered severely enough from the long-continued effort to force the racing into one moribund class, the 90ft., and there is no reason whatever for a similar attempt to foster international racing in a class that has no existence, actual or nominal.

TEN years ago, in 1887, and again in 1892, the fleet of the New York Y. C. raced around Cape Cod, from Vineyard Haven to Marblehead, for prizes given by J. Pierpont Morgan, then owner of the steam yacht Corsair I. This year Mr. Morgan is commodore of the club, with his fine steam yacht Corsair II. as flagship, and he proposes to follow a like programme in taking the fleet to the eastward, possibly to Bar Harbor. To this end he has provided very liberally for prizes for both sailing and steam yachts. So far as inducements go, there is everything to warrant a good race; but when we come to the question of the yachts which will compete, the outlook is by no means so promising. In the schooner division there is Colonia and possibly Emerald; the former is a certainty, but Mr. Maxwell's boats never go east of Newport or the Vineyard. It is to be hoped, however, that this year Emerald will cover the whole course of the cruise. The only other modern schooners, Amorita and Quissetta, are too small to make a good race with the 90-footers, and their possible entry can add nothing to the interest in the duel between Colonia and Emerald.

In the large division of the cutter class there is as yet nothing; in fact, the available single-stickers for the two classes are possibly Navahoe and Vigilant, Queen Mab, Wasp, Uvira, the new Gardner boat Syce, and the new Fife boat for Mr. Mills. No other new yachts are building, and there are no other old ones that will enter against the few named. The race will show one thing, if it does nothing more: the vast difference in yachting in 1897 as compared with 1887.



The Quebec Bateau.

THE Quebec bateau is a boat of about 50 tons, perfectly flat-bottomed, the bottom being composed of heavy timbers bolted together, the body plan being as shown in cut. Although she has absolutely no keel, the flat side enables her to ply to windward even when light. Formerly all bateaux were rigged with a standing lug, the yard being always aloft and swinging around the intersection with the mast by means of a tackle attached to the forward or short arm; the tackle

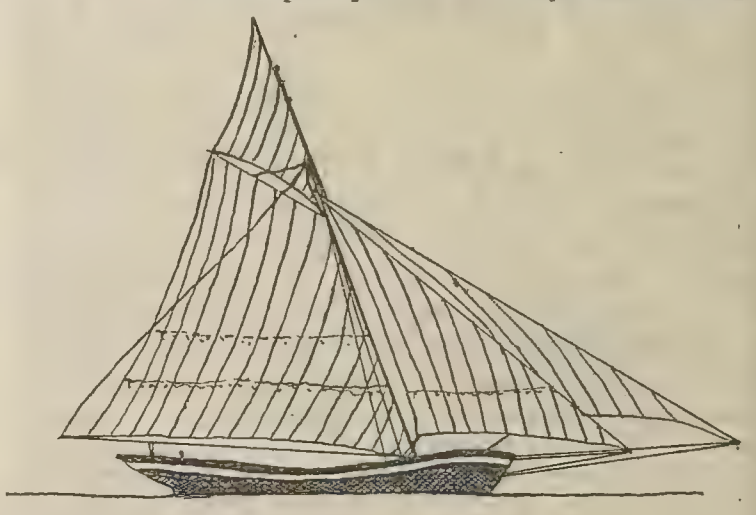
QUEBEC BATEAU.

being let go the yard "up-ended" alongside the mast, and the sail was brailed in. On account of uncertainty in stays, making prodigious efforts necessary on the part of the "foremast hand" with a huge oar over the stemhead to bring her about, the lug has gradually given way to the sloop rig, shown in the sketch, but the method of furling by means of brails still remains in force, leading the sail all against the mast, and the great, open hold readily accessible and unencumbered.

QUEBEC BATEAU.

These boats go aground on their flat bottoms on the equally flat bateaux at low tide of the lower St. Lawrence, and such is the strength of their construction that they are very often loaded to their full capacity while ashore from carts and wagons which drive up alongside. The next tide floats them out to the shipping at anchor in the stream, where they discharge through ports in the ship's side and return to the mud flats for another load. The bateau was not invented; it was developed, and stands to-day an example of the "survival of the fittest." Manned by only two men, she will often make voyages of considerable length, and to see one of them range up alongside a huge three-master in a 15-knot breeze and a 6-knot tideway is a whole education in seamanship.

H. K. W.



The Cruise of the Smack Energy—1832.

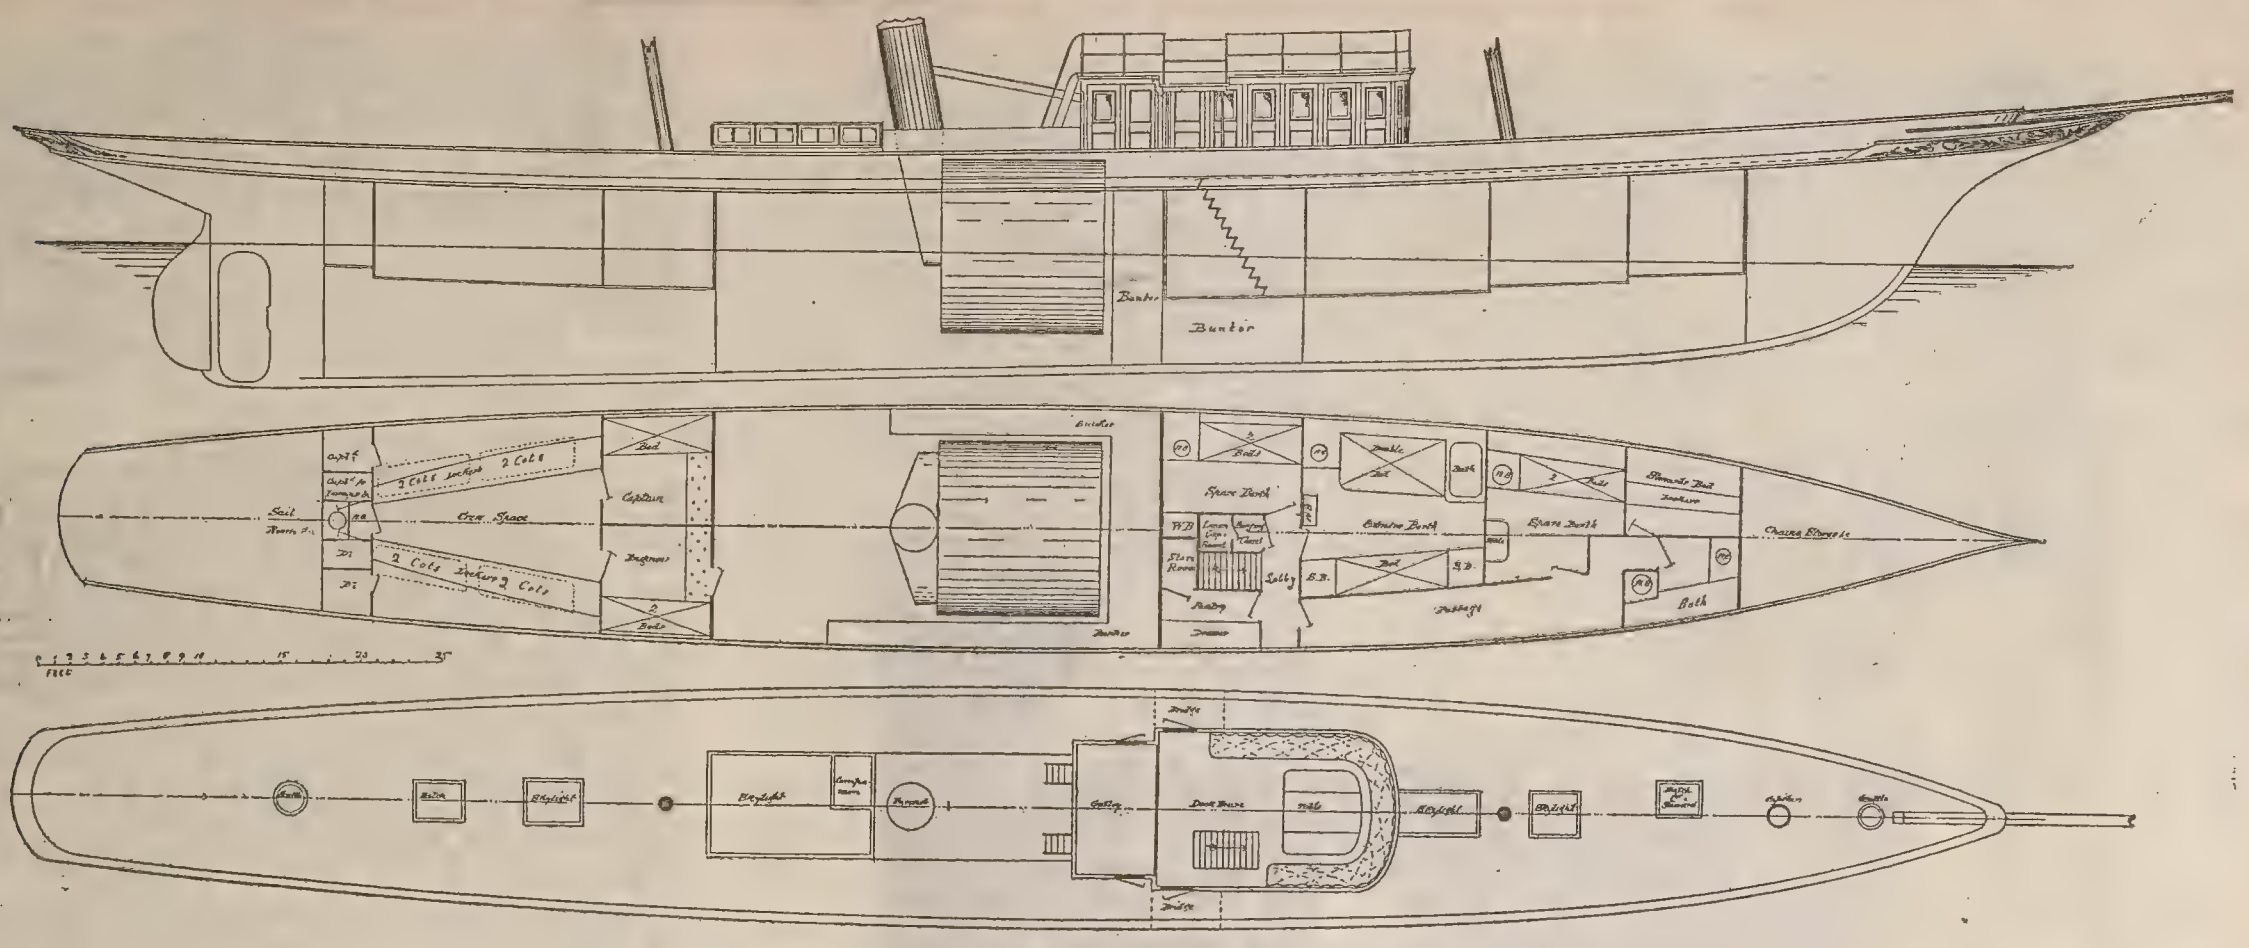
THE letters from which the following extracts were taken were written by the late John B. Meigs, U. S. N., to his brother Henry Meigs, Jr.; they are now the property of Henry Meigs, Esq., of Bayonne, N. J., to whose kindness, and that of J. W. Ellsworth, Esq., we are indebted for the privilege of printing them. It is possible that their publication may be the means of bringing to light further particulars of a voyage that must be classed as remarkable when the small size, the build and rig of the craft are considered. The hardy Yankee sailors, however, seem to have taken it as a matter of course. The picture is a reproduction of a small pencil sketch which shows the rig clearly enough, but little is said as to the model and dimensions of the hull. Mr. Meigs went out as a passenger to join his ship, then in the South Pacific.

The first letter is postmarked Boston, July 14 (1832), and is addressed to Henry Meigs, Esq., New York city, U. S. of America.

ON BOARD THE SMACK ENERGY, at the Oven, lat. 45° 6' S., long. 66°, Coast of Patagonia, Jan. 15, 1832.—*Dear Brother:* We arrived here on the 8th inst. from Mystic, Conn., from whence we sailed on the 7th of November, 1831. It is true that these vessels are remarkably small, but I feel very much prepossessed in their favor; they are both smacks, such as you have in New York, and are remarkable for sailing. After sixty days' passage out here, and have laid to but once since we left, and that was when we first made the coast, the wind being from S.E. to S.W. We have had several very severe gales since we left, in which I think any other vessels would have been obliged to lie to, but we settle our mainsail and take the bonnet off the jib, hoist the jib and set the trysail, pull the tiller out of the rudderhead and let her go; she is like a duck and measures thirty-eight tons and the other thirty-four. The one that I am aboard of is a remarkable little craft for sailing, and ever since we left we have not had dry decks for more than ten days, all in all. They are bound to Valparaiso, to carry on the fishing trade between that port and the islands of Massafuero and Juan Fernandez, and there is no doubt but that they will make a fortune shortly. We intend to go through the Straits of Magellan after we get a supply of wood and water at Port Desire, about 350 miles to the Sd. of this. We are so equal in the sailing of these two vessels that we have not been out of sight of each other more than five minutes since we left Mystic; the persons belonging to these vessels are not over thirty-five years of age, and all from the same town.

The harbor that we are now in is narrow, but very deep, and so crooked that no wind can touch you except the "whilliwows," as the sailors call them, properly called whirlwinds. It is completely surrounded by rocks running

perpendicularly from 200 to 500ft.; at the tops of them, as far as your eye can reach, nothing can be seen but a dry kind of stubble and what they call Turks' heads, which grow to the size of a barrel head and are covered with thorns of 4 to 5in. in length; and a kind of bush which produces a small blackberry of the size of the huckleberry, and very spicy to the taste, which is, I believe, the principal food of the animal called in this country the guanacka, which is precisely the same as the llama of Peru, but rather larger.



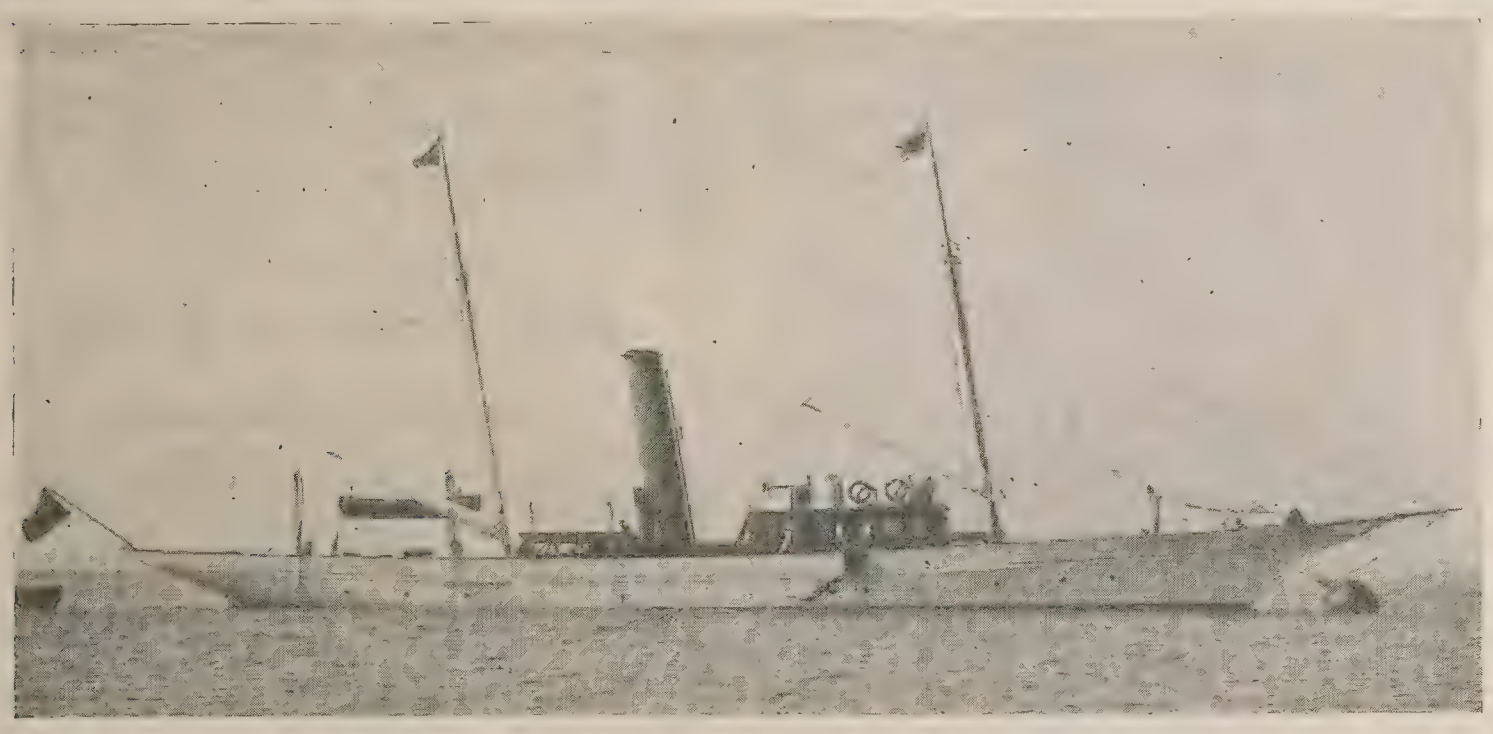
I took a boat the other day and went down to the mouth of the harbor to look for shells, but I got nothing but a few limpets. Sailing along the beach, I saw one of these guanackas walking on the beach; he soon directed his eye toward me and walked along the beach abreast of me as far as I went; and then I stopped to pick a few limpets off the rocks, and looking ashore I saw twelve more of the same kind. I tacked ship and ran along the beach pretty fast, and they all trotted along to keep abreast of me; and when I went into the harbor they trotted along on the tops and edges of the cliffs and the rocks; sometimes they seemed to be directly overhead and sometimes a little further off; they followed me up to the vessels in the harbor. In the marshes here there is the same kind of samphire that grows in all our Northern States.

We have just finished hauling our vessels ashore to scrub. On our passage we killed an albatross measuring 13ft. from the tip of one wing to the other. There are various kinds of birds here, but none of very beautiful plumage: the condor, the white crane, and several species of ducks, and millions of penguins the size of a large goose. They stand perfectly erect and get 300 or 400 together in a flock; they will not move for you when walking on the beach, but on the contrary will attack you if you do not get out of their way. There are ostriches here, but I have not seen any of them. When I arrive at Valparaiso I will give you a more detailed account of my voyage.

This harbor has derived its name from the intense heat during all seasons; there is a well of water here which seems to be made of a solution of alum and saltpeter; it is singularly strange that this water is cold nearly to the degree of zero in the middle of the day, and as soon as the sun sets it is so warm that it is scarcely fit to drink. This place is so completely devoid of vegetation that it is not astonishing that no one has ever attempted to make a settlement here.

Please report us to the editor of one of the papers, so that the friends of the young men may hear from them (they are all well), not forgetting to mention the names of the two vessels, and of their keeping company so well. The names are these: the Energy, Capt. Thomas Eldridge, and the Relief, Capt. Charles Chapman. I send this letter by the schooner Union, of Boston, returning home from a sealing voyage.

OFF VALPARAISO HARBOR, Pacific Ocean, Smack Energy, Feb. 29, 1832.—*Dear Brother:* You will confer a favor on me,



SPEEDY STEAM YACHT, DESIGNED BY DIXON KEMP FOR BARON BARRETO, 1895.

and the young men belonging to this vessel and her companion, by announcing their arrival at Valparaiso. It is now about 2:30 P. M., there is a ship in sight, and we are both becalmed; she appears to be bound out, and if so you will receive this upon her arrival in the United States. We have had a very good passage of sixty-three days to the mouth of the Straits of Magellan, where we were detained by adverse winds and currents. We spoke on our passage to the Straits the schooners Penguin and Union, the former of Stonington, and the latter of Boston; also the schooner Montgomery, of Mystic, Conn., all three on sealing voyages, and all well.

We sailed from New London on the 7th of November last, and on the 7th of January we came to anchor in a harbor on the eastern coast of Patagonia, called by sealers the Oven; it lies in lat. 46° 6′ S., long. 66° W. We had a fine run of three days from this place to the Straits of Magellan. We have had altogether a passage of 111 days from New London. I will be your debtor if you will be so kind as to advertise the substance of this letter. We have all been and are now in excellent health. These are the smallest vessels that ever came from the United States to this part of the world; the Energy is 38 tons burthen and the Relief is 34 tons, and commanded by two very enterprising young men. We have never parted company for more than ten minutes during our passage, and the vessels are remarkable for their equality in sailing in every point. When the next opportunity offers I will give you a more detailed account of our passage. I will be much obliged if you will, after having had this advertised, send one of the newspapers that contain it to Asa Fish, Esq., of Mystic Bridge, Conn., where most of the young men belong.

P. S.—You will perceive an alteration in the date of this letter; the vessel that I saw off the harbor was a Yankee whaler waiting for her boat at this place. This letter you will receive by the brig Montezuma, of Baltimore, which sails this day. You will find below a list of the young men attached to the vessels:

BELONGING TO THE ENERGY.	THE RELIEF'S MEN.
Thomas Eldridge, Capt.	Charles Chapman, Capt.
David Kellogg, 1st Mate.	John Parks, 1st Mate.
Austin Packer, 2d Mate.	James Bennett, 2d Mate.
Shubael Brown, Carpenter.	Robert Brown.
John Anthony Wolfe.	Giles Williams.
William Williams, colored man, Cook.	Richard Rogers, Cook.
And myself, passenger.	

SPEEDY STEAM YACHT. DESIGNED BY DIXON KEMP.

It would be interesting to know more of the fortunes of these plucky and enterprising young men, and further details of the staunch little craft that carried them so far in safety. Possibly some further records of the voyage may still be in existence among their descendants.

The New Montreal 20-Footers.

THE *Mail and Empire*, of Toronto, gives the following account of the new fleet of racing 20-footers now under way at Montreal:

While preparations have been going on in the United States for a successful battle for the Seawanhaka international trophy for small yachts, which at present is held here in the custody of the Royal St. Lawrence Y. C., Canadians have not been sleeping. While hockey, and skating, and snowshoeing have seemed to monopolize the efforts and the time of our amateur sportsmen, there were many busy in a quiet way preparing for the coming yachting season, and figuring out what would be the surest and best way to keep the much-coveted trophy which Glencairn brought home in our midst. Syndicates were got up and orders given for plans for a new yacht house, and plans were discussed for the boats that were to defend the cup, and finally orders were given to have the boats designed and built, and for the last three months G. Herrick Duggan, to whom naturally almost every one around Montreal who desired to share in the honor of de-Though the river and lake are still covered with ice, and though the usual freshets, with their accompanying damage to boat houses and wharves, have not yet set in, already three of the new boats are ready to try their luck, and before many days at least two others will be far enough advanced to be launched also. At present these boats, finished and partly finished, are kept carefully guarded in a shed at Lachine, and not even the prospective owners are allowed to see them. Several people who have really no business about the shed, or any direct interest in the boats, have already tried to get admission to them, and there is not the slightest doubt that some of these were emissaries from some of the builders and prospective owners of competing boats across the line. In addition to the boats at present at Lachine, there are others, however, some already finished, and others that have not yet passed the embryo stage of design. The boats now at Lachine were designed and built for G. A. S. Hamilton, Shirley Davidson, A. F. Riddell, W. A. C. Hamilton, Duggan and Shearwood. In nearly all cases these gentlemen are the heads of syndicates. All these boats have been designed and built by Mr. Duggan, and beyond these he has several other orders from Montreal and elsewhere, most of which it will be totally impossible for him to fill. Among the latter is one from Harrison B. Young. Three of these are already built, and others are far enough advanced to justify the expectation that they will be ready and entirely finished by May 1, so that they may take part in the preliminary trial races on the 8th and 15th, and it is also hoped that the entire local fleet will be far enough advanced to allow them all to take part in the regular trial races, which begin on the 24th.

The racing this year will be in the 20ft. class, which, although in name only about 5ft. larger than last year's, is practically twice the size. The general length over all will be between 28 and 32ft., and the beam from 6 to 8ft. 6in. The limit of sail area set by agreement with the Seawanhaka Club is 500sq. ft., and from what can be learned up to the present time the majority of boats will carry their full allowance, although in one or two cases the owners will try for better reaching qualities, with less sail and more length. It is impossible for the present to get anything near the definite dimensions of the boats now under construction, or any of the details of their build, but it is more than probable that they will be about equally divided between fin-keel and centerboards. Among the other boats which will take part in the trials is one which is being designed by Rev. Mr. Kittson, who last year owned the Missie, which proved to be such a fine heavy weather boat.

Longueuil will in all probability contribute two to the fleet. Mr. Maybee, of Longueuil, has one boat finished, and is about to commence another. Cuthbert, of Toronto, is completing a boat for J. B. Abbott, of Montreal, and this will probably compete in the early trial races in Toronto before it comes here, and will try to carry away the $100 prize which has been offered by the Royal Canadian Y. C. for the best 20-footer. There are several other boats talked of in Toronto. It is generally hoped that Kingston will at least have one representative in the trial races, and Halifax has also expressed a willingness to contribute a boat, but the difficulty of transportation is so great that it is hardly possible that the Haligonians will be unable to compete. At any rate there is no lack of enthusiasm, and there is every prospect that before the final event comes off there will be some most interesting trial races, which will result in the selection of a boat fully fit to cope with anything that may be designed or built in the United States.

Work on the new club house of the Royal St. Lawrence Y. C. will be commenced within a couple of weeks.

The Steam Yacht Speedy.

THIS handsome little ship was designed in 1895 by Mr. Dixon Kemp for Baron Barreto, an English yachtsman, and was built by Ramage & Ferguson, at Leith. The interior arrangements were planned by the owner, Mr. Kemp having charge of the lines and specifications. The hull is of steel, with four bulkheads, and the vessel is rated 100 A1 at Lloyd's. The contract called for a speed of 12½ knots on a run of five hours at sea, with natural draft and not over 150 revolutions. This speed was made on the trial trip with 133 revolutions, and on a subsequent trial over the measured mile with natural draft a speed of 13.05 knots was attained. The details are as follows:

Length over all	134ft. 6in.
on L.W.L.	108ft.
for tonnage on deck	117ft. 10in.
Breadth	16ft. 2in.
Depth, top of beams to top of floors	10ft. 4in.
Draft of water aft	9ft. 6in.
Tonnage, Lloyd's Y. M.	141 tons.
Area of L.W.L.	1,250sq. ft.
mid-section	96.2sq. ft.
Displacement on trial, tanks full and bunkers half full	178 tons.
Displacement per inch of immersion at L.W.L.	3 tons.
Diameters of cylinders	12in., 19in , 30in
Stroke of pistons	21in.
Length of boiler	9ft.
Diameter of boiler	10ft. 6in.
Diameter of furnaces (two)	3ft. 2in.
Grate area (total)	36sq. ft.
Heating surface (total)	1,003sq. ft.
Working pressure	180lbs.
Screw propeller, diameter	7ft. 9in.
pitch, mean	10ft. 10in.
Surface of all blades (four)	16sq. ft.
Revolutions on measured mile	138
Indicated horse power	395
Speed (mean) in knots, natural draft	13.05
with forced draft	13.05 knots.
Slip, per cent., of propeller	11
Total weight of machinery, steam up	59 tons.

The yacht is very completely fitted with all modern auxiliaries, electric light plant, See's patent ejector, steam windlass, Caird & Raynor's evaporator, Parson's ashpit forced draft. The propeller is of manganese bronze. The furnishing is very elaborate. The illustation shows the handsome and shipshape appearance of the vessel.

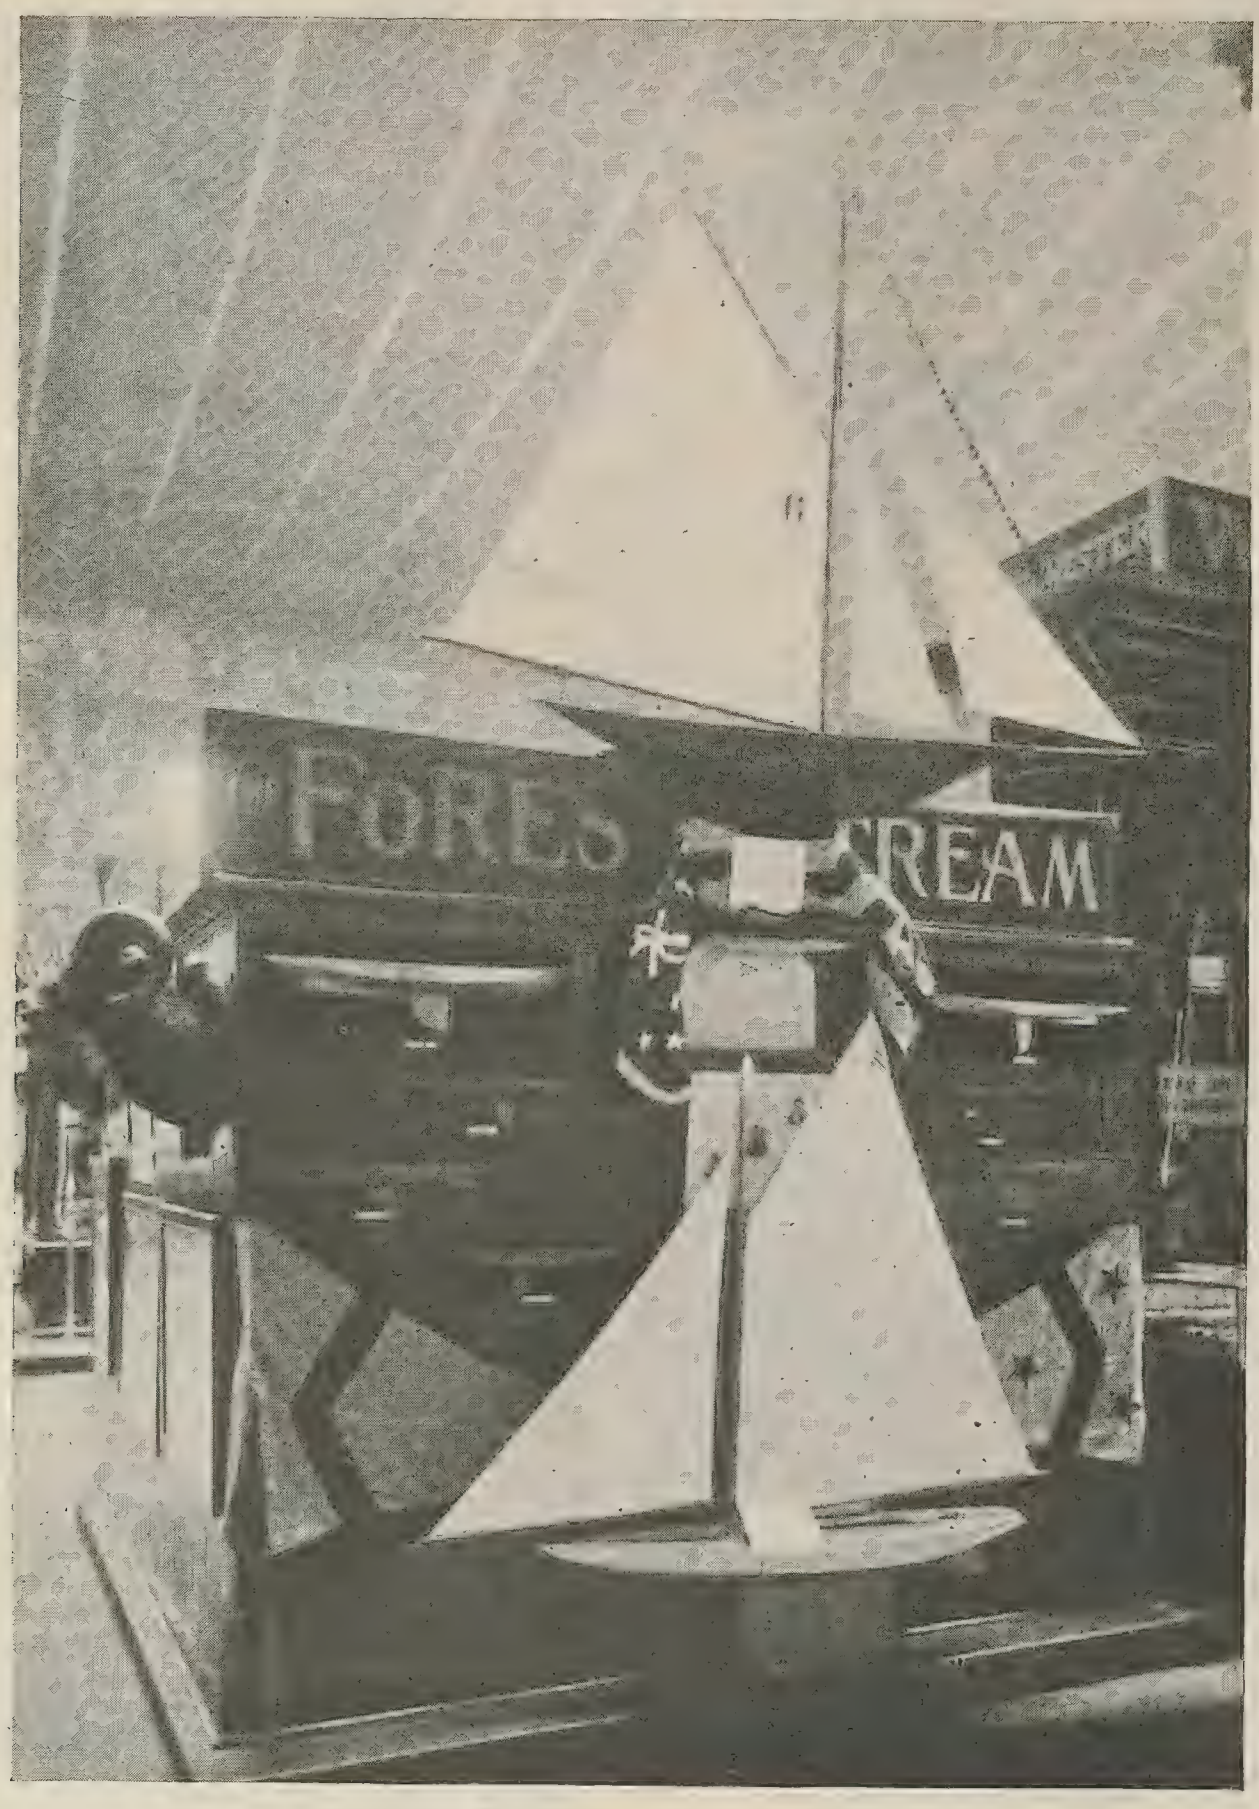
New York Y. C.

THE regular meeting of the New York Y. C. was held on March 25 at the club house, Vice-Com. Ledyard presiding in the absence of Com. Morgan, who sailed on the preceding day for Europe. The following letter was read by Secretary Oddie:

"NEW YORK, Feb. 16.—*Mr. J. V. S. Oddie, Secretary New York Y. C:* My Dear Sir—I beg to acknowledge the receipt of your official notice informing me of my election as commodore of the New York Y. C.

"In sending you this, my formal acceptance, I acknowledge with deep appreciation the honor bestowed. Yours very sincerely, J. PIERPONT MORGAN."

The regatta committee presented an adverse report upon the following proposed amendments to the racing rules, which were before the club for final action, and they were rejected:



PASSING AND ROUNDING MARKS.

Section 14. If an overlap exists between two yachts when both of them, without tacking, are about to pass a mark on a required side, then the outside yacht must give the inside yacht room to pass clear of the mark, except as provided in Section 15. A yacht shall not, however, be justified in attempting to establish an overlap and thus force a passage between another yacht and the mark after the latter yacht has altered her helm for the purpose of rounding.

MANEUVERING FOR THE START.

Section 15. When two yachts are maneuvering for the start, both on the same tack, one to windward and one to leeward, and the weather yacht being freer than the leeward yacht, should the leeward yacht be close hauled on the wind, and before an overlap has been established, the leeward yacht shall have the right to hold and maintain her course, even if thereby the windward yacht should be forced on the wrong side of the starting mark.

Votes of thanks for their services as commodore and on the regatta committee were tendered to ex-Com. E. M. Brown and Mr. S. Nicholson Kane. An amendment to the constitution, reducing the house committee from five to

AMERICAN MODEL Y. C.—FOREST AND STREAM EXHIBIT.

three in number, was passed. The following resolution was offered by Elbridge T. Gerry:

Whereas, There is a plan for certain improvements of the harbor of Newport, R. I., which plan contemplates, among other things, the building of a solid masonry pier 600ft. long and 35ft. broad, the pier to be utilized for carrying out a new sewer; which pier, it is stated, would be built largely for the additional facilities it would give visiting yachtsmen; and it is apparent that should the proposed pier be built, it would reduce the available anchorage ground materially and would further, by the carrying of the sewage into the harbor at this point, endanger the health of the crews of anchoring vessels; now, therefore, be it

Resolved, That it is the opinion of the New York Y. C. that the building of said pier would be of no material benefit to yachtsmen, and that it is further inexpedient to build the pier on account of the loss of anchorage room and the danger to health.

Resolved, That a committee of three be appointed by the chair to present these resolutions to and to confer with the proper authorities for the purpose of securing the abandonment of the plan, if possible; or, failing in that, to obtain such modification thereof as they may think necessary and proper.

The resolution was adopted, and Messrs. Gerry, Stephen Peabody and G. L. Rives were appointed.

Vice-Com. Ledyard announced that Com. Morgan was desirous that the annual cruise be continued eastward from Vineyard Haven to Bar Harbor, and to that end would offer three prizes of $2,000 for schooners, $1,000 for the larger classes of cutters and $1,000 for the smaller classes, for a race around Cape Cod to some Eastern port. Com. Morgan also proposes to give a prize for a steam yacht race if a suitable system of allowances can be arranged.

The following members were elected: A. Hart McKee, Frederick L. M. Masury, Josiah M. Lasell, J. Pierpont Morgan, Jr., Temple Bowdoin, Robert Bacon, Harry S. Thompson, William H. Osgood, William H. Fletcher and Alfred R Whitney, Jr.

Marietta III.

THE new steel steamer Marietta III., designed by H. J. Gielow for H. B. Moore, of the New York and Atlantic yacht clubs, was launched on March 27 at the Erie Basin Dry docks, where she was built by the John M. Robins Co. The yacht is the largest as well as the handsomest that Mr. Gielow has yet designed, being far superior to his two preceding boats of the same name. She is 172ft. 6in. over all, 140ft. l.w.l., 18ft. beam, 7ft. 9in. draft, with four-cylinder triple expansion engine and single screw. The two boilers were built by the Roberts Safety Water Tube Boiler Co., which has furnished the boilers for four of Mr. Moore's yachts. The hull work was carried out under the direction of Capt. W. D. Dickey, superintendent of the yard, which speaks for its character.

The American Model Y. C. Exhibit.

THE accompanying illustration could not be prepared in time for our last issue, but shows the very interesting exhibit of the American Model Y. C. in connection with the FOREST AND STREAM exhibit at the Sportsmen's Exposition. The upper pair of half models were made of galvanized iron, the hull being built over a last and the bulbs cast in an iron mould. By this means he is able to offer a boat complete for $250. These little craft offer an excellent opportunity to clubs that wish to establish one-design classes, as the price is very reasonable. Five are already ordered.

The Gilbert's Bar Y. C. held its usual monthly meeting and regatta on Saturday, March 13. In the first class, 22ft. and over, three boats entered:

	Corrected.
Zingari	0 42 06
Joker	0 43 18
Albatross	0 45 22

Won by Zingari.

SECOND CLASS BOATS—22FT. AND UNDER.

	Corrected.
Beatrice	0 52 51
Swallow	1 00 11

Won by Beatrice.

In addition to the two large boilers for the steam yacht Marietta III., the Roberts Safety Water Tube Boiler Co. are busy with the boilers and machimery for the schooner Hildegarde, now being converted to an auxiliary under the direction of H. C. Wintringham for Vice-Com. Whitlock, Atlantic Y. C. The firm has also in hand a boiler for the passenger steamer Martha, building at Yonkers by C. E. Pearsall for his own use. This vessel will have a compound engine designed by Thos. Flaron, the old oarsman and shell builder, who of late years has turned his attention to marine engines with marked success.

The Spalding St. Lawrence Boat Co. has recently added to its forces at the Ogdensburgh shops Mr. L. K. Young, of Bridgeport, Conn., so widely known as a maker of hollow spars. Mr. Young is a practical yachtsman and a skillful sailor in open racing boats, and his large experience has resulted in many improvements in blocks, fittings, etc., as well as in spars.

The annual meeting of the New Jersey Y. C. was held at the club house at the foot of Tenth street, Hoboken, on March 25, the following being elected officers: Com., Alfred Wenzel, slp. Wanderer; Vice-Com., William Sherman, slp. Eagle Wing; Treas., Frank S. Ketcham; Fin. Sec'y, Bernard A. Deetjen; Cor. Sec'y, Edward V. Ketcham; Rec. Sec'y, Frank Springling; Meas., Henry Nelson; Trustees: Alfred Wenzel, Alexander Berry, Theophilus Butts, Bernard A. Deetjen and Frank S. Ketcham; Regatta Committee Alfred Wenzel, William Sherman, Bernard A. Deetjen.

The Yacht Racing Union.

THE new book of rules of the Yacht Racing Union of Long Island Sound has just been published. The Union now includes twenty clubs, whose stations are on Long Island Sound. The Council has sent out the following notice:

OFFICE OF THE SECRETARY OF THE COUNCIL OF THE YACHT RACING UNION OF LONG ISLAND SOUND, New York, March 31.—Special Notice to Representatives: On Jan. 18 you were requested by circular to furnish the Council witha list of the sailing yachts of your club, so that racing numbers could be allotted them before the commencement of the season. This list I have not received from you.

It is of paramount importance that this information be furnished not later than April 5. It is purposed to number all sailing yachts enrolled in Sound clubs and other clubs sailing under rules uniform with those of the Union. This list should be as complete as possible, and comprise the following information: Name of yacht; name and address of owner; rig; racing length, if measured; class, if not measured; whether cabin or open.

Please give this notice immediate attention.

I have recorded the following dates as having been selected by your club for open races during the coming season: Annual regatta, ——. Special races, ——.

Please inform me by April 15 whether the annual regatta will be for all classes, or classes under a certain length, and for what classes the special races will be given. I would be glad to know the name and address of the chairman of the regatta committee of your club for this year. It is hoped to have the racing schedules ready for distribution by May 1.

FRANK BOWNE JONES, Sec'y.

Kerosene Stoves for Yachts.

ANNAPOLIS, Md., March 15.—*Editor Forest and Stream:* Your paper does not, I am sorry to say, contain any advertisement of makers of kerosene oil cooking stoves and outfits for yachts too small for regular coal galley.

The "Florence," years ago, used to be excellent (especially for broiling, having a special broiler that did not smoke the meat or allow drip), but I am not aware of its being made now or where. Would you kindly inform me of the maker of the best article of this kind now on sale, as I need one in fitting out this spring.

Thanking you for any trouble, J. BUCHANAN HENRY.

[We will be glad to hear from any of our readers who have had practical experience with the later makes of kerosene stoves.]

YACHTING NEWS NOTES.

W. B. Stearns, the Marblehead builder, is now turning out a fleet of one-design craft of the Scarecrow type, but of his own design. The boats are 22ft. 6in. over all, 16ft. l.w.l., 5ft. 6in. beam, and 4ft. draft including the fin, which is fixed. They are rigged with mainsail and jib, the latter set on a short bowsprit. The lines are excellent, showing an easy form, with considerable deadrise, a good freeboard and fair sheer. The cockpit is above the waterline. Mr. Stearns has planned a construction that admits of rapid work when many boats are to be built, and yet is thoroughly strong

Canoeing.

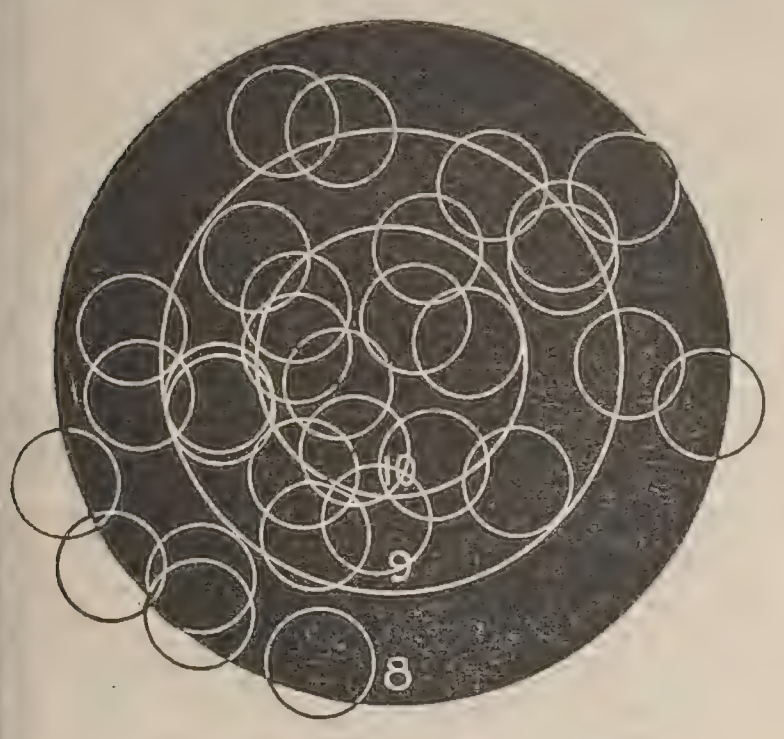
Rifle Notes.

THE Springfield (Mass.) *Union* of March 25 contains the following note relative to Stevens rifles at the Sportsmen's Exposition: "The J. Stevens Arms and Tool Co., of the Falls, is much pleased at the success which its rifles and other arms had at the recent sportsmen's exhibit in New York city, as three out of the five shooting contests which were held were won by Michael Dorrler, of Greenville, N. J., with the Stevens rifle. Mr. Dorrler also broke two records. In the individual shoot the previous record was 2,420 out of a possible 2,500, but in winning this contest he made the remarkable score 2,421 1-0. He also broke the record in the bullseye target shoot. The rifle belonging to Dr. Hodges, of Indianapolis, attracted as much attention as anything at the show. A wealthy New York gentleman, who saw the rifle, has sent an order to the company for a similar rifle and will have it engraved by the same Japanese workman who did the work on Dr. Hodges's rifle.

Madison Square Revolver Tournament.

The winners in the revolver tournament held at Madison Square Garden, March 13-20, under the auspices of the Sportsmen's Association, are given below:



Any team championship—First prize, $125 cup: Springfield Team—Capt. C. Axtell 130, Z. C. Talbot 110, J. Goodrich 128, A. Smith 130, F. Hodskins 123; total 621. New York Team—Capt. R. H. Sayre 129, Dr. A. F Webber 124, T. Beck 122, F. B. Crowinshield 125, J. B. Paine 115; total 609.

Military teams, championship—First prize, $125 cup: R. H. Sayre 129, T. Beck 124, C. Axtell 131, W. R. Pryor 115, F. W. Green 115; total 611. E. E. Partridge 122, F. D. Crowinshield 120, D. Johnson 106, F. Anderton 117, J. B. Paine 124; total 589.

Bullseye pool, *Tribune* trophy: C. Axtell 115, Dr. A. A. Webber 113.

For the *Scribner* trophy: Capt. Petty 103.

Military championship; $75 cup to first, $50 to second, $25 to third:

MR. AXTELL'S CLUSTERED THIRTY SHOTS.

C. Axtell 259, R. H. Sayre 257, F. B. Crowinshield 245, P. Hodgkins 240, W. Goodrich 238, J. B. Paine 236, Z. C. Talbot 229, E. E. Partridge 209, R. S. Edes 202.

"Any" championship, individual—First prize $75, second prize $50, third prize $25: C. Axtell 277, F. B. Crowninshield 263, T. E Beck 259, Dr. A. A. Weber 257, G. W. Waterhouse 255. Dr R. H Sayre 254, F. Anderson 252, F. Hodskins 251, J. Goodrich 250, Z C. Talbot 247, J. H. Wesson 245, A. L. Smith 241, E. E Partridge 238, Dr. S. J. Foot 232, P. Weigel, Jr., 106.

Press match: A F. Aldridge 83, James Watson 80, C. A. Bramble 75, S. N. Campbell 71, Francis Trevelyan 65, H. L. Fitzpatrick 58, Geo. Bleekman 56, E. C. Eckhart 53, A. S. Williams 53, Samuel Crane 52, George Stackhouse 50, A. F. Steiner 41, R. E. Leppert 31, J. McGinn 23.

It is noteworthy that all first prizes were won by the Smith & Wesson revolver wherever entered in competition.

Revolver Shooting in England.

The revolver shooting season opened at the North London Rifle Club on March 3. The revolvers used had to be modified from target sighted ones allowed in former years to the mongrel military made obligatory at Bisley this year. This had to be done, as the clubs are practicing grounds for Bisley, and therefore have to adopt Bisley rules. This coarse sighting will affect scoring, and in comparing this year's results with former years must be taken into account.

Members are also divided into three classes, so as to give the poorer shots a chance; but for the revolver championship of the club all will have to shoot on equal terms, whatever class they belong to. The championship will, as before, go to the shooter who has the highest aggregate of six scores in series 1, 20yds., stationary target; one in series 2, alternate hands, 20yds.; one in series 3, disappearing target, 20yds.; and two at 50yds., stationary target. One score made each day during the season.

Result of shooting, March 3:

Revolver series 1, 20yds. stationary target—Class 2: Tilbury 40, B. W. Holmes 38, W. Luff 19. Class 3: Ledger 19.

March 10.—Revolver series 1, 20yds., stationary target—Class 1: T. Knapp 37, Carter 37. Class 2: Holmes 38, Brading 37, Tilbury 37, W. Luff 31, Capt. Evans 32, Josling 27. Class 3: Lieut. Soames 29, Treadwell 28, Joyce 23.

Trap-Shooting.

Leading dealers in sportsmen's supplies have advertised in our columns continuously for almost a quarter century.

If you want your shoot to be announced here send in notice like the following:

FIXTURES.

April 2.—Geneseo, N. Y.—All-day shoot of the Geneseo Rod and Gun Club. Targets thrown from a magautrap. Shooting to begin on arrival of Rochester train. W E. Lowe, Sec'y.

April 7.—Portland, Me.—Annual spring tournament of the Portland Gun Club. Harry A. Chisholm, Sec'y.

April 7.—Hackensack, N. J.—Third contest for the Recreation cup, under the auspices of the Bergen County Gun Club, Cup contest at 12 noon sharp. C. O. Gardner, Sec'y.

April 10.—Windsor Locks, Conn.—All-day tournament of the Windsor Locks Gun Club. Targets. C. F. Cleaveland, Sec'y.

April 14-16.—Atchison, Kan.—Airy Lou Hart's third manufacturers' amateur and fourteenth open-to-all tournament. $750 added money.

April 14-16.—Baltimore, Md.—Tournament of the Interstate Association, under the auspices of the Baltimore Shooting Association.

April 15.—Youngstown, O.—First tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

April 15-17.—San Antonio, Tex.—Tournament of the San Antonio Gun Club. Open to amateurs only. Willard T. Simpson, Chairman Ex. Com.

April 16.—Bridgeport, Conn.—All-day shoot of the Bridgepor Gun Club. Targets. V. A. Blakeslee, Sec'y.

April 17.—Nutley, N. J.—All-day shoot of the Yanticaw Gun Club. Targets from a magautrap. Shooting chmmences on arrival of 9:52 train from Chambers street, New York.

April 19.—Hingham, Mass.—All-day shoot of the Hingham Gun Club. 100-target handicap. G. O. Henderson, Treasurer.

April 20-21.—Rochester, N. Y.—Tournament of the Rochester Rod and Gun Club. Targets

April 20-23.—Lincoln, Neb.—Twenty-first annual tournament of the Nebraska State Sportsmen's Association. Added money later.

April 21-23.—San Antonio, Tex.—Second annual meeting and tournament of the Texas State Sportsmen's Association. O. C. Guessaz, Sec'y.

April 27-29.—Binghamton, N. Y.—Tournament of the Binghamton Gun Club. Two first days, targets: third day, live birds.

April 27-30.—Fonda, Ia.—Tournament under the management of Geo. E. Hughes and C. R. McCord. Live birds. $800 added money.

April 28-29.—Richmond, Va.—Tournament of the Interstate Association, under the auspices of the West End Gun Club.

April 28-29.—Peru, Ind.—Tournament under the management of J. L. Head.

May 4-6.—Des Moines, Ia.—Tournament of the Iowa State Sportsmen's Association. Live birds and targets F. C. Whitney, Sec'y.

May 5-7.—Newburgh, N. Y.—Annual spring tournament of the West Newburgh Gun and Rifle Association. First two days, targets; third day, live birds. $50 average money to three high guns in all programme target events. Open to all.

May 11-13.—Peekskill, N. Y.—Annual tournament of the Peekskill Gun Club. First two days, targets; last day, live birds.

May 11-14.—Waterloo, Ia.—Tournament of the Waterloo Gun Club. E. B. Walker, Sec'y.

May 12-13.—Connersville, Ind.—Tournament of the Connersville Gun Club. Live birds. T. F. Thomas, Sec'y.

May 17-22.—Kansas City, Mo.—Annual tournament of the Missouri State Game and Fish Protective Association. Fred T. Durrant, Sec'y.

May 18.—Albany, N. Y.—Annual spring tournament of the West End Gun Club. Horace B Derby, Sec'y.

May 19-20.—Savannah, Ga.—Tournament of the Interstate Association under the auspices of the Forest City Gun Club.

May 19-21.—Canton, S. D.—South Dakota Sportsmen's Association annual. C. S. Seely, Sec'y.

May 20.—Greenville, Pa.—Second tournament of the Pennsylvania and Ohio Border Gun League. Geo H. Jones, Sec'y.

May 26-29.—East St. Louis, Ill.—Annual tournament of the King's Smokeless Gun Club.

May 31.—Canajoharie, N. Y.—Eastern New York Trap-Shooters League tournament, under the auspices of the Canajoharie Gun Club. Charles Weeks, Sec'y.

June 2-4.—Springfield, O.—Annual tournament of the Ohio Trap-Shooters' League, under the auspices of the Springfield Gun Club.

June 8-9.—Tournament of the Trap-Shooters' League of Indiana.

June 8-11.—Auburn, N. Y.—New York State Sportsmen's Association tournament. C. W. Tuttle, Sec'y.

June 9-10.—Monroe, La.—Tournament of the Interstate Association, under the auspices of the Monroe Gun Club.

June 10.—Newcastle, Pa.—Third tournament of the Pennsylvania and Ohio Border Gun League. Geo. H Jones Sec'y.

June 15-18.—Cleveland, O.—Fourth annual tournament of the Chamberlin Cartridge and Target Company.

June 16-17.—Fargo, N. D.—Third annual tournament of the North Dakota Sportsmen's Association. Targets. W. W. Smith, Sec'y

June 22-25.—Oil City, Pa.—Seventh annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Oil City Gun Club. Targets and live birds. Black powder barred. Special event: 25 live birds per man, $25, $1,000 guaranteed. Send entries to H. C. Reeser, Sec'y, Oil City, Pa.

July 14-15.—New Haven, Conn.—Tournament of the Interstate Association, under the auspices of the New Haven Gun Club. Wm. H. Hazel, Sec'y.

July 22.—Meadville, Pa.—Fourth tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

Aug. 4-5.—Lewiston, Me.—Tournament of the Interstate Association, under the auspices of the Androscoggin Gun Club.

Aug. 17-19.—Toronto, Canada.—Tournament of the R. A. McCready Co., Ltd. Targets. $1,000 guaranteed. Open to all. Write for programmes.

Aug. 19.—Warren, O.—Fifth tournament of the Pennsylvania and Ohio Border Gun League. Geo. H Jones, Sec'y

Aug. 25-26.—Montpelier, Vt.—Tournament of the Interstate Association, under the auspices of the Montpelier Gun Club.

Sept. 15-16.—Portsmouth, N. H.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club.

Oct. 6-8.—Newburgh, N. Y.—Annual fall tournament of the West Newburgh Gun and Rifle Association. First two days, targets; third day, live birds. $50 average money to three high guns in all programme target events. Open to all.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The tournament of the Rochester (N. Y.) Rod and Gun Club, announced in our last issue for April 12-14, has been postponed one week on account of the Interstate shoot at Baltimore, April 14-16. The Rochester dates are, therefore, April 20-21. Dr. Weller and Messrs. E. C. Meyer and G. Borst, forming the committee in charge, have arranged a programme of one 10, six 15, two 20 and one 25-target events for each day. The entrance fees are at the uniform rate of 10 cents per target, a total of $16.50 for the programme. Targets will be deducted from the purses at 1½ cents each. In the 10 and 15-target events there will be four moneys; in the 20 and 25-target events there will be five moneys. Five per cent. of the entrance moneys will be deducted for a general average fund, to be divided 40, 30, 20 and 10 per cent. Shooting commences at 9:30 each day. The Monroe avenue or Park avenue cars take you to the grounds. Bluerocks will be thrown from a magautrap, so that this occasion will be good practice for the State shoot of 1897.

Secretary H. T. Hearsey, of the Trap-Shooters' League of Indiana, has mailed the constitution and by-laws of the Trap-Shoooters' League of Indiana to all the clubs in the State, with a cordial request to become members and help along the good cause in which all are interested. He says: "There is no selfishness in this movement The strong clubs will help the weaker ones, and it is hoped no club will feel strong enough to remain independent of the League, or none so weak but its influence will be felt and respected. But little time remains to prepare for the annual tournament, so it is important that clubs join promptly in order that a vote may soon be taken to determine the place of that meeting." Mr. Hearsey's address is Indianapolis.

Of the Lincoln, Neb., tournament, April 20-23, Secretary Welch writes: "We beg leave to state that the affairs of this Association are in a very prosperous condition and that we expect to hold here the largest tournament that will be held in the West this year. We are going to add $1,000 in money to the prizes, and as we follow immediately after the Atchison tournament we expect to have a very large crowd here, and it looks now like our entry list will run upward of 100. Our grounds are located at Lincoln Park, about two miles from the city, and accessible by motor car. We will throw empire targets from two sets of traps and have one set of traps in reserve."

Lou Erhardt's shoot, April 14-16, is attracting the attention of the circuit shooters. Lou will have a good chance of beating his own record this year, trap-shooting being decidedly on the boom in the section that he draws from. The following week the shooters will have a rendezvous at Lincoln, Neb., for the State shoot. Then May 4-6 will find the majority of them at Des Moines for the Iowa State tournament. This schedule gives the Waterloo (Ia.) Gun Club a good chance for a large attendance, as its tournament (May 11-14) follows immediately after the shoot at Des Moines.

The Bison Gun Club, of Buffalo, N. Y., will hold a two days' shoot on its grounds at Walden avenue, City Line, April 15-16. Bluerocks will be used on the first day, all targets being thrown from a magautrap. The entrance fees are reasonable, and the programme an interesting one. Targets will be charged for at the rate of 1 cent each. On the second day there will be four live-bird events: No. 1, 5 birds, $3; No. 2, 10 birds, $5; No. 3, 15 birds, $7; No. 4, 25 birds, $15. All communications should be addressed to C. H. Werlin, secretary of the club, 1634 Broadway, Buffalo, N. Y.

Friday morning, March 26, the day after the close of the tournament at Elkwood Park, was not without its special features. The firs event was a blooded contest, viz., 10 birds, $50, birds extra. The contestants were R. A. Welch (30), D. A. Upson (30), H. S. Coldren (29) and Col. Anthony (27). Welch and Upson tied on 9 out of 10; they agreed to draw down their $50 each, and then shoot off at 5 birds for the other $100. On the shoot-off Upson won with 4 to 3, both of Welch's lost birds falling dead out of bounds.

The Interstate shoot at Baltimore on April 14-16 promises to be one of the successes of the season. During the Grand American Handicap tournament we heard of several shooters who had "promised to be there." The programme is a good one, and the $450 added money is an attraction in these days. Ship your shells in care of A. G. Alford Sporting Goods Co., 120 East Baltimore street, Baltimore, Md.

We believe that Messrs. Daly & Chanfrau, of Elkwood Park, hold the record for hotel building. They erected a twenty-room hotel, furnished it with all necessary furniture, put in up-to-date sanitary plumbing, running water, electric lights and an electric bell system in each room, in fact, all modern conveniences and they took just six days to do all this! Even with the twenty extra rooms, it was a case in most instances of "two in a room" each night of the shoot.

Tom Marshall's victory in the Grand American Handicap was a most popular win. Of course, after the shoot was over, there were lots who had picked out Mr. Marshall as the winner; as a matter of course, the "I told you sos" were numerous. The only one whom we can vouch for as having actually picked the winner prior to the shoot was Paul North. Paul guessed it the first time.

The spring tournament of the Sherbrooke Gun Club will be held on the grounds on Terrell's farm, East Sherbrooke, Good Friday, April 16. An aggregate prize will be divided among five highest guns in events 2, 4, 6, 7, 10 and 11 (75 targets). Rose system in all events except No. 1. No postponement on account of weather. Special hotel rates for shooters and free conveyance to grounds.

The Forrester Gun Club, of Newark, N. J., will hold a one-day tournament at artificial targets on their grounds on Peddie street, on Wednesday, April 28. A lunch will be provided for the shooters; targets will be 1 cent each, and a special handicap race of 50 or 100 empires will be on the programme. H. E. Winans, 97 West Kinney street, Newark, N. J., is the secretary.

The Binghamton (N. Y.) Gun Club will hold its spring tournament April 27-29. The tournament will be open to all. On the first two days the programme will be made up of target events; the third day's schedule will be at live birds. All communications should be addressed to H. W. Brown, manager, Binghamton, N. Y.

Litchfield, Conn., is to have an active gun club. At a recent meeting of the club the following were elected as officers for 1897: President, S. P. Griffin; Vice-President, Isaac Hutchinson; Secretary-Treasurer, F. Newcomb. The club starts afresh with a roll of twenty-five members, and has secured a fine ground, which is to be equipped with an up-to-date bluerock outfit.

A. W. du Bray, of the Parker gun, awoke on Tuesday morning, March 23, to find himself occupying the important position of No. 1 on the list of shooters for the Grand American Handicap. As Du Bray himself put it: "You can't keep the Parker gun down, old boy; it's bound to be first somehow."

The third contest for the *Recreation* cup, representing the amateur championship of the State of New Jersey, will be held April 7 at Hackensack, N. J., on the grounds of the Bergen County Gun Club. The cup contest will commence at 12 noon sharp.

The Western shooters ought to be satisfied, and we have not the slightest doubt that they are. They came East and bearded us boldly; they have now retired to their wigwams with an important scalp or two to their credit.

The East versus West team race fell through after all. Its failure cannot be attributed to any unwillingness on the part of the Western shooters to take part in such an event. The West was ready, but the East had not the wherewithal, viz., shooters, with which to meet her.

Billy Crosby and G. F Carraher, both of the Baker Gun Company, of Batavia, N. Y., and Jack Fanning, of the Gold Dust Powder Company, of San Francisco, were guests of the Bergen County Gun Club at its monthly shoot, Saturday last, March 27. The E. C. cup contest was the main event on the programme.

We have not yet received a line from the rooters for the "old system." We are naturally patient and easy-going, but we cannot wait much longer. The subject of "old system versus Rose system" is still open for discussion.

Our correspondents will have to be lenient with us this week. Much matter of considerable interest has had to be withheld owing to the pressure on our columns due to the Grand American Handicap tournament at Elkwood Park.

Dr. Carver was more than pleased with the result of his trip East. The Cashmore gun made a record at Elkwood Park in the Grand American Handicap; hence the Doctor's cause for congratulation.

March 30. Edward Banks.

Boston Gun Club.

Wellington, Mass., March 17.—To-day's shoot added another to the Boston Gun Club's list of successful shoots. Nothing actually startling was done in the way of scores, yet Mr Paine's 17 was quite equal to a 19 made under more favorable conditions. A breeze that carried dismay to the hearts of many present rendered 80 per cent. scoring somewhat of an impossibility. The 15yd. shooters certainly had their innings to-day, for the 17 and 18yd. people landed at the bottom of the list in a bunch. The yard or two of distance handicap meant something with a forty-mile-an-hour wind, leading the asphalt a merry chase.

ON LONG ISLAND.

NEW UTRECHT GUN CLUB.

March 27.—The New Utrecht Gun Club held its regular weekly club shoot on Dyker Meadow to day. J. A. Bennett won in Class A with 23 breaks, and Dr. O'Brien in Class B with 17 breaks. After the club shoot a series of 10-target sweeps was shot. Scores:

Audubon Gun Club, of Buffalo.

Buffalo, N. Y., March 20.—The regular weekly shoot of the Audubon Gun Club, held to-day at Audubon Park, was well attended, twenty shooters taking part in the various events scheduled for the afternoon's sport. Event No. 3 was the club badge shoot, 25 targets, unknown angles. E. C. Burkhardt was the winner in class A; Sandy in class B, and D. C. Sweet in class C. Event No. 6 was at expert rule; No. 7 at reversed pull. The results in all the events are given below:

The Grand American Handicap.

ALL RECORDS BROKEN.

THE Grand American Handicap for 1897 has broken all records. The entry list contained 146 names, 11 forfeits reducing the number of actual contestants to 135. In our issue last week we gave the list of shooters who had entered regularly, the list containing 139 names. Six post entries were received later, the names being Theo. Hostetter, Pittsburg, Pa.; J. Rehrig, Lehighton Pa.; Frank Class, of Morristown, N. J.; Sporting Life, of Philadelphia, Pa.; B. L. Packard, New York city; Frank Lawrence, New York city. The name of A. W. Sherman, of Freehold, N J., was left out of our list last week through error; he should have been the last on the list, making 140 regular entries.

Among the withdrawals were: W. H. Sanders, of New York, who had the misfortune to be injured in the radiator explosion in a Turkish bath; Seth Clover, who was limping around with a bad case of "charley horse;" John H. Shaffer, of Pittsburg, sickness; Dr. J. H. Wert, of Long Branch, grip. Other withdrawals for cause were: Fen Cooper, of Mahanoy City, Pa.; T. D. Hooper, New York city; A. S. Hunter, Utica, N. Y.; Tom Farmer, Pittsburg, Pa.; E. S. Rice, of Chicago; M. M. McMillan, Mahanoy City, Pa.; and A. W. Sherman, Freehold, N. J.

MORE POPULAR THAN EVER.

From the above figures it can be seen that the Grand American Handicap is more popular than ever. An entry list of 146 in a 25-bird race, $25 entrance, birds extra at 30 cents each, *without one cent of added money*, speaks volumes for the popularity of this annual event.

In 1893 the Grand American Handicap was started with a list of 21 shooters; it was shot off that year at Dexter Park, L. I. In the following year, 1894, the event was again shot off at Dexter Park, L. I., but the entry list had grown to 54. In 1895 the Grand American Handicap was shot at Willard Park, Paterson, N. J., the list of entries that year showing a healthy increase over that of 1894: 61 entries with 58 shooters was the total for 1895. In 1896 a move was made to Elkwood Park, and a new system of dividing the moneys was tried. The result was a big jump in the list of entries: 109 shooters entered, 104 taking part in the event

Then came this year's contest. The choice of grounds was left to the tournament committee, and although several locations were examined, when the committee saw the Elkwood Park grounds there was nothing else in it. It was a case of Elkwood Park or nothing. These grounds have been described so often in these columns that it eems superfluous to say anything more in regard to them. The accompanying cut will enable our readers to follow with ease the de scription of how the Grand American Handicap was run, and will also give an idea of the manner in which the three sets of traps are ocated.

There are no such grounds anywhere else in this country or in any other country, for the matter of that. The shooting public at once became interested in them, and thus several new entries were doubtless secured. The system of dividing the moneys which prevailed in 1896 was adopted again for 1897, the divisions, however, being graduated up to 150 entries in this year's programme. Although we had confidently expected that last year's big total would be exceeded, and had so stated in several of our recent issues, we were totally unprepared for such an enormous increase in the number of actual entries as is recorded on the cashier's book for 1897. This increase amounted to 37, an increase of just about 35 per cent.!

SOME COMPARATIVE FIGURES.

The great shoot promoted in August, 1896, by the Du Pont Powder Company at Watson's Park, Chicago, under the management of Mr. E. S. Rice, the company's general agent in the West, made a new ecord with a total of 125 entries. The Grand Prix at Monte Carlo his year also made a new record for itself with a total of 118 entries. From these figures, therefore, it will be seen that the Interstate Association can boast of having broken *all* records. In regard to the Grand Prix, however, it must not be overlooked that that event is 'all on the same mark," except in the case of previous winners, who are penalized 1yd., the winner in the previous year standing back an additional yard. The conditions also are 12 birds, $40 entrance—practically a $40 miss-and-out, with substantial money for the winner and a handsome trophy of silver. Hence it is perhaps unfair to compare the Grand American Handicap and the Grand Prix.

IRBY BENNETT.

Chairman Tournament and Classification Committee, Interstate Ass'n.

HOW THE SHOOT WAS RUN.

It may at first glance seem an easy matter to run a shoot when three sets of traps are provided, but when one comes down to figuring on it, it will be seen that there is far more in it than meets the eye. As a matter of fact the running of this year's Grand American must be looked upon as an experiment, and as such it was a big success. There was not a hitch in the whole affair, and everything ran with the smoothness of well-oiled clockwork. For that reason it is highly probable that Manager Shaner may not receive all the credit that is due him for his work in his double capacity of "engineer and oiler." Many hours of thought had necessarily been given to the running of the shoot; to all intents and purposes the Grand American Handicap of 1897 had been shot on paper time and again, and on paper the arrangements looked all right. An actual trial was needed to prove whether the calculations and preparations were correct or not. That trial has come and gone, and the result is a great triumph for Elmer E. Shaner. The 135 shooters were handled with ease, and the only delay was caused by the dilatoriness of the shooters in getting to the score. These delays were in many cases almost infinitesimal, but the number was sufficient to amount to many minutes during the day.

The claim was made in the programme that with a number of entries no larger than last year's list the Grand American Handicap could be decided in one day on the Elkwood Park grounds. Results show that this claim was well founded. Last year there were 104 shooters, this year there were 135; yet with this large increase in the number of shooters it was possible to get to the end of the 21st round in one day. Then again, instead of being able to start at 10 prompt, it was necessary to wait until the 8:30 train from New York city had arrived, or else run the risk of causing delay by having to shoot up some men after the affair had started Thus it was fully 10:20 before A. W. du Bray led off with the first kill in the Grand American of 1897. Later in the afternoon a squall of wind and rain made a further delay of at least ten minutes The slight rainfall at the start of the event in the morning also caused a certain amount of slackness on the part of some shooters in getting to the score. On Thursday morning it took just about forty-five minutes to finish the event down to the ties.

MONEYS DIVIDED AMONG THE TIES.

Hon. T. A. Marshall stood alone with 25 straight and took the first prize of $500 Nine tied on 24 out of 25 and divided the next nine moneys—$1,696.15—a total of $188.45 each. Eleven men tied for the next eleven moneys—$1,094.35—and divided without a shoot-off, each man receiving $99.50.

This disposed of twenty-one moneys and left the sum of $254 50 to be fought for by the "three miss men." Every man who had missed three birds on the previous day had to withdraw, with a privilege of re-entering provided he had a chance to win any of the money. Thus each of the 135 starters who had missed three birds—114 in all—were entitled to shoot up for the five moneys until they missed again; in the latter case they dropped out again. Several shooters were not on the ground, but there were enough to make the shoot-off a very long matter. It was a shoot-off, practically miss-and-out, with $254 at stake. Finally 13 men scored 22 and divided the purse, receiving $19.55 each.

It is safe to assert that with forty-five minutes more time on Wednesday the Handicap would have been finished; and it is highly probable that there would have been no shooting up of the "three miss men" had it been finished on one day. The strong northwest gale that swept over the grounds on Thursday morning caused havoc among the scores. Dr. Carver and H. C. Koegel, two straight men,

J. A. H. BRESSEL.

President of the Interstate Association.

both lost their 24th birds dead out of bounds, and both losses were directly attributable to the strong wind that carried the birds out of bounds. Misses came so fast in other places that there was soon no question about a shoot up of the "possible 22s."

ELMER SHANER AND HIS HELP.

In order to run the shoot successfully and smoothly Manager Shaner had a small army of help. The referees were: No. 1 set of traps, Harold Wallack, of Long Branch; No. 2 set, Ed Taylor, of Latlin & Rand Powder Co.; No. 3 set, Paul North, of the Cleveland Target Co. The official scorers were: No. 1 set, J. Vone Emmons, of Long Branch, N. J.; No. 2 set, J. K. Starr, of Philadelphia; No. 3 set, Howard W. Gray, of Brooklyn, N. Y. The cashier's office was capably officered by B. H. Norton, of the Hazard Powder Co., assisted by A. Meyerhoff, of Hartley & Graham. The duties of squad hustler and general utility man were handed over to Bill McCrickart, whose acquaintance with the shooters of this country is so wide that he is invaluable in such a position. His capacity for work has never yet been fathomed, and at the end of the three days he seemed as fresh as when he started on his arduous duties.

A new position, created by the peculiar conditions of three sets of traps and "three misses out," was that of "Compiler of Scores" (the title was manufactured by Elmer Shaner; we are not to blame). In order that the duties of this official (the trap editor of FOREST AND STREAM, by the way) may be the better understood, we shall have to still further explain the method of conducting

THE CLERICAL PART OF THE WORK.

All score pads were issued by and returned to the Compiler of Scores, who had for his assistant John D. Regan, of Brooklyn, whose quickness and accuracy were of the greatest assistance when it came down to getting out the score pads quickly. Under the "three sets of traps" system it was necessary to keep close tab on the scores, so that there might be no delay caused by calling up a man who had dropped out. To explain this difficulty better we would state that each man shot a bird at No. 1 set of traps, another bird at No. 2 set, and a third bird at No. 3 set. He then retired and waited until called up for his next series of 3 birds, to be shot at in similar order. Now, suppose that at the commencement of the 7th round a man had lost 3 birds, the scorers in their respective houses would not know of the fact, and would delay the game by calling him to the score. To obviate this delay, separate score sheets were provided for each round, and were returned to the office of Compiler of Scores as soon as completed. Each pad contained twenty-five names; thus, as there were over 125 shooters, six sets of these pads were needed, and were handled just as if they were squad pads at a target tournament.

As soon as each pad was returned Mr. Regan transferred the scores to a main score sheet and filed the originals for reference in case of dispute. When a man was found to have missed three birds his name was dropped from the score pad sent out to the scorers when it came time for that squad to shoot. This dispensed with all danger of delay so far as the scores at No 1 set of traps was concerned.

The next point to be covered was that of a man who had two misses to his credit when he went to the score at either No. 1 or No 2 sets of traps, and who might score his third miss at one or the other of these sets. This difficulty was satisfactorily overcome by stationing officials at the entrances to No. 1 and No. 2 sets, whose duty it was to ask each man who missed in the current round whether it was his third miss or not. If it happened to be the third miss a note was dispatched by this official per messenger boy to the scorer at either No. 2 or No. 3 set of traps, or both, as the case might be, directing him or them to cross the shooter's name from the score pad. These officials were: At No. 1 set, E. H. Taylor, son of Ed Taylor; at No. 2 set, Jerome Smith. Their respective messenger boys were: Firman Woolley and Arthur Hearne, boys who did their duty like little men. It is only just to the shooters themselves to state that their promptitude in answering the questions of these officials had much to do with the smoothness with which the shoot was run. Fred Tabor was the messenger attached to the office of Compiler of Scores; his duty was to take out fresh score pads and bring in the others as soon as they were completed. Thus the scoring department had quite a staff of helpers: Compiler of Scores and his assistant; three official scorers, two officials to watch the misses at Nos. 1 and 2 sets of traps, and three messengers; ten altogether. (If anybody will suggest a plan by which this number can be reduced Elmer Shaner will be delighted to hear of it.)

REBATE TICKETS AND ORDERS ON THE CASHIER.

In all the events on the programme it was a case of "birds extra." and "two" or "three misses out," as the case might be. Hence the same system of scoring as regards score pads was observed during the entire three days. When a shooter dropped out of an event he had to apply to the Compiler of Scores for a rebate ticket calling for the amount of cash due for birds not shot at; this ticket was redeemed at the cashier's office for cash or "no bird" tickets, at the holder's option. Orders on the cashier for each winner's share of the different purses were also issued from the office of the Compiler of Scores. All these small matters, while they simplified the running of the shoot, gave us lots of work to do and also gave us lots of pointers as to how that work could be cut down at future tournaments under similar conditions.

HOTELS TO ORDER IN SIX DAYS.

One of the greatest features about this year's Grand American Handicap was the annex with twenty rooms, added to the Elkwood Inn for the accommodation of those shooters who preferred to stop near the grounds to going into New York or being quartered a mile or two from the scene of the shoot. Accustomed as our Western brethren are to seeing towns spring up in a few days, they were rather astonished at finding that Messrs. Daly & Chanfrau, managers of the Elkwood Park grounds, were capable of building hotels to order in six days.

A little more than a week prior to the commencement of the shoot, Messrs. Daly & Chanfrau found that there was some difficulty in regard to adequate accommodation for shooters in the neighborhood. To obviate this an annex containing twenty rooms was planned, built and ready for occupation in six days from the time that the foundations were first started. Running water, lavatories, with the best of plumbing; electric lights in every room and hallways; electric buttons to call the bell boys or to send in a notice to the office that hot water, ice water or other liquids were needed, graced the walls of each room. It was, in short, a hotel built to order in less than a week! So much for Jersey enterprise.

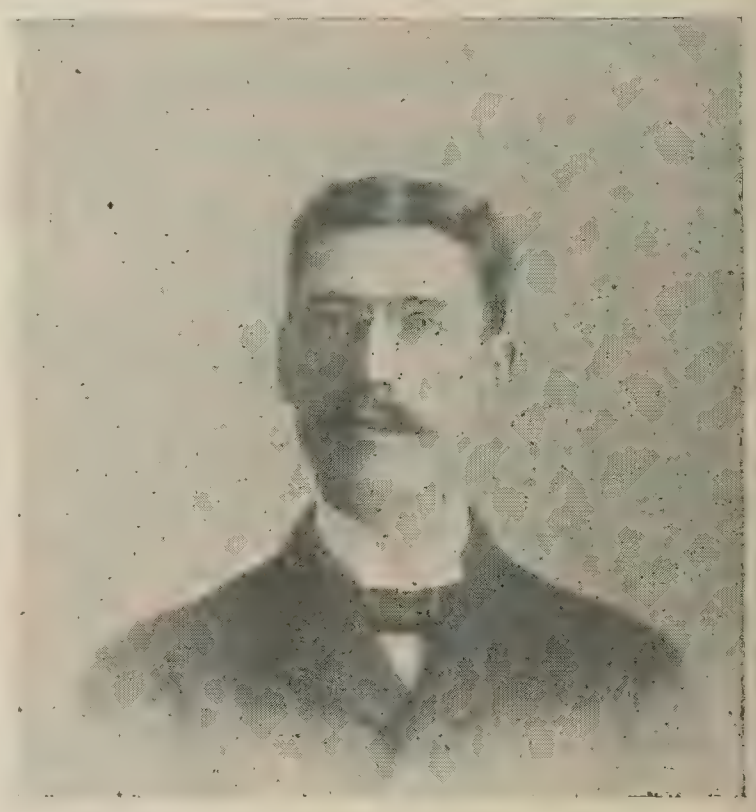
THE WESTERN CONTINGENT.

From Indiana, Illinois, Wisconsin and from Iowa came a group of shooters, every one of whom was well calculated to uphold the honor of his respective State. From Iowa came Charlie Budd, of Des Moines; Charlie Grimm, of Clear Lake, the holder of the cast iron championship; Fred Gilbert, of Spirit Lake, the ex-champion of the world at targets, and for about twelve months the holder of the Du Pont championship at live birds. There's a trio for you. Wisconsin was responsible for two shooters of far more than ordinary caliber: Dick Merrill and Dr. J. L. Williamson, both from Milwaukee. Indiana was worthily represented by Ed Voris, of Crawfordsville.

But to Illinois we must give the palm. Her representatives were ten in number. First and foremost comes Hon. Thos. A. Marshall, for the past twelve years mayor of his city—Keithsburg, Ill.—the winner of the Grand American Handicap of 1897, the only shooter to score within bounds the total of 25 straight. Dr. W. F. Carver comes next; he showed what he could do from the 33yds. mark by scoring 23 straight before losing a bird, his 24th falling dead out of bounds. (This item is referred to later.) The brothers, W. and H. Dunnell, from Nippersink; Eddie Bingham, formerly with Montgomery Ward & Co., but now with Mr. E. S. Rice in the employ of the Du Pont and Hazard powder companies; W. L. Shepard, of Chicago; W. D. Stannard, of Montgomery Ward & Co; J. Glover, of Chicago; C. M. Powers, of Decatur, one of the very best shots in a State that boasts a large number of crackerjacks; and E. S Rice himself, the leader of the Western contingent and general agent for the Du Pont and Hazard powder companies in the Western States.

BUT THERE WERE OTHERS.

Ohio was well represented. She could claim several of the shooters as her sons: Rolla O. Heikes, champion of the world at targets and holder of the E. C. Powder Co.'s championship cup; and E. D. Rike, also from Dayton; R. S. Waddell, the Du Pont and Hazard companies' general agent for the Central States, from Cincinnati; D. A. Upson, E. Dallas and C. T. Bodie, Cleveland; F. D. Alkire, Woodlyn.



Pennsylvania had more representatives than any o her State except perhaps New York or New Jersey, the city of Pittsburg being responsible for fourteen entries. The Herron Hill Gun Club sent a very strong delegation: Charlie Painter, president of the club, who shoots under the name of C. A. May; Alex. King and Will King. J. E. (Bessemer) England, B. F. (Fargo) Jones, C. S. (Strong) Guthrie, J. (Hamilton) Anderson, A. C. L. Hofmeister, J. G. Messner (winner of the Grand American Handicap in 1895), Sandy McPherson, Theodore Hostetter and the club's secretary, L. Lautenslager. Old Hoss, too, of the Pittsburg Gun Club, was another entry from Pittsburg.

It would be really impossible to go through the long list of entries and apportion each man to his own State without taking up too much of the space available for the description of the Grand American Handicap tournament. We must, however, not forget to mention that among those from a distance were: J. M. Browning, of Ogden, Utah; Jack Fanning, of San Francisco; Frank Parmelee and G. F. Brucker, of Omaha, Neb.; J. A. R. Elliott, Kansas City, Mo., and John J. Sumpter, Jr., the Arkansas Traveler of to-day.

With the explanation that runs at the beginning of the above paragraph we must tack on an apology for those not mentioned in the list. It is sufficient to say that never before in the history of this country, and maybe of any country, was such an aggregation of shooters gathered together under one roof as in the Elkwood Park Casino on Wednesday, March 24, the date of the Grand American Handicap of 1897.

THE APPOINTMENTS OF THE CLUB HOUSE.

If there is anything lacking to make the appointments of the Elkwood Park Casino absolutely perfect we have yet to learn of it. The

J. L. LEQUIN.

Secretary-Treasurer, Interstate Association.

number of shooters was far in excess of what the managers of the shooting grounds had figured on when drawing up plans for the club house, yet there was room for all. Rain or shine, the shoot went on just the same, except for a period of ten minutes or so on Wednesday afternoon, when a miniature waterspout burst over the grounds. Shooters rotated from No. 1 to No. 2 and on to No. 3 sets of traps without a stop. They were not bothered or hampered by a crowd at the score, while the underground system of trapping the birds made rapid shooting, particularly when there was a miss; the waiting shooter then had nothing to do except to step to the score and call "Pull." The trap was filled while he was putting shells in his gun.

The right wing of the Casino was reserved for shooters exclusively, the left wing was open to friends of the shooters and men waiting their turn at the score. The central hall was open to everybody, with the exception of the space reserved for the members of the press, the telegraph clerks, and the office of the Compiler of Scores. Upstairs was the café, where a hot lunch was served every day.

Outside the Casino there was no need for a shooter or a spectator to step off the board walks. It is an ideal shooting park, and we cannot see how the grounds and their appointments could be improved. There may be other places similar to Elkwood Park at some future date, but at present there is but one perfect shooting ground in the country.

THE BIRDS WERE EXCELLENT.

The pigeons were furnished and handled by Messrs Gilbert, of Philadelphia, and were of the very best class. The "culls" shot at on Tuesday were a fast lot, but the cream were reserved for the Grand American Handicap on Wednesday. Of course the wind helped them, but without a breath of air to start them we would guarantee a fast lot of birds anyhow. At times the wind rose to a gale, particularly on Thursday morning; then the birds were terrors. We cannot speak of them from any set of traps save No. 2, but we know that very many shooters have a great respect for the flying qualities of many a dozen birds that left the traps on the middle set of grounds.

The birds were trapped from the Mott disappearing traps, and there is no question but what these traps with fast birds are harder than any other set of traps under similar circumstances These traps and the automatic pulling apparatus worked like a charm all through the shoot.

THE BARRING OF J. L. BREWER.

The only unpleasant feature of the whole tournament was the necessity, as the Tournament Committee considered it, of barring J. L Brewer from competing at this tournament. It is conceded by almost all shooters, and we ourselves have often so stated it, that John L. Brewer is without a peer in the trap shooting world as a handler of a gun; and although we concur emphatically in indorsing

the action of the Tournament Committee, we regret most sincerely that cause for such action was found. It would, under any other circumstances, have been a positive pleasure to have seen the contest for supremacy between such giants as Brewer, Carver, Grimm and Elliott; that such a contest was not possible was most unfortunate. As the Interstate Association reserves the right in its programme (under the head of "Announcement," subhead "Information relating to the Grand American Handicap") to refuse any entry, we fail to see how any redress is obtainable. All talk about suing the Association seems childish indeed. The whole matter is a most regrettable incident, and is the only feature that mars the memory of a most enjoyable tournament.

First Day, March 23.

As stated in our special dispatch to Forest and Stream on the above date, which appeared in our last issue, the day was one of the few springlike ones that we have been favored with so far this year. Shooters were out in force early and a commencement was made promptly at 10 A. M.; the number of men stopping at the Inn and its "six-days old" annex, as well as those located at other hotels near the grounds, rendered it possible to make this early start. So rapidly were the rounds run off that even with the 70 entries in the

ELKWOOD PARK INTRODUCTORY,

the event which opened the ball, it was almost completed before the 9:10 train from New York arrived at the Branchport crossing. The conditions of this event were as follows: 7 birds, $5, birds extra, three high guns, *not class shooting*. These conditions made the event practically a miss-and-out when the capabilities of the contestants are taken into consideration. Of the 70 entries 29 killed straight and shot off, miss-and-out, for another series of three rounds, making it into a 10-bird event. At the end of the 10th round the 21 still straight agreed to divide the $350 in the purse. It will be noticed from the following score that out of the 21 straight scores of 10, 7 must be credited to the Iowa-Illinois-Wisconsin-Indiana delegation.

ELKWOOD PARK INTRODUCTORY.

The Elkwood Park Introductory had 70 entries. The conditions were: 7 birds, $5, birds extra, 30yds., 3 moneys, high guns. The 21 straight scores divided the purse of $350. The rule of "two misses out" soon cut down the list of shooters, as will be seen from the above score:

As soon as the 21 shooters mentioned above had agreed to divide, a start was made with the second event on the programme, the

NITRO POWDER HANDICAP.

This event had the enormous number of 110 entries, but so well did the birds fly, and so smoothly and rapidly did the shoot move along, that only 59 shooters were left in the race at the end of the 10th round, the conditions calling for those who had missed two birds to retire "with the privilege." Seven more retired in the next round, but only 1 dropped out in the 12th round. In the 13th round 4 more dropped out, and 5 in the 14th round. In the 15th round both Dick Merrill and C. W. Reed lost their birds dead out of bounds, spoiling their straights and dropping into the 14 hole. The purse was divided somewhat after the plan of the division of the moneys in the Grand American Handicap, as follows: 20 moneys, high guns, birds extra, 14, 12, 7, 6, 6, 5, 5, 4, 4, 4, 4, 3, 3, 3, 3, 2, 2, 2 and 2 per cent. As 18 men tied for first place, they agreed to divide the first 18 moneys, $1,056; this left $44 to be shot off for by the 25 men with 14 each. The shoot-off is shown in the score below, a decision not being arrived at until A. C. Monies, of Scranton, Pa., and J. M. Browning, of Ogden, Utah, had both killed 15 straight, in addition to their 14 out of 15 in the event itself. Handicap same as in the Grand American. Score:

Second Day, March 24.

This was the day set for the decision of the Grand American Handicap. No day could have dawned more inauspiciously. A strong, cold wind from the east, carrying any amount of wet with it, greeted the shooters when they came down to breakfast. Everything was water-soaked, and there seemed no ray of hope of its clearing up. The first thing to cheer the boys was a prophecy made by an old shellback, a native of the place, that it would clear up later in the day, adding to that statement that "there'd be plenty of wind too." At 8 o'clock rain came down in torrents, and for a few minutes everything was afloat. Then it cleared up a bit and some of the early birds made their way to the Casino. About 9:30 again it simply poured with rain; no other words can describe the heavy fall of water. Then it did begin to clear up for good, but a steady drizzle caused things to move slowly until about 11 A. M. Later in the day rain and a squall of wind played the mischief with straight scores and some of the "two miss" men, eventually putting a stop to shooting for about ten minutes.

With the wind coming out of the east, the No. 1 set of traps was nothing like the bugbear that Nos. 2 and 3 were. On No. 2 the wind blew strongly from left to right, while on No. 3 it was a straightaway. As the sun commenced to lower in the heavens the wind increased in force, and ciphers became more numerous toward the end of the day. During the series of the three rounds, 19, 20 and 21, several straight scores were spoiled, and Nos. 2 and 3 sets of traps were to blame. At the close of the day's shooting, the end of the 21st round, there were only three men out of the 135 starters who had straight scores to their credit. These three were Dr. W. F. Carver (32), Hon. T. A. Marshall (28) and Henry C. Koegel (27). Out of the 135 men who started in the race there were only thirty eligible to go on with the event on Thursday morning. As there were twenty-six moneys, it only required five to fall out in the last four rounds to let in all the "three-miss men." This fact was the subject of much discussion on Wednesday night at the Inn. The general feeling was that the "22 men" would have more than a show for some of the money, unless there was no wind on Thursday morning. This fear of there being no wind on the part of the "22 men" was put at rest by the generous way in which the wind veered from the southeast into the northwest early in the night, continuing to increase in force until a veritable gale greeted the boys as they came down to breakfast on the morning of the

Third Day, March 25.

The wind was freezing cold too. There was ice in the feel of it, and as a matter of fact there was ice on the ground. The men who did the most of the smiling were those who had been retired under the "three-misses-out" rule. They wished for a chance to shoot up, and they got their wish. Out of the thirty starters on this morning, nine fell out before the end of the 25th round. This let in the "three-miss" men, and a long shoot-off for the $250 that made up the last five moneys was the result. This shooting up put a stop to all idea of finishing the programme, but the Consolation Handicap, a 15-bird event, was decided. The Long Branch Scramble would also have stood some show of being shot off had it not been for the excellent quality of the birds. The "two-miss" men in the Consolation Handicap were retired as per rule, but misses were so common that when it came to the end of the 15th round there were not enough men left in to decide the ten moneys. This event is described later.

THE CLOSING ROUNDS OF THE MAIN EVENT.

Naturally the chief interest in the closing rounds of the Grand American Handicap centered in the shooting of Tom Marshall, Dr. Carver and Henry Koegel, the three straights. Dr. Carver successfully negotiated his 22d and 23d rounds at Nos. 1 and 2 sets of traps respectively. He then moved on to No. 3 set, and here the wind had full force, blowing right in from the traps, getting under the birds and lifting them back over the shooters' heads in a very puzzling manner. The crowd had followed the Doctor and watched him closely. A kill on these traps virtually meant a sure 25 straight, as the birds from No. 1 set of traps were nothing like as hard as those on the other sets. When he called "Pull," No 4 trap opened and a towering incomer left it. Dr. Carver held his fire a little too long and then missed his bird with the first, a lightning second that smothered the bird being too late; whirled along on the gale, the dead bird came like a bullet over the boundary and fell with a crash through the glass that incloses the right wing of the Casino. It was a dead bird, but dead out of bounds. Henry Koegel was the next man with a straight score to follow the Doctor. He drew a circling incomer from No. 2, and it also fell dead over the boundary. Tom Marshall got an incomer from No. 4 and he stopped it well. He thus entered the 25th round alone in first place. A left quartering driver from No. 5 was killed in the 25th round, and then the man from Keithsburg, Ill., was seized by the Arkansas Traveler, hoisted on his shoulders, and carried in triumph through the Casino. It was a most popular win, and not a single shooter begrudged the Mayor of Keithsburg his well-earned victory. We have heard more than once that Tom Marshall was lightly handicapped. As a member of the handicap committee, we can hardly be expected to coincide with that opinion. Mr. Marshall shot a great race and *it was his day*. (Note.—As a matter of interest, it is well to state that after his victory Mr. Marshall told us in course of conversation that he had not shot at a single live bird since the Du Pont tournament last August, and, as the boys say, "If Tom Marshall says so, it goes.")

Dr. Carver shot magnificently, from all accounts; his one mistake was his being a bit too careful on that 24th bird. In speaking about that lost bird, the Doctor said that he held his fire with the intention of making it score as a dead bird with his first barrel; his failure to do so was fatal, as there was no chance to get in a second.

Henry C. Koegel hails from Newark, N. J., and is one of the most popular members of the East Side Gun Club; we believe that he is the chief executive officer of that club. Mr. Koegel has never shot in any large event before; in fact, we cannot recollect having seen him shoot at more than 20 birds all told. He is a steady shot, using his first barrel with good judgment, while his second is on hand if he needs it.

We have told elsewhere how the moneys in this event were disposed of, and the scores that follow, giving trap, flight of each bird and result of each shot (so far at least as the most part of the contestants are concerned), tell the story more correctly than we from our position as Compiler of Scores could tell it. The "three sets of traps" idea has one drawback to it, a similar drawback to that which one encounters in a three-ring circus, viz.: that, locate yourself where you will, you'll not see more than one-third of what's going on.

Little items of interest are often worth volumes of descriptive matter, so we will only add that on Wednesday over 2,100 birds were trapped from the three sets of traps in less than seven hours, and that it took just about 2,456 birds to finish the whole event, including of course the shoot-up of the "twenty-two possibles" on Thursday morning.

GUNS, POWDERS AND SHELLS.

With a total of 136 shooters facing the traps, it is impossible to give the guns and loads of each individual. The following table, however, shows the gun, powder and shell used by each of twenty-one men who killed 23 or better:

	Gun.	Powder.	Shell.
Hon T A Marshall	Cashmore	Du Pont	Trap.
Dr W F Carver	Cashmore	Du Pont	Trap.
Dr J L Williamson	Cashmore	Du Pont	Trap.
F Van Dyke	Winchester	W-A	Leader.
Ed Voris	Smith	Hazard	Leader.
Geo Cubberly	Parker	Schultze	Smokeless.
J E Applegate	Francotte	Walsrode	U. M. C.
C F Arno	Lefever	Du Pont	Smokeless.
Hy C Koegel	Smith	W-A	Trap.
E C Burkhardt	Smith	Hazard	Trap.
C W Budd	Parker	Hazard	Smokeless.
R A Welch	Purdey	Schultze	Trap.
R R Merrill	Greener	Du Pont	Trap.
O R Dickey	Parker	E. C.	Rapid.
W S King	Scott	Du Pont	Trap.
W Dunnell	Greener	Hazard	Leader.
F D Alkire	Smith	Du Pont	Trap.
C Furgueson	Greener	Schultze	V. L. & D.
A L Ivins	Greener	Schultze	Trap.
Arkansas Traveler	Smith	Du Pont	Trap.
Dr G V Hudson	Smith	Hazard	Smokeless.

From the above list it will be seen that the Cashmore gun, a weapon that one sees but seldom here in the East, practically took the three first posts of honor; Tom Marshall shot it into first place with 25 straight; Dr. Carver was at 32yds.; while Dr. Williamson was the only 30yd. man to score 24, and therefore naturally takes precedence on the muster roll of those who stood nearer to the traps than he did, and who scored a similar total.

Lumping other statistics together, we find that out of 134 guns shot by the 136 shooters there were: 32 L. C. Smiths, 29 Parkers, 26 Greeners, 13 Francottes, 9 Scotts, 8 Winchesters, 7 Cashmores, 5 Purdeys, 3 Lefevers, 1 Hollenbeck and 1 Baker.

In the matter of powders we can only give those used of 133 shooters, three others not wishing their loads to be known. Among the 133 were 33 who used E. C. Powder, and 33 who used Schultze; Du Pont comes next with 29, and Hazard follows with 12; 7 used Walsrode, 4 used W-A, and a like number used King's Smokeless; 3 shot Austin and two Gold Dust. In addition to the above, there were the following combinations: 2 Du Pont and Hazard, 1 E. C. and Du Pont, 1 Schultze and E. C., 1 Schultze and Du Pont.

As regards shells, the U. M. C. Company was easily first with 97 men who shot either Trap, V. L. & D. Special, Smokeless or Acme; the W. R. A. Company is credited with 24 names of men who shot their Leader shell, 6 men shot U. M. C. and W. R. A. shells combined; 2 men shot Peters's Victor; 2 others shot the U. S. C. Company's Rapid, another man shooting the same company's Climax.

THE GRAND AMERICAN HANDICAP.

Twenty-five birds, $25 entrance, birds extra, not class shooting, handicaps 25 to 33yds. rise, $1,000 guaranteed by the Interstate Association, and all surplus added: $500 to first high gun, $300 to second high gun and $200 to third high gun; all money in the purse in excess of the $1,000 will be divided in accordance with the number of entries received:

THE CONSOLATION HANDICAP.

This event was started as soon as the Grand American Handicap had closed. It had 48 entries at $10, birds extra. So fast were the birds, owing both to their excellent quality and the strong gale of wind, that misses came all too rapidly. Squad pads that started out with 25 names on one and 23 on another soon dwindled down to a mere 15 or 20 all told, and it was soon seen that there was danger of another shoot-up on the part of the two-miss men. In the very last round this thing happened, only 9 men being left in for the 10 moneys. There were only four straights—Gilbert, Grimm, H. Dunnell and A. L. Ivins; these four divided $312. The other five men with 14 apiece divided the next five moneys, amounting altogether to $153.60. This left the small sum of $14.40 to be shot off for by the two-miss men, 39 in all. Several of these refused to shoot off, preferring to wait and try their hands in the Long Branch Scramble. The shoot-off was commenced on No. 1 set of traps, but everybody seemed to be killing their birds, so a move was made for No. 2 set. Here misses were more numerous, but still it was a long drawn out affair. Finally it got down to Chan Powers and the Arkansas Traveler, Powers ultimately shooting out the Arkansan. During this shoot-off some great shots were made, the affair on the No. 2 set creating more amusement than all the rest of the shoot put together.

Before the Consolation Handicap was quite finished, it was evident that there would be no chance to shoot the Long Branch Scramble, Accordingly Manager Shaner directed those who had entered for this event to draw down their money and close up their accounts at the cashier's office.

The tournament of 1897 closed about 6 P. M., after a most successful three days' shoot. The score of the Consolation Handicap follows:

PUBLISHERS' DEPARTMENT.

L. W. Ferdinand & Co.

WE take the following from an exchange:

The demolishing of buildings to make way for the new terminal station in Boston has caused many old established business houses to locate elswhere. The building at 267 Federal street has been the home of L. W. Ferdinand & Co. for more than a quarter of a century, and they have built up a large trade in yachting hardware, boat fittings, paints and oils. This was one of the buildings that stood in the way of the new station, and they were obliged to seek other quarters. They are now located at the corner of Federal and Purchase streets, and 176 to 184 Federal street. The new store is as large again as their old store, and is light, airy and easy of access, offering every opportunity to show their large stock of goods to the best possible advantage. It is the intention of L. W. Ferdinand & Co. to carry a full line of builders' hardware in connection with their regular stock, and they also occupy two floors at 220 Purchase street with a complete line of boats oars etc.—*Adv.*

Prizes for two Inventors.

FOR some time the patent firm of John Wedderburn & Co., of Washington, D. C., have given a monthly reward of $150 to the inventor who should submit the best invention from the standpoint of simplicity, novelty and utility. The Board of Awards, composed of Senator Wm. Stewart, of Nevada, Chairman; Representative Claude A. Swanson, of Virginia; Mr. John C. Eckloff, cashier of the Second National Bank of Washington; and Messrs. A. C. Moses, of W. B. Moses's Sons, and F. E. Woodward, of Woodward & Lothrop, two of the leading merchants of the capital city, has just selected the prize winners in the contest participated in by inventors who submitted their devices during the month of January. The prize of $150 goes to Wm. Taylor, of Kearney, N. J., the inventor of a bicycle brake of simple construction; and the gold medal to Theodore G. Thomas, of Lamarque, Texas, for a monkey wrench of novel design.—*Adv.*

Bronze, Brass and Aluminum Castings.

THE Andrew B. Hendryx Company, 18-24 Audubon street, New Haven, Conn., makers of the famous Hendryx reels, announce that, having added a complete bronze and brass foundry to their Audubon street works, and purchased the foundry and good will of Messrs. Henry E. Preiss & Son, of New Haven (employing both members of the late firm), they are prepared to supply bronze, brass, aluminum and white metal castings promptly and of uniformly good quality.

They are also prepared to design new styles and patterns for the special use of customers at reasonable cost, and solicit the opportunity to quote prices on receipt of sample castings or patterns.

Yachtsmen and sporting goods manufacturers in need of such work would do well to address the Hendryx Company.—*Adv.*

Metal Boats.

W. H. MULLINS, of 16 Depot street, Salem, O., announces that he has just completed designs for an embossed metal dinghy, or yacht tender, which he feels sure will be very taking with yachtsmen generally. The model of the boat is perfect and the workmanship unsurpassed. At present they will be made in galvanized steel, manganese bronze and aluminum. The bronze and aluminum boats are the most magnificent boats of the kind manufactured, and Mr. Mullins feels confident that the wealthy class of yachtsmen, who are always on the lookout for the very best, will appreciate the style and finish.—*Adv.*

A New Yacht Water Closet.

ALFRED B. SANDS & SON, 134 Beekman street, New York, manufacturers of folding lavatories and yacht closets, have ready for the market a greatly improved water closet operated by electricity and flushed by turning a switch. In this closet, as with others manufactured by this firm, there is no danger of flooding, though placed below the waterline. The arrangement is very neat and compact, and in some models may be placed in a locker or transom entirely hidden away from view.—*Adv.*

"Baker Gun Quarterly."

THE March issue of the "Baker Gun Quarterly" has a leading article on pigeon farms, where birds for shooting contests are reared, and also gives particulars of the new Baker hammer gun, model of 1897, and the new Batavia hammerless. The "Quarterly" will be sent, free of charge, to any one who makes application.—*Adv.*

Steam and Gasoline Launches.

MESSRS. MURRAY & TREGUTHA, West First street, foot of E street, South Boston, Mass., manufacture steam and gasoline, as well as single, compound, triple and quadruple expansion marine engines. Their specialties are perhaps the Tregurtha safety water tube boilers and gasoline engines. They have just issued a new circular of launches and engines.—*Adv.*

The Parker Calendar.

PARKER BROS., Meriden, Conn., have recently published a handsome calendar for the year from March, 1897, to March, 1898, illustrated by portraits of prominent trap shooters. These calendars will be sent free of charge to gun club secretaries, or to others on receipt of 10 cents for postage.—*Adv.*

Stevens Rifles and Pistols.

THE J. Stevens Arms and Tool Co., Chicopee Falls, Mass., issue a reduced price list for 1897. The Stevens Company have reason to feel pleased with the success of their rifle at the Sportsmen's Exposition, as wins in three out of five contests were placed to its credit.—*Adv.*

"Sunset Limited."

THE Southern Pacific R. R. announces that the "Sunset Limited," between New Orleans and Los Angeles and San Francisco, has been withdrawn for the season. The last train from New Orleans left April 1.—*Adv.*

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, APRIL 10, 1897.

VOL. XLVIII.—No. 15. No. 346 BROADWAY, NEW YORK.

For Prospectus and Advertising Rates see Page iii.

My dog Bowie-knife thinks that the world is full of b'ar, he finds them so easy. I never could tell whether he was made expressly to hunt b'ar, or whether b'ar was made expressly for him to hunt; anyway, I believe they were ordained to go together as naturally as Squire Jones says a man and woman is, when he moralizes in marrying a couple. In fact, Jones once said, said he: "Marriage according to law is a civil contract of divine origin; it's common to all countries as well as Arkansaw, and people take to it as naturally as Tim Doggett's Bowie-knife takes to b'ar.

Big Bear of Arkansas.

THE FOREST RESERVES.

WE publish on another page a letter from Governor Richards, of Wyoming, with reference to the forest reserves. Governor Richards tells us that we were in error when we said the other day that no mining operations or other enterprises had been interfered with by the setting apart of the reservations heretofore made, and he cites certain instances where such interference has operated to the detriment of interests in his own State. The statement to which he alludes was based in general on the absence of any specific warrant for such interference in the forest reserve law of March 5, 1891. But more particularly it was based upon what had been communicated to us with respect to some of the very cases cited by Governor Richards. For instance, we had been informed upon what was assumed to be adequate authority that the miners and ranchmen in the Sunlight Basin had some time ago been advised by the Interior Department that their operations would not be interfered with; and it was upon such information that our comments were founded.

The hardships caused by the establishment of the forest reserves arise from an interference with certain enterprises, which is purely temporary. The setting aside of these tracts implies no forfeiture of any rights, whether already acquired or in process of establishment. Such temporary hardships must be balanced against the unquestioned vast benefits to be conferred on the whole West by an adequate system of forest preservation. The forest reservations are established not for the advantage of any class, but for the benefit of every community, wherever it may be located. If the acquirement of a title, to his claim by a settler is put off for a time, yet that title when he gets it, is worth to him far more under a law which provides forest protection than if no such protection existed.

If a law providing for surveys and an adequate forest preserve system could have been had, it might have been better to have made the surveys before establishing the reservations, but the entire disregard of the subject by Congress in the past justifies the belief that many years might elapse before the money for such survey would be appropriated, and in the meantime the forests would be disappearing, the little streams on which the ranchman in the dry West depends for his hay, and his garden would grow smaller and smaller, while the floods which threaten the fertile valleys of Pacific coast rivers would become more and more a menace.

We join with Gov. Richards in his condemnation of the inadequacy of the National forestry laws and in his protest against their inefficiency. Congress should have enacted years ago forest laws, under the operation of which the setting aside of a forest reservation would involve injury to no one's interests. Whatever of hardship may have been inflicted in Wyoming has been the result of this indifference and inaction on the part of Congress, and is not a legitimate fruit of the forest reserve policy, nor could it continue after the embodying of that policy in a law by Congress. The policy was well outlined by the Forestry Commission in their report last February to the Secretary of the Interior, in which they said:

"The Commission fully recognized the fact that the forest reserves established and proposed cannot be maintained unless a plan can be adopted under which their boundaries can be modified so as to take from them all lands better suited for agriculture than for the production of forests, and under which their timber can be made available for domestic and commercial purposes, and valuable mineral freely sought for and mined within their boundaries."

The Commission has been continuously at work on such a plan as was here contemplated; it is very shortly to be submitted to the executive, and we have urged the public to await the publication of this report and to take it into consideration before making final estimate of the wisdom of the reservations. If the amendment, which at this writing is pending in Congress, to authorize immediate survey of the tracts set apart, shall become a law, President McKinley will have it within his power to modify the present boundaries precisely in the way originally contemplated by the Forestry Commission and set forth in its recommendations as quoted above.

We do not, as Gov. Richards intimates, imagine that the people of the West are ill balanced. Human nature, nevertheless, is human nature, whether west of the Missouri River or east of it; the people of the two sections, it may be assumed, would act very much alike under like conditions, and the Portland *Oregonian* was no doubt right in its editorial expression of March 26 when it said:

"We have illustration here in the Northwest to-day of the spirit with which protective forestry measures would have been received in the Allegheny and Tennessee mountains 100 years ago. Temporary self-interest, real or fancied, frets at restrictive measures for permanent benefit, just as juries find not guilty the game law violator, though caught red-handed at his slaughter. The lowlands along the Willamette and Columbia may some day witness a repetition of these Mississippi horrors, if all efforts to protect the forests of the Cascade Mountains are rendered ineffective."

This attitude of the *Oregonian* toward the forest reserves, by the way, does not go to support the contention elaborated at such length by our correspondent who writes from Everett, Washington, that the forest reservation policy is an imposition put upon the West by the machinations of the effete East. Portland, Ore., is so far removed from Portland, Me., as reasonably to be credited with freedom from the tincture of Down-East prejudice; it out-wests Everett itself on the map, and yet the *Oregonian* stands for the reservations as planned by the Commission. In this, as in so many other interests, we believe that our Oregon contemporary represents the intelligent public opinion of the Pacific coast; and we refuse to accept as reflecting the real sentiment of the West Cayuga's argument of sectionalism, provincial conspiracy and geographical enmity. Those who are laboring for the perpetuation of the forest resources of the great watersheds of the Northwest are impelled by an enlightened patriotism which knows no East as opposed in interest to the West, nor any West whose true interests are not the true interests also of the East and of the entire country.

NEW YORK ZOOLOGICAL SOCIETY.

ON March 24 a hearing was given by the Sinking Fund Commissioners of New York city to the executive committee of the New York Zoölogical Society. At the close of this hearing, the Mayor and the other Sinking Fund Commissioners, by a unanimous vote, approved a resolution allotting to use of the Zoölogical Society a tract of about 261 acres, comprising South Bronx Park. This allotment was made on condition that within three years the Society shall raise $250,000, from which it shall furnish building and collections for the Zoölogical Park. The grounds shall be prepared by the Park Commissioners of the city, and the city shall bear the expense of maintaining the park and its collections. The buildings erected by the Society will become the property of the city, but the collections will be held by the Society; but it is understood that these collections shall not be moved or mortgaged except in the event of the failure of the city to provide funds for their maintenance.

A bill has been introduced in the New York Legislature to provide $150,000 for ground improvements, prior to the erection of buildings by the Society. There seems to be no opposition to this bill, and it is hoped that within a short time it will become a law. So soon as this money shall have been appropriated, the Park Department will begin the work of preparing the ground for the uses of the Society.

The sum required to comply with the city's conditions is a large one, yet it cannot be doubted that among New York's citizens there are many who will be glad to contribute liberally to an object which promises to do so much for the classes whose pleasures are few and whose horizon is limited. The fact that the Society's collections will be open to the public for at least five days in each week, and always on Sundays and holidays, will make the Zoölogical Park a boon and a blessing to the poor, and in itself is a strong appeal for liberal donations from those who are able to give.

Among the readers of the FOREST AND STREAM there is a very large number who are interested in natural history, or in wild animals or in living things in general, and all such may be expected to feel an especial interest in the projected park. The Zoölogical Society will soon be making an effort not only to secure generous subscriptions toward the sum required to fulfill the city's conditions, but also to secure annual members, whose dues of $10 a year will go a long way toward paying the current expenses of the Society. It is to be hoped that among the future members of the New York Zoölogical Society there will be many readers of FOREST AND STREAM.

Great credit is due to the executive committee of the New York Zoölogical Society, and especially to Prof Henry F. Osborn, its chairman, for the energy with which the work of pushing the young Society has been carried on, and the great success that is attending it. Unless unforeseen obstacles shall present themselves, the prospects seem bright for an early beginning of this important work.

SNAP SHOTS.

A novel feature of game legislation is contained in a bill now before the Minnesota Legislature with reference to the possession of game in close season. Under its terms when a person has killed or purchased game he will be able to keep it indefinitely, subject to certain restrictions. These are that he must notify the Game and Fish Commissioners of his possession of the game and obtain from them tags to be affixed to each quadruped or bird, and must sign a bond that the game so tagged will be devoted to his own use and will not be sold nor transferred to others. The game which may be possessed under this rule will be limited to one caribou, one moose, five deer and 100 birds. The purpose of the concession is to disarm that criticism of the game laws which finds its reason in dissatisfaction with the clause forbidding the possession of game for more than five days after the close of the open shooting season. If the new system can be conducted in such a way that evasion will be made difficult, the change cannot help being an advantage by enlisting the sympathy of a large number of people who are now opposed to protection.

In Germany they have just been celebrating the 100th anniversary of the death of that noted author, Baron Hieronymus Karl Friedrich von Münchhausen. Münchhausen was a Hanoverian nobleman, who was born in 1720 and died in 1797. He was notorious for the magnificent lies he used to tell about his exploits as a sportsman and on the field of battle. The collection of stories attributed to him was published in Germany during his life, and the English version was an expansion of the original. As for Münchhausen, it may be said that he has left his enduring mark upon posterity as a colossal liar.

We said the other day that the principle of game laws did not involve an unwarranted abrogation of personal and individual rights. Our Pennsylvania correspondent appears to have misconstrued our remarks. When we compared game shooting restrictions with laws which apply to the possession of diseased cattle, and the conversion of rye, corn and potatoes into whisky, it was not to class game in the category with these articles, as being subject to legislation for the same reasons which prompted the laws with respect to them. We cited them only to illustrate the fact that as to varied classes of possessions the citizen had not absolute right to do as he pleases, irrespective of the community. The reason that the sale of game is forbidden, or that game may be taken only within certain seasons, lies in the fact that experience has shown to the community that such regulations are for the public good. To make and enforce game laws, then, is not unjustifiably to infringe any individual rights which one may fancy he has in these matters. The game laws belong with the laws regulating cattle, crops, houses, and various other articles and activities, as coming within the police power of the State, which in a word means its power to regulate the conduct of man in a civilized community, so that he may enjoy his own without detracting from the enjoyment of their own by his fellows. Thus, if in Pennsylvania experience has shown that it is against the interest of the greatest number that game should be snared, or that game should be made an article of sale, it is within the police power of the State to forbid snaring and to forbid sale; and against the operation of such a law no claim of individual right and privilege can be held to prevail.

The Sportsman Tourist.

TALES TOLD BY THE CAMP-FIRE.—III.

BY AMATEUR.

(Continued from page 262.)

THE next night one of our number said: "Boys, I feel moved by the story told last night to give you another tale of some of the men named.

"Old Nosey was a medicine man of his tribe, most of whom were carried off by smallpox, and the survivors united with another tribe of the same blood, by which they lost their tribal name and became consolidated and commingled with that into which they entered. Nosey lost his standing as a medicine man, or would have done so had he gone into the larger tribe, whose medicine men remained the medicine men of the consolidated tribes, and Nosey would have been simply an old brave. There were only about twenty or thirty braves of Nosey's tribe left to enter the kindred tribe, besides some squaws and children. Nosey's pride forbade his giving up the position of medicine man, and having no kindred he came from what is now West Virginia down into Pennsylvania, into Greene county, and lived there as a privileged character among the whites for some twenty years or more. I have seen his grave and the tombstone erected by our friend's grandfather to his memory. Nosey was a powerful man among the Indians down to his death and a man of great intelligence, and in his way a man of learning. The token of his tribe was the bear, and the token of the tribe into which his remnant were adopted was the raccoon. His influence was always exerted for peace on the part of the Indians in their dealings with the whites. I had occasion to look all this up several years ago.

"The Engles were Germans, or Dutchmen, I think, perhaps from Holland. There were several Ezra Engles. Old Ezra Engle settled near where Wheeling, W. Va., is now, and was a gunsmith there; he settled there very early, I'm not sure of the year. His son Ezra was a gunsmith also, and went up the Ohio River and settled near where Pittsburg now is. These Engles all named their first-born sons Ezra and taught them the trade. Old Ezra, or Ezra I. (for he is the first of whom we have any knowledge), was a man at least thirty, maybe forty, years old when he settled near Wheeling. Ezra II., who settled near Pittsburg, was a man grown, and had a son Ezra, a gunsmith, of course; he was Ezra III. and came into Greene county, Pa., as it is now, and settled, teaching his son, Ezra IV., the trade, and Ezra IV. is he of whom we heard last night. Ezra IV. had a brother, Barnes, to whom he himself taught the trade, because he had no child until late in life, and he violated the family tradition by giving the trade to his brother.

"The Engles all manufactured their own gun barrels, bored them and rifled them, and each had his own particular place to mark his initials. Ezra I. put his initials on the end of the barrel, the flat end just over the bullet hole. Ezra II. marked his barrels just in front of the fore sight toward the muzzle. Ezra III. marked his barrels just in front of the hind sight, and Ezra IV. marked his just behind the hind sight, while Barnes Engles's barrels are always marked on the side, so that a portion of the letters B. E. in script is covered by the stock, and the point between the letters is always exactly under the hind sight.

"Ezra IV. made a trigger action for his guns different from any that I have ever seen; he was the only one of the Engles that used it, and seems to have invented it. As our friend said last night, by means of a screw it can be set for a very heavy trigger pull or to go at a touch.

"Engle guns may be found scattered through Greene, Fayette and Washington counties in Pennsylvania, and in the counties of West Virginia which border on the Pennsylvania line, and their maker can always be known by the position of the initial, as I have given it. These old guns have nearly always been changed to percussion locks.

"The Engles each had a different system of rifling their gun barrels. Ezra I. thought that no gun shot so well as one with only two grooves, and they very deep. Ezra II. was of the same opinion, but made the twist of his guns the reverse of the usual direction. Ezra III. used six grooves, while Ezra IV. thought no gun shot so well as one with four grooves, very deep, reverse twist, and one complete turn in a 3ft. barrel; but most of his guns that I have seen have eight grooves, a reverse twist, and a full turn in 3ft. Ezra IV. claimed to know how to make a rifle, as he said, 'self-cleaning,' that is that never required cleaning, and there was a peculiarity in this respect about his guns. I have seen them that loaded as easily after the one hundredth shot as after the first. His locks always had steel pans, and he possessed a method whereby he entirely prevented burning out at the breech, and enlargement of the touch hole through long use. No man ever saw a gun made by Ezra Engle IV. with a bushed touch-hole or an enlarged breech.

"Barnes Engle believed that the more grooves there are in a rifle the better. He also claimed to be able to make a self-cleaner sometimes, but not at will. He believed in the gain or increase twist reversed. I have seen rifles made by him with twelve grooves, and they were great shooters. Barnes Engle followed his brother Ezra IV. in this that he used a copper fore sight, and set it into the barrel tight and fast, without any base.*

"Ezra Engle IV. married Charity, the sister of our friend's grandfather, and Ben Wood married Patience, another sister; while Isaiah Jones, the powder-maker, married Bathsheba, a third sister. When Ben Wood and Patience were married, Ezra Engle IV. brought a very handsome new silver-mounted rifle to the wedding, and gave it to Wood as a present. The gun in that day was no doubt worth at least $75. When Engle offered the gun to Wood old Nosey was in the room, and came hastily up and said:

"'Ben no take um. Gun much heap bad medicine. Ben have bad luck, all heap bad luck. White squaw bad luck. White squaw no let Ben take um gun.'

"Ben Wood, however, accepted the gun, and the occurrence was forgotten. They lived together, Wood and his wife, for several years, but had no child. One day Wood came in and took up the gun, saying a turkey was gobbling in the woods and he was going out to shoot it. He went, but soon returned, saying something was wrong with his gun; that it had flashed in the pan every time, and he had failed to get the turkey. He was about to unbreech his gun when Patience said, 'You'd better take the gun over to Ezra, and get him to see what ails it.'

THE HOUSE BY THE LAKE.

"This was three or four miles, however, and Wood said he could look after it himself. He unbreeched the gun and took out some loose powder, and then tried to drive the bullet out, but could not move it. Then he put the breech into the bright wood embers on the hearth, with the intention of melting out the bullet, though Patience told him he would likely ruin the barrel. After the gun had been in the fire a short time he took it out and held it up to look at the barrel, when just as he had got it in position a report came, and Ben Wood fell back in his chair with a bullet in his brain through his right eye. Our friend's relatives, who lived near, came hurrying in, and found Patience in convulsions and Wood sitting dead in the chair. Her brother Een and Ezra Engle both examined the gun and said there had been two loads in it, and the bullet of the first load had acted as a breech pin and enabled the discharge of the second load. Patience recovered sufficiently to tell them what had occurred, but became worse and died that same night, and she and her husband, with their prematurely born baby, were buried in the same grave.

"Old Nosey came to the house the day after Patience died, and asked to see their bodies. After looking at them awhile he said: 'Poor Ben! Poor white squaw! No do what Nosey tell um; think Nosey, ole Injun, know nothin' when he say, "Gun bad medicine. No take um."'

"Our friend's grandfather was standing by and said: 'Nosey, you were right. The gun was bad medicine. What must be done with it?'

"Nosey replied: 'Put um on stock, all together, and put gun and powder horn and bullet pouch, all just as he am, in same box with Ben, at him right side, with muzzle of gun toward Ben's feet, and gun cocked, an' put um all in ground together, an' leave um there. Gun much heap bad medicine, but you do um so as old Nosey say. Bad medicine no kin hurt. You not do um so, gun kill some more, and kill um till he put in ground as old Nosey say.'

"There was a consultation among the members of the family, and the gun was buried as old Nosey had directed.

"Some time after this Ezra Engle IV. sold out, and went to Missouri some time after 1815 and settled at what is now, and I believe then was, Cape Girardeau. He had no children until late in life, when a son was born, whom he named Ezra, and taught his own trade. I saw Ezra Engle V. at his home in Cape Girardeau, and from him I learned these particulars and many more. He has put out many fine guns, and, like all the family, has notions of his own. He uses the peculiar action of trigger that his father invented, and copper front sights. He believes that for a rifle that runs 100 round bullets to the pound the barrel should be exactly 3ft. long inside; for larger balls shorter, and for smaller balls longer. He also claims to be able to make a self-cleaning gun at will, and believes in using the hardest steel barrels obtainable. Another of his notions is a three-groove gun, and he thinks the grooves should be shaped like a V, the wide part at the bore, and running to a point, in any rifle. He told me, however, that he usually turns out four-groove guns with gain twist reversed."

* Barnes Engle died between 1880 and 1890.—WRITER'S NOTE.

THE HOUSE BY THE LAKE.

WHEN the leaves turn brown and the gusty wind sends them whirling to form at last a noisy carpet for the frozen earth, memory takes wing and flies away to a clime where winter is a glorious reality, a stanch friend of no uncertain disposition. My brethren of the sunny South, my friends of the treeless prairies, did you ever follow a deer track through 6in. of snow amid the music of the pines? Let me show you a few pictures from the gallery of my recollection, pictures which will ever grow brighter and more distinct as time swings on.

In the far-away woods of the Northern State which was my boyhood home there was and yet is a great rambling house, half log, half frame, on the shore of a lake in a valley among the hills.

Those who have sat by the great fireplace will never, so long as life lasts, forget the hospitality and cheer that were warmer than the glowing fire. They will remember the hearty tenor voice, now still in death, which used to sing:

"And there I'm gwine to live and die,
In the little log cabin in the dell."

Perhaps, late in the evening, the poultry in the barricaded hen house would set up a tremendous cackling—evidence that Mr. Fox, the sneak, was trying to find a breech in the palisade which protected the chickens. Then the lop-eared hound would go to the door and whine, eager to take part in the disturbance. But we all knew that the wooden ramparts were secure.

The nearest other house was twelve miles away, but from the very door, looking out on the borders of the lake, I have counted the snowy tops of more than 100 muskrat habitations, where, snug and cosy, the little animals defied the storm and cold.

It seems to me that every right-minded man would prefer to have a muskrat city to look at than to own a hundred town houses.

And then besides that, there were the ducks that used to come in hundreds to feed on the wild rice at the far end of the lake, two miles from the house. Oh, but wasn't it fun to hide in the rushes and fool 'em with five or six wooden ducks that had their bills knocked off and one without any head because the horse had stepped on it one day.

Back from the lake half a mile was the eagle's nest, pretty nearly as big as a grocer's wagon and getting bigger every year. It used to seem wonderful how those birds could drag up the big sticks they put into the nest.

Sometimes at night two or three wolves would get together on the other side of the lake and howl. Do you think the effect of a wolf chorus is depressing? Now let me tell you that since then I have heard about all the finest music there is, and music is a lovely thing—the sweetest intangible thing on earth. But if I were compelled to choose between chances—if it was one thing or the other—and I could only have the one, knowing what I do now, I should say "good-by to the Kneisel quartet, the Boston symphony orchestra, Ysaye, Paderewski and all the rest of them; let me go back to that farmhouse among those wild hills; and when I step to the door on a moonlit night to get a drink of water out of the tin dipper from the bucket on the shelf outside the doorway, let me hear again floating across the still lake through the frosty air the friendly voices of the wolves."

It makes me laugh now to remember how those forest vagabonds would shut up their jaws and "make their sneak" when the farm dogs would tune up in reply. The dogs knew enough to let the wolves alone, though, generally. The Northern timber wolf, who looked about 4ft. high—as I remember him—was a bad man for a dog to tackle generally.

But perhaps you think there wasn't any other fun in that country besides the music! That is where you are mistaken. I'll tell you a few.

In the stream fed by the lake was an old dam—built years before by the lumbermen—and the vicinity of that dam was the scene of many joyous memories, winter and summer. In the spring the big pool below was full of

A MUSKRAT HOUSE.

trout. If you have caught trout you know all about it, and if you haven't it is no use to talk to you on the subject. And up above the dam was a place where the deer crossed pretty often. Such a country for deer! Out by the side of the house was a tall rack, where the deer often got hung up in the fall; not a straggling one or two, but fifteen or twenty in a season, and there were so many more in the woods that it didn't make any difference in the number. I remember one old buck that weighed 307lbs. He is conspicuous in the center of the picture.

Sometimes a black, glossy-coated bear, with crafty little eyes and short legs dangled ignominiously from this gallows, high out of the reach of harm from the dogs and other prowlers less domestic.

But, as I was saying, did you ever track a deer through 6in. of snow? In the early morning, after forcing yourself out of a warm bed on to the remarkably cold, bare floor; hastily dressing, with chattering teeth, and swallowing a cup of hot coffee, impatient of breakfast, you started for the neighboring hills. First would appear in the path ahead the track of the early rising fox, and his search for breakfast was plainly recorded in each place where he had turned aside to nose the track of mouse or red squirrel. In less than a quarter of a mile the tracks lengthened out into long, galloping leaps, showing where he had first heard your approach, stopped to listen, and then humped himself to get out of that. Not forty rods further was the faint

THE EAGLE'S NEST.

streak in the snow, recognizable 100yds. away, where two big fawns had leisurely dawdled up the hillside. Over the ridge the direction of the tracks showed their destination to be a brushy spot at the head of the little valley. A long circuit, a careful approach from the other side, and the first thing you knew you were almost on to them, and there they were, scudding through the brush in two different directions. Bang! bang! bang! how a repeater does just work itself without your knowing that you touch your lever! As you anxiously watched the result of the rapid fusillade, almost as if it was some other man who held the rifle, suddenly you saw a hindleg fly out helpless. Over the fallen logs you jumped, regardless of torn clothes and scratched wrists. There was the poor deer floundering in the brush, and a shot put an end to its misery. All before 8 o'clock in the morning.

Amid such scenes as those, what though you were forty miles from town? What though the roads were poor, and neighbors far away? I suppose, though, that in order to properly appreciate such a heaven upon earth it is necessary that a man should first pass a few anxious years amid the horrid sights and sounds of pestiferous brick walls. Then he can justly sympathize with those men of a former century who, after youth spent in European courts and castles, were happy to exchange the carpet and chandelier for the canoe and camp-fire, and to spend their remaining years among the friendly environments of the forest. To some men this would be a dreary place if it were all sidewalks and cultivated farms. A continent is getting pretty crowded when more than half of it is settled.

The house by the lake still stands; and, as of old, the deer come down to drink, secure in the fastnesses of the second-growth forest which has sprung up since the devastation by the lumbermen. Great are the recuperative powers of the wilderness, in regions where the soil does not tempt the farmer.

Where lies the valley in the hills, where nestles the house by the lake, I do not propose to tell. Those who have been there know, and happy are they.

FREDERIC IRLAND.

Eastern Shore Notes.

Editor Forest and Stream:

We are having quite a good many snipe, more than for any previous season. Dr. J. C. French is among us, and meets with fine success in snipe shooting each day that he is out, giving as his opinion that ours is as fine country as any he has ever visited for this game Further on we may expect an increase in the quantity. Accomac and Revels Island Club men are coming by almost every train, in anticipation, no doubt, of an early arrival of Atlantic coast birds.

T. G. E.

KELLER, Va., April 8.

A POOR SHOT.

In his generous acknowledgment of a very trifling favor, Mr. Hough has alluded to a little series of mine, relating to the history of the American rifle, which recently appeared in *Shooting and Fishing*. My investigations were prompted by observing that target shooters nowadays have little faith in the markmanship of the old frontiersmen. I suspected that this incredulity was due to indiscriminate novel reading and to yarns spun by the Sunday newspapers, rather than to accurate knowledge of historical facts. To test the matter I made a study of contemporary evidence and reached the following conclusion:

"There were liars before Ananias; but there were gentlemen, and crack shots too, long before you and I, my good fellow, cut our teeth."

Mr. Hough's delightful reminiscences make me think of a practical demonstration of this latter fact, with which I was recently favored and which impressed me more than any possible array of screeds and scrolls. It happened thus:

My father and mother came to visit us. My father was born and bred in the wilderness of western Pennsylvania, and still takes a keen interest in woodcraft, though his occupation has confined him to office work for many years. Knowing that he would enjoy a tramp in the woods, I took a day off and we went out to Mincke.

My squirrel rifle was at the gunsmith's, and the other hunting rifles were too powerful for such game as we might see, so I took along my target rifle. Father examined it curiously. He had never seen such a weapon. The wind gauge and vernier particularly impressed him.

"Well, well," he would say, "what improvements they have made since I was a boy! Just look at those sights! I wonder what Uncle George would have said about them! He used to shoot pretty well with the old flintlock; but, dear me, our rifles were very crude affairs in those days. Do you like such a short, stubby barrel? You do! Well, I guess it's all right with those fine sights. We used to prefer a 4ft. barrel; but we were away back in the woods and didn't know much."

He kept it up on that strain all the way to Mincke. I was sorry for the old gentleman. It made me feel mean to be enjoying all these improvements when his youth had been so hard and poor. The contrast must be pathetic to him. When we reached the woods, I thought to cheer him up a bit by remarking:

"Yes, the finish of our rifles nowadays may be finer, but I suppose the old muzzleloaders would shoot just as straight."

"I don't know—I don't know," he replied sadly.

"Well, you didn't often miss with them."

"No, not often. But we didn't dare miss; powder was too scarce."

"Lead too, I suppose."

"Well, not so scarce as powder, for we would use it over again."

"Use it over again?"

"Certainly. When we had enough powder to shoot at a mark, which was seldom, we would always put the mark on a tree and chop the bullets out. Even in shooting at deer, the bullet would generally lodge against the skin or on a bone, and we would run it over again. No, I guess you youngsters can shoot much better than we did, for you have plenty of ammunition to waste in target shooting; and then you have such fine sights—I wouldn't even know how to use them."

"Oh, yes, you would. Here, I'll tack this target on a tree and we'll try a few shots."

"No, no; you do the shooting. I can't shoot."

"Of course you can. Just try. You'll soon get the hang of those sights."

"Why, boy, I haven't fired a rifle since the war. And I never was anything of a shot. Zeke and Abe [two of his brothers] could beat me any time, and neither of them could shoot like father."

"Grandfather was a good shot, then?"

"Yes, pretty good. We had to live on deer and bear sometimes. He often shot them right in our little clearing, and once I saw him shoot a very large panther from our doorway. Yes, he was a good shot, though his brother George was better. George was a great hunter, and quite celebrated as a marksman. But I never took much to hunting, and was always counted a rather poor shot."

I wished now that I had said nothing about target shooting. It was thoughtless of me to have suggested such a thing. He was an old man, and had not fired a shot in thirty years. I knew him to be the soul of candor, and that he always meant precisely what he said. Of course he could not shoot now. Would the result only humiliate him by proving his failing sight and nerve?

"All right, I'll shoot, and you can score for me. It wouldn't be fair to have you shoot with a gun you have never used."

"Well, I'll try those sights anyway," he replied, "just to find out how they work."

Here was spirit. He wouldn't back down from a challenge—for so he had construed it—even in the face of certain defeat.

The target was up. I fired, and nipped the bull at 10 o'clock.

He took the rifle, threw his arm well out, and raised the piece, but complained that he could not see.

"Bring the peep closer to your eye—there, that's the way. Now don't flinch when you press the trigger."

I was rather nervous for him and gave him all sorts of good advice.

"Be careful, father, that is a set trigger."

"Boy," he replied, somewhat sternly, "I never used any other kind."

Then, for the first time, an uneasy suspicion crept over me that perhaps I was unnecessarily solicitous about the old gentleman.

Crack!

I was watching him closely. Blink? Flinch? Not a bit. He hadn't been brought up that way.

I went to the target. He had a line shot 3in. below the bullseye.

I took my turn and again got in the black.

He fired and shot into his first hole.

"That's funny," he said, "my sight was touching the mark."

He had been holding the aperture as if it were a pinhead. I explained that the bullseye should be centered in that little hole.

Firing again, I missed by 1in.

He shot deep into the black.

I began to feel uncomfortable. I had plenty of trouble on my hands now, and got down to work. He kept right on making bullseyes, talking all the time in his quiet, serious way about "I never was 'counted a good shot—Zeke could generally beat me—but father was a good hand with a rifle," and so on.

At the end of the tenth round I was a point in the lead, but he was steadily gaining, and if we had kept the game up a little longer I would certainly have been beaten. Father had evidently expected to see me shoot better, but he was too much of a gentleman to say so. His work amazed me; but he kept on apologizing for it, and the worst of the matter was that his humility was perfectly sincere.

By and by he strolled up the hill, while I sat down on a log and had a big think all to myself.

No, he never was 'counted a good shot—Zeke could beat him, so could Abe—his father was better than any of them—and Uncle George was a real marksman. "But my! what improvements you have made!"

HORACE KEPHART.

ST LOUIS.

DRILLING AN ALLIGATOR.

There lies between the Atlantic and the Indian River in the peninsula of Florida a beautiful island, famous for its fruits and flowers and game. It is Merritt's Island. Nature (for it is said the Creator did not make that part of Florida) seems to have been very careful about how it made that island, for it was one of its last tasks. Along the shores of the Indian River is an unbroken hammock, elevated, tropic. The plain recedes toward the Banana River; is composed of savannas at regular intervals of one-fourth mile, lying parallel with the rivers, the interspaces are elevated beds of low palmetto. Who does not love to wander among these grassy meadows, flower adorned, between their green hedge borders? To the north is a perfect prairie; in it, here and there, stands the lone, stately palm, its trunk bleached white with tropic storms and age. Round about, without studied order, is the small jungle hummock. Nature had spent her 'prentice hand upon the rugged mountains and strands of the north, became lazy, romantic and æsthetic when she reached the tropic sun; adorned her farewell effort of love with this picture; framed it in silver with the rivers and commanded the winds from the Atlantic now and then for a change to frost these frames with the gentle whitecaps of the tropics.

But there is a gator in this picture and he must be caught, but the ugly saurian hides there in his cave.

Two hunters from the Virginias are partial to that island and were there, as usual, last winter. One warm, dry day their hound had long and faithfully been trailing a deer and became very tired and thirsty, and these hunters led him from the trail to search for water. At a distance a flag pond was seen, but when examined contained, about the middle, only a small pool. "Graeme," said Capert, "here is a gator cave and the gator has just gone in. Ride up with Dick and let him drink, and I'll have my gun ready for the gator if he makes at him."

Dick knew a gator as well as the hunters, but he was so thirsty that he crouched and crawled to the brink, and while drinking, the gator, without stirring the water, eased his head out, when the white about his eyes and end of his nose gave him away. He wanted Dick, but came no further, and it was decided to leave him and let Steen, the camp-keeper, "drill" him. Steen is a cheerful, good-natured native Floridian, about 6ft. 4in. high, weighs only about 140lbs., and was once a professional gator hunter, in the days when they were plenty. He was told about the gator, and proposed an exhibition of his skill in drilling, to see which he was in a few days accompanied by Graeme.

In the ponds inhabited by the gators the roots of the flags and grasses make a thick strong sod, in this instance quite 2ft. The gator was at home. Before reaching his cave Steen cut a green pine sapling, about 2in. in diameter and about 15ft. long. He carefully trimmed all the limbs and rough places off and made very sharp-pointed the larger end. The gator, in making his cave, had burrowed below the roots in the sod, getting under which it then made a hole off straight under it. Of course, there was water in the hole; it was full and stood in a pool at the mouth.

Steen rolled up his sleeves, stretched out on the ground and thrust his pike in. "I want the bearin' of the cave," said he. "This is a long un; my drill won't reach the eend," so he thrust his long arm in with the pole as far as he could reach. "Now I've got the bearin', Mr. Graeme, I'll go to the other eend and begin to drill; you stand on this side of the mouth next to me and have your gun ready, and when you see his knot [this meant head] his two eyes will look kinder white, shoot him right between them; when I hit the cave, you cin tell by the water swellin' out at the mouth. I hit him, he's comin'."

Sure enough, he had struck the hole with the sharp stick which he had thrust through the soft earth and sod, and he repeated this at short spaces, nearing the mouth at each time, until finally almost without seeing a motion or the saurian he thrust his head out of the cave, still beneath the water, and Graeme shot him just as directed. Steen left his drill, ran to the mouth of the cave. "You've done him up," said he, and while the water was yet muddy he thrust his hand below the under jaw of the gator, pressed his head back against the earth and out of the water, then clasped both hands around his mouth, and drew out a gator 7ft. long.

"Well, Steen," said Graeme, "this is the first gator ever I shot, though I have seen quite a number; poor sport for a hunter; would just as leave shoot a log; only shot it to carry out our programme of drilling."

But it revived memories of the old-time sport in Steen, and he ripped his hide off almost as quickly as it had been killed.

S. C. GRAHAM.

VIRGINIA.

New York has always had Game Laws.

To an inquirer who asked the other day about the length of time New York had had game laws, we replied off-hand that probably such laws had originated in colonial times and had held ever since. Mr. Robert B. Lawrence, Secretary of the New York Association for the Protection of Fish and Game, tells us: "Without looking up the old session laws I cannot tell you when the original game law went into effect. Our New York Association for the Protection of Game (not the New York State Association) was founded on Monday, May 20, 1844, and the first suit brought by the Association was against one Daniel Young, of Fulton Market, on June 8, 1844; so there must have been a game law at that time."

Natural History.

COYOTES HUNTING IN BANDS.

OROVILLE, Wash., March 22.—*Editor Forest and Stream:* In your issue of the 6th inst., Mr. Thompson asks for information in regard to coyotes hunting in bands the same as the big wolf. They do so here in this part of the country.

A few years ago along in the spring I took my rifle and started up into the open hills to kill some grouse, and when I got up on to the top of a small ridge that puts down between my creek and the Columbia River, I stood still for a while listening for a grouse to hoot.

Across from where I stood was quite a high mountain, covered with bunch grass and a few scattering pines; the snow had not all gone, especially near the top. I had not stopped very long when I saw a deer coming over the hill, and from the way it was coming I knew there was something after it. Soon I saw two coyotes down to the right, and the way they were running I thought they were trying to head the deer off from the river. Soon I saw two more on the trail, and then I saw two more to the left, and it looked to me as if those that were on the flanks were running the fastest. There was a crossing in a gap in the ridge I was on, and I knew the deer would come through that gap; so I ran down toward the gap, not that I wanted to shoot the deer, but I wanted to shoot at the coyotes that were on the deer's track.

I had not got quite down to the gap when the deer came through. It was a white-tail buck and he was doing his best to get to the river. I had but a short time to wait when the two coyotes came along. I whistled when they got opposite to me and they stopped and looked up. I fired at the one that looked the largest. At the crack of the rifle it started and ran as fast as it could for about 50yds. and rolled over dead. The other followed it for a few yards and then turned off up the hill, and when it saw its mate roll over it stopped. I shot at it, and as I did not make the right allowance for distance undershot and broke one of its legs. I put my dog after it and he soon brought it to bay, and I had the satisfaction of killing it.

On another occasion I was coming down from a neighbor's, and when near the bottom on the Columbia I noticed a couple of coyotes hunting through the grass and low bushes; they had their tails up like a dog and seemed to be as busy.

Soon they were joined by two more and all had their tails up, and as they had not discovered me I waited to see what they were after. I never saw dogs hunt through a flat more diligently than they did, and it looked so amusing to see them with their tails up. I think they were hunting chipmunks. Not having anything to shoot with, I started on, and when they saw me they trotted off up the gulch, but lowered their tails, coyote-like.

I have often been told by white men and by Indians that they had seen as many as fifteen after one deer. This winter while on a trip to Curlew I had to go down on Kettle River, and I saw where six deer had been caught by coyotes. I examined to see whether any big wolves had been among them, but did not see a track. An old Indian told me that a few days before the coyotes had run a deer down on to the ice and caught it and he heard it bleat, and he ran down, but when he got there they had almost eaten it up.

This has been a rough year on deer in this part of Uncle Sam's domain. First came the prospectors, then the Indians from below, then a hard winter, and now the Indians along the Okanogan are hunting in the rocky bluffs for what few that have run the gauntlet of the wolves and snow. It is the first winter in over forty that I have not killed a deer, and I have no inclination to kill any more, although should I be where I needed one for grub I would kill one or more. And yet it will be some time before you will see a .38-55 rifle offered for sale by

LEW WILMOT.

DID THEY REASON?

VINTON, Ia., March 19.—*Editor Forest and Stream:* A few days ago my business affairs (pulling one end of a cross-cut saw) took me to the grove between my cornstalk field and hog lot. In the grove is a board gate. East from this gate is an osage hedge and on the west a woven wire fence. Shep and Mick (the latter a cross between a spaniel and a setter) jumped the gate and went into the stalk field. Soon I heard a yep! yep! and a rabbit came spinning through the gate. Shep made a clean jump, Mick landed on top of the gate and the rabbit ran under the hen house. The dogs came back smiling and wagging their tails and went into the stalk field again. In a little while there was a yep! yep! and we straightened up to see the hurdle leap. This time Mick was in the lead, and when the rabbit went through the gate he went around through the hedge and so lost time, but old Shep came pounding along and sailed through the air like an athlete. The rabbit rushed in among some hogs, which snorted and jumped in all directions, and frightened the rabbit so that it squatted down, which nearly proved fatal; but it stretched its legs out just in time to get under the corn crib. Back came the dogs wiggling all over and grinning, and again went into the stalk field.

Mick started the third heat with a couple of yeps. A long way ahead of Mick and coming down a corn row that led straight to the gate was old Shep, knocking the stalks right and left and making the run of his life. I saw that there was no rabbit ahead of him and wondered what could be the matter with the old fool. But Shep was no fool, he was using the best kind of reason. Occasionally Mick would give a yep, and Shep would let into it all the harder. Soon I saw the rabbit back of Shep and coming up a corn row, which also led to the gate and about 12ft. from the one that Shep was in. Five rods from the gate the rabbit was running abreast of Shep, who paid no attention to the rabbit, but was kicking the mud into the air to beat all.

The rabbit reached the gate first, but jumped to one side and ran along the hedge, and that was what old Shep wanted to do, but he was under too much headway and had to make the jump, but it was not that graceful leap that he had been making; his ears stuck up, his legs were sprawled out, and he was so anxious to get to the ground. When he had pulled himself together he started down along the hedge. Mick came up just then and went down the other side.

Now, when Mick had started the rabbit he had hallooed to Shep to let him know it; but Shep, instead of running to Mick and the rabbit, ran for the gate, which was in the opposite direction. There is no doubt that Shep reasoned that Mick would bring the rabbit to the gate, and that he tried to get there first.

This winter my son started up a rabbit near the creek, and at that point there was a hole in the ice. The dog ran the rabbit in a circle, and when it had got to the starting place the dog was pushing it hard, and it ran straight for the open water, jumped in and swam under the ice. It stayed under long enough to fool the dog, but when it came out it was so far gone it could not stand. I let it stay in the house until it became dry, then let it go. Mick took its track and ran it into a hole. I went there and found on the side of the hole a fresh, full-sized rabbit tail. That was a smart rabbit, but if it jumps into another water hole, what will the poor thing do with no rudder to steer with?

Not long ago I saw a rabbit play a trick on a dog that I never saw done before. A dog ran a rabbit into the road, and it came near running under my horses, but jumped back, and the dog came near catching it, but it dove into the snow out of sight. The dog grabbed into the snow where the rabbit went, but did not get it. Then the dog put its head into the snow above its eyes and pushed along in the snow. The rabbit came out of the snow 3ft. from the dog and went under a bridge. When I went out of sight the dog stood there wondering how it was done.

It seems to me that the dogs and rabbits did about as I would under similar circumstances. MOUNT TOM.

Collisions in the Air.

SEATTLE, Wash.—The champion story-teller, according to one of your correspondents, was the man who saw two wild ducks flying in opposite directions meet and hit each other, both being killed by the shock. I believe the case may have been true. On Puget Sound sea gulls are protected by law. In consequence they are very tame, and follow the steamers which ply from point to point, searching for scraps of food. They frequently fly near the upper guards, and passengers throw food to them to see them swoop and catch it on the fly. Coming from Dungeness on the Evangel recently, I saw two gulls, both swooping for a bit of bread, run into each other so hard that one of them lost his balance and fell nearly to the water. On the trip from which I was returning I saw distinctly two wild geese in a flock, into which I had just fired, run into each other, though going in the same direction. This last happened though, I surmise, because I had just fired a rear quartering shot (rifle) in front of the one who bunched up into his neighbor.

While watching the gulls I have spoken of, the mate of the Evangel told me, what I had noticed myself, that the gulls on the Sound seem to have regular beats like a policeman; that is to say they pick up a boat at a given spot, and leave her at another. The mate said that on a certain run he had formerly made he and the crew identified a certain gull by a peculiarly broken leg; and that as regular as clockwork daily for months, as long as he was on that steamer, that bird would appear off a certain point and leave at a certain rock on their course. X. Y. Z.

Crocodiles of Nicaragua.

CALAIS, Me.—*Editor Forest and Stream:* The Spanish Main notes, by J. F. Le Baron, are very interesting, but I cannot understand about the crocodile's upper jaw being hinged different from the alligator, so that it can be thrown up at right angles to the body. If that is the case they must be different from the south Florida crocodiles or the South American, as you can see by the skulls in most any large museum, but the Nicaraguan crocodile may be different I should like to know. GEO. A BOARDMAN.

JACKSONVILLE, Fla.—*Editor Forest and Stream:* As to the statement of mine that the Nicaragua crocodile opens its jaw at right angles, you may rest assured that it is correct. I have seen them on probably a dozen different occasions lying in that way, and have shot them when in that position also. The hotter the sun the more they are apt to assume this attitude. The upper jaw is thrown up perfectly perpendicular, and I have seen them lie this way for hours at a time on a sand bank in the San Juan River, opposite my headquarters, when in charge of the surveying parties on the canal. Other members of the expedition observed them also, and it would be easy to establish the fact by others. I am also informed by a civil engineer who has spent several years in South America, in Bogota and Peru, that he had often observed them in the same attitude there.

J FRANCIS LE BARON.

Birds of the Galapagos.

THE "Proceedings of the United States National Museum for 1896" contain, among other things, an extremely interesting paper on the birds of Galapagos Archipelago, by Robert Ridgway, Curator of the Department of Birds.

While this lonely group of islands, lying off the coast of Ecuador, has very often been visited, it cannot be said that any one of its members has been thoroughly explored. The present work is intended to embody practically all that is known of the birds of these islands, yet for the reason mentioned it cannot claim to be exhaustive. At the same time it gives detailed descriptions of 105 species of birds, representing forty-six genera. Many of these are wandering species, which have a very wide range; but there are several genera which are peculiar to these islands, and which show relationships in two opposite directions. Thus two of these genera seem to have their nearest allies in American forms of birds, while three of them have a very obvious leaning toward well-known Hawaiian forms So it is that the bird life of these Archipelagoes presents many puzzling questions, which are not to be settled without further information.

Mr Ridgway gives a number of lists of birds to be found on the different islands of the Archipelago, and repeats frequently a small outline chart of the islands on which are set down localities at which certain genera and species have been found. The paper contains two plates giving outlines of bills of three characteristic forms of Galapagoan birds.

Bluebirds in Central New York.

ITHACA, N. Y.—Bird observers note the fact that the bluebirds were early March arrivals in this locality, the old time haunts, which for the past two or three years have known them not, being frequented by them quite numerously, much to the delight of ornithologists in general. M. CHILL.

Game Bag and Gun.

CHICAGO AND THE WEST.

In the Blackfoot Country.

BLACKFOOT RESERVATION, Blackfoot, Mont., March 26.—A year ago some of the Blackfoot people made a visit East to the Sportsmen's Exposition, at New York, as guests of the FOREST AND STREAM. This visit is well remembered by very many friends who met them at Madison Square Garden, and these friends will be glad to hear of them all again. In turn they have become hosts, and a representative of FOREST AND STREAM is their fortunate guest Bear Chief, J. W. Schultz, Billy Jackson, Natoka and the little favorite, Natoye, are all here and all well. There is still another little one in Billy Jackson's family now, an infant that is striving to wrest away from Natoye her supremacy, though the latter is too fat and chipper to evince much dread of that or of anything else. Bear Chief is the same as ever, and he bore a beaming smile when he met us at the train and bade us welcome to his country. These several friends of FOREST AND STREAM and also Mr. Jos. Kipp, of Kipp, Mont., vouched for Mr. C. S. McChesney, of Troy, N. Y., and for the writer, so the agent of this reservation, Maj Geo. Steell, pulled down the big bars marked "U. S." and told us to come ahead and run the reservation for awhile. We have been doing that very pleasantly and successfully now for a couple of weeks, as we shall later attempt to set forth in part. We shall give Maj. Steell back his reservation with unfeigned regret, and turn East again with the same old sinking of the heart which every one feels when he turns his back on the Rockies and starts out into the flat monotony of the prairies, the cities and the mill-round of modern business life in the busy centers. The guests of FOREST AND STREAM say that they enjoyed their visit East, but surely it must have been a mild pleasure compared to that felt by those who are now their guests.

This is an inspiring country. Imagine a great wide prairie, illimitable, now flat and even, now broken by coulee and butte, beginning at the edge and running to the unseen ultimate. This prairie itself has a great meaning. But out of it, upon the west rim edge, rise up, boldly and unpremeditatedly, without excuse and beyond need of apology, a grand swing of one of the noblest mountain chains of the world. You see the Rockies in Colorado, in New Mexico, and they beg your pardon in a thousand foothills These mountains—the St. Mary's, the Two Medicines—tarry not at all, but rise at once strongly up out of the level. In no other part of the Rockies is this peculiar abruptness so noticeable. And far away across the prairies, apparently only forty miles away, but really about 100, lie the storied Sweet Grass Hills. Between these rocky rims is a grand level cup full of history, of adventure, of hunting, and of war and of peace and progress. Much of all this has been told in FOREST AND STREAM at better hands, and much of it set down in the "Blackfoot Lodge Tales;" but to see this country and to learn even a little of it adds new charm and zest to every line one has ever read about it.

Yesterday Billy Kipp took McChesney and me out wolf hunting, and we rode some forty miles or so over what was once the buffalo country. We found one frayed and weathered bull's horn, the only reminder of the old herds. But we saw thousands of the spotted cattle, and we saw the houses of the people who have now forsaken the chase and turned their hands to other things. The Blackfeet are now a great family, living in peace and content No tribe of the American Indians has made such rapid progress as they. Their agent speaks of his people with affection and pride, and it is only just to say that this is returned by the people. Common supposition, which is common ignorance, pictures a sad state of affairs always in progress on an Indian reservation. The Indians are supposed to be always slothful and in need, the agent always avaricious and in plenty. It will take years of education to remove this cruelly false belief. Here is a people anxious to work, anxious to learn; and their executive and head both gives and receives of a confidence worthy of nothing less than the highest name. However it may be upon other reservations, here at least is one where the Indians and the agent believe in each other. Let us hope that politics will not soon interfere to unsettle this mutual content

The Blackfeet have ceased to be hunters. They have cattle. They raise oats, potatoes, many things upon their farms. Among them are many who do not go up among these mountains which fence their reservation. Last year they sold a million and a half dollars' worth of land to the United States for the use of the miners, who want the St. Mary's and the Two Medicines for their own. It is quite possible that the Indians bargained well, but this spring there is to be seen again in force one of the queer Western crazes, a mining boom, if not a mining stampede. Before the grass has lost its green again there will be a newspaper printed in the St Mary's, the sound of its hand lever within earshot for the strange white goats and for the big-horns. There will be doctors, lawyers, merchants, thieves, in the St. Mary's this summer. They will bore holes and burn powder, and frighten the sheep and goats. Then let us hope they will go away, and leave the sheep and goats to a country which is naturally their own.

There is no portion of the Rockies more rugged, more picturesque or more fascinating than this wild range of mountains which lies before me as I write. It is the best sheep and goat country of the whole Rocky range, in all probability. It is not surpassed by any section for the size and number of its grizzly bears. Indeed, so confident do Messrs. Schultz and Jackson feel about the abundance of bears that they publicly offer any gentleman who has lost a bear to take him out free of charge if he does not get a shot at his bear. This is fair enough, and a bit unusual, I take it. The month of May is the one for the bears. They are not quite ripe yet or we would pick a few of them. This, pending the coming of the newspaper and the location notice, remains a corner of the genuine West; for two, McChesney and I, under the friendly guidance of J. W. Schultz and Billy Jackson, have been sampling the keen delights which are to be found nowhere except in that genuine West. That such an experience was possible is to be attributed distinctly to the FOREST AND STREAM luck. When I say that Maj. Steell told us to go up in the mountains and kill a few rams (the State laws not applying on Indian lands), and when I add that we did go up into the mountains, and that the FOREST AND STREAM luck still held, I have said about all that seems meet just now. There remain yet a few more things to be seen and done before the wrench of parting from the Rockies I suppose that fellows have sweethearts and that sweethearts hav

new clothes upon a time. These are the Rockies in new clothes. To me it seems they never were so adorable. To-day, for the first time in many days, they are calm and clear and smiling of visage, and every feature is clear cut against the sky. To-day the prairies are running water, but up in the mountains, as we know from two weeks of winter camping there, the snow is very deep and the winds are strong. But the FOREST AND STREAM luck held. E. HOUGH.

HOURS IN A BLIND.—V.

(*Continued from page 266*)

Life of the Marsh.

THE birds which pass over or stop on the marsh are its most obvious inhabitants; but there are many others which the casual visitor scarcely ever sees. Of these the largest are the half wild horses, cattle and hogs turned out to winter by their owners. They feed among the tall cane, and only now and then come to the water's edge to drink or to eat the succulent water plants that drift against the shore.

With these animals the struggle for existence must be a severe one; for, to one accustomed to the pastures of the North or West it would seem that there is little or nothing to eat on the marsh. Of course, vegetation is not lacking; but there can be little nutriment in the hard cane or its marsh leaves, or in the coarse round marsh grass which grows only in infrequent patches. The drifting grass, which consists of the rejected portions of the water plants pulled up by the wildfowl in their search for its roots, is scanty in quantity and can hardly be very nourishing food. The hogs do better than horses or cattle, for they unearth the roots of the cane and the flags, and must procure not a little animal food.

The horses are confined to the outer beach, and visit the adjacent marsh only to feed. They are little animals, not unlike the well-known Chincoteague beach ponies, and are all branded. They are a tough and hardy race, qualified through inheritance and experience well to fight the battle of life. The cattle are small, wild and scrawny.

Occasionally when you are sailing through these waters you will see, as you pass a watchman's house, a fresh skin tucked up to dry, and the long ringed tail hanging down from it at once proclaims its species. Coons are abundant here, and it is not strange that they are so. In summer the nesting birds and in winter the crippled ducks furnish them feathered food, while at all seasons the waters abound in fish. We are most of us accustomed to think of coons as passing a good part of their time in trees, but the coons of the marsh must by this time, I should think, have lost the art of tree climbing; since, except for an occasional straggling pillintary bush, there is here nothing larger to climb than a stalk of cane. Rarely seen by the gunner, the coon lives an easy, lazy life here. Now and then he puts his foot in a marshman's trap, and less often a gunner's dog, hunting for a wounded duck, may suddenly fall upon him, and the sound of the fight will empty the blind, and bring boatman and gunner crashing through the cane to learn the cause of the disturbance. It is in such ways as these that the coon is sometimes killed.

Next in order after the coon comes the mink—artful, ferocious, daring. Like the coon, he fishes and hunts, but he has ten times the coon's energy. Not satisfied with the wild game of the marsh, he prowls about the blind and may steal a duck, if one is carelessly left at a little distance. He fights the muskrat, and sometimes kills and eats him, and then he goes fishing every day. The mink is rarely killed except by the trapper.

The muskrat is everywhere, and if you have occasion to walk across the marsh you will now and then plunge thigh deep into one of the holes that it has dug. Sometimes as you sit in your blind you will see it swimming toward your decoys, or crossing some lead not far away. It does no special harm except by its burrowing, which breaks away the marsh, destroys ditches that may have been cut, and makes pitfalls for the careless to fall into.

In the winter, when I see the marsh, its reptiles are safely bidden away in their warm sleeping places. So it is that the snakes, if any there be, and the tortoises are not seen. But in summer, I am told, there are snakes and snappers and terrapin; of these last there are not many.

All through the winter, however—except when, as sometimes occurs, a freeze has locked the waters of the sound—there are fish a-plenty. Of these the most important and valuable are chub, which I take to be the large-mouthed black bass; but there are many other smaller sorts which may or may not be good to eat. The common blue crab abounds here in summer, and everywhere on the marsh its shells may be seen—the relics of feasts had by the coons.

In the spring and the late summer these marshes are the resting places of thousands on thousands of beach birds and rails. Here may be found great flocks of waders of all descriptions, from the tiniest sandpiper up to the great sickle-bill curlew. These sandpipers and rails wade busily about over the mud flats where the ducks have been swimming or probe them for food. Then gulls of many sorts winnow their slow way over the broad channels, and companies of sea swallows hunt the schools of tiny fish that swim in the shallows.

At whatever season of the year you take it, the life of the marsh is abundant, and is worth observation and study.

The Swan Song.

We are told that it is the dying swan that sings the sweetest song. Those that we see about the marsh are musical enough, but so few of them are killed that I cannot believe that the ordinary note which they utter is the one which immediately precedes death. Yet it is a soft, sweet call, high pitched, pleasing and hard to imitate. *Koo, koo, kookoo, koo*, is the way it goes, the flock calling to their leader, and the leader answering them again.

In ancient song and in story the swan holds a firm place, nor is his eminence confined to any land. To Lohengrin in his search for the Holy Grail, and to the Blackfoot Indian seeking out the home of the Sun, swans come as supernatural helpers.

Its size, the purity of its plumage, and its soft, sweet notes make the swan always a striking object, and it is not strange that this bird should have impressed itself on the imagination of all peoples, and that this impression should find voice in the folk stories of races which have attained the highest civilization and culture, as well as of tribes that are still savages. As the mind of man is everywhere the same, so we see that swans are used by the ancient gods as messengers and beasts of burden, and in the same way and with a like object they draw the car of a Lohengrin and carry across the ocean an American Scarface.

The swans move slowly through the sky, with wingbeats that seem heavy and labored, but which carry them forward at a high rate of speed. If that flock were near enough for you to kill one of those birds and you did so, you would find that in falling his impetus would carry him a long way forward before he struck the earth or the water.

Swans are killed usually only when by chance they fly over the blind low enough to be reached with a shotgun. Few gunners have swan decoys, though I have seen, on the sloops of one or two professionals, a great pile of these; for the swan will decoy readily, coming either to swan decoys or to the call alone. I remember once tying out at a point in a bay from which we put out great flocks of swans and geese, and an hour or two later a single swan was seen flying toward the bay. My boatman called to it, while I tried to change the duck cartridges which were in the gun for those loaded with buckshot, which were laying ready for just such an emergency. Alas for the chance! The day was rainy, the chambers of my gun a little foul from smoke, and the cartridges had swelled. It took me a long time to get out the ones that were in and a long time to insert the others in the chamber. While I was wretchedly working at this I was reduced to the last pitch of nervousness by the boatman, who punctuated his calls to the swan by remarks such as these: "Here he comes!" "He's heading right for us!" "Be ready now, he's almost near enough!" "Now he's right over the decoys; get up and kill him!" "Oh, shoot, shoot!" "There he goes!" "He's gone!" There was a pause, during which I managed to shove first one and then the other cartridge into the gun; but before I had closed it the boatman whispered excitedly: "Here he comes back again, right over the decoys!" Closing the gun, I stood up and killed the great bird just beyond my furthest decoys.

"Oh!" cried the boatman, as he ran to the skiff to get the bird, "that's wuth a dollar—a dollar, sir."

Sometimes swans do curious things. Once watching a wedge of seven birds that flew over, 200 or 300yds. distant, and that were slowly lowering themselves toward the waters of the sound, I saw one bird help himself along by means of another. The last swan on one arm of the V seemed higher than the others, which were close in front of him, and with a quick stroke or two he overtook the bird immediately before him, caught his tail feathers in his bill, and, bending his neck, pulled his own breast close to the tail of the other bird, whose progress seemed absolutely stopped. Then the last bird let go the tail and they all went on. It looked as if the last bird had used the other to pull himself down to its level, being himself too impatient to wait for the slower descent of flight. The occurrence seemed to me a remarkable one, and called up to my mind the old story of little birds crossing the Mediterranean on the backs of owls, geese and cranes, and the story, related years ago in FOREST AND STREAM by Dr. J. C. Merrill, of the Crow Indians.

Taking Up.

All day long the gray clouds have hung low over the waters, and occasionally the sad heavens have dropped down their rains, which the winds have thrown spitefully against us Now, however, just at the close of the day, the broad orb of the sun looks out at us from the western sky just as it is falling below the horizon. Slowly it sinks until only a thin red line is visible above the low distant forest which bounds the view to the west. I take a last long look about me to see if perhaps a duck will come before the sun has actually set; but, seeing no bird, I break down my gun and say to John, "Take up."

As he crashes through the cane to get the skiff, I unload both guns and put them in their covers, close ammunition box, and begin to carry the things down to the edge of the marsh. John is already among the decoys, taking up first the live ducks—which he puts in their coop—and then the wooden ones, which he stacks neatly in their places. Then, when he pushes the boat to the marsh, I pass him the things from the shore, handing him last of all the ducks, which he packs away on and abaft the decoys, counting them as he lays them down: "Twenty-seven, twenty-eight, twenty-nine, thirty, and the hairy crown's thirty-one. A pretty good day's work, sir!"

I put on my heavy coat and step in the skiff, and while I light my pipe John pushes the boat through the shallow water, and presently steps the mast and sets the sail, and with a merry ripple the little boat bears us homeward.

"Well, John, it's my last day, and it has been a good one. I am sorry to go."

"I wish you could stay longer, sir; but anyhow you've had some good shooting, and you certainly have done right well—better'n I thought you could that first day."

And so I have. COUPLES.

SHOOTING PRIVILEGES AND TRESPASS.

Editor Forest and Stream:

I notice in the present issue of FOREST AND STREAM (April 3), speaking editorially on the shooting affray that took place on the Tolleston Club grounds, in Indiana, that in condemning the absurd bill to legalize trespass that was presented in the Indiana Legislature, you go a step further and point out what you believe to be the tendency among landowners of the country at large, namely, "to make more clearly defined and more stringently enforced their exclusive right to control their lands as they please."

Very good. We have been taught that it is good law that the wild game of the country belongs to the people just as much as navigable waters and highways, the taxing power, etc. But if every owner of land in Indiana, California, etc., decides to exercise his "right to exclusive control" of his land, where will the fellow come in who has a gun, who loves to hunt as well as the landowner and who has proven his right to live by earning his living. The game belongs to the State, yet only such citizens of the State as happen to own land can touch it. In other words, has the owner of the land something which is yours as much as his, yet can keep you from having it? How is that?

I do most of my hunting on land that is not yet owned by private individuals, or by railroads and timber companies that do not yet care to enforce every prerogative that ownership of land gives. But the moment they do, what becomes of me? Where can I go that I will not be at least technically a trespasser? You have been foremost in the protest against discriminating taxes on guns, which would place a poor man at the disadvantage of a richer one in the exercise of his natural right. But if the owners of land, who are few compared with the army of men and women who love the woods and the fields, and who go there to fish and shoot and live for a space an outdoor life, choose to exercise their prerogative and keep us off, what then?

I am not speaking to defend the action of either side in these clashes between those who have often made their privileges valuable by improving them, and that other larger mass who do not yet sufficiently understand their natural rights nor the limitations to the exercise of individual freedom. I do not excuse the mistakes of either side; I deplore the killing of a human being, whether by a game club's warden, who may be acting in a legal way, or by some ignorant yap who feels that somehow he is being deprived of a natural right. But I do wish to say that I certainly do hope that the tendency on the part of owners of land is not toward a more strict enforcement of their legal rights to claim exclusive use of that which God has placed on their lands for the use of all. It is not something to be settled in a day, and our present laws of all kinds are an indication that it will not be settled in many days; but it is something for thoughtful persons to think about.

Also, if we are to continue to have some kind of game, we must look right away to the enforcing of better game laws, or we will indeed have all the game in the country in the parks of a few rich clubs and individuals. It is the testimony of history that where individuals have acquired privileges which they abused, the people had proven unworthy of the possession of their so-called rights. Landowners are finding the game disappearing, and they choose to enforce more strictly their right to that which the law says is theirs. The abuse of the land-owning privilege is at the bottom of much of the evil of the monopolies we hear about, but the surest way to extend the evil is to fail to provide for the adequate protection of game. If the country is turned into private game preserves and the man with a gun but no land has nowhere to go, he will have no one but himself to blame. If, when adequate laws are passed, the areas over which a person may hunt become restricted, then there will be that question to settle; but the one of the game laws is just now the more urgent. After that let him think of the other. TAPPAN ADNEY.

A TRAGEDY OF THE WOODS.

THE day was hot and sultry. The scorching rays of the midsummer sun penetrated through the verdant foliage of the large oak forest and sprinkled the winding paths with plenteous spots all aglow with his reflected rays. The silence was well nigh complete, save when it was now and then gently broken by the twittering of a hummingbird or suddenly rent by the fierce calls of a crow. A large black snake lay sunning himself in the path, and was presently aroused to proceed in his sinuous career by the sound of approaching footfalls.

A man, clad in corduroy trousers and canvas coat, armed with a rifle of small caliber, which he carried carelessly over his shoulder, entered the wood. His lithe step betokened an active man. He pressed on quickly, yet no stick cracked under his feet, no bough was jarred in his onward career. Invading as he was the realms of nature, his true hunter's instinct told him that the skill of man must be used in all its effectiveness in order to cope with the alert faculties of nature's children. He knew too that the little gray squirrel is far from being a novice among nature's "artful dodgers." The little gray fellow has skill too. And, dear hunter, is not his skill used for a nobler purpose than yours? He uses his to evade; you use yours to invade. He uses his to live; you use yours to kill. His is a weapon of defense; yours is a weapon of offense. Yes, there is a sad side to a hunter's life. His pleasure is keen while the excitement lasts, but when in sober reflection he glances at the limp, almost lifeless little form before him; sees its life blood ebbing away; sees a happy, beautiful, harmless creature cut off in its career; sees it in the agony of its death struggles, or hears its piercing cry for help, the animal of the man goes out for a moment, his savage nature departs for a season, and that God-like element of pity comes to the rescue. But this is aside.

The hunter presses onward into the thick of the forest. Presently he stops to listen. Hark! what is that he hears? He hears something, for he starts slightly and gazes intently into the wood. It is the sound of falling hickory nuts, and the hunter proceeds cautiously to the spot from whence the sounds proceed. Far up into the limbs of a tall hickory tree there sits a little animal, innocent, yet alert; graceful, yet muscular. His little eyes shine radiantly. The color of his coat resembles marvelously the limb upon which he is sitting. His bushy tail is curled over his back. He sits almost as still as death, and were it not for the movement of his jaws as he scrapes the hickory nut he could scarcely have been distinguished from a knot on a limb. Interested as this little fellow was in obtaining his daily food, he did not see the hunter approaching; he did not hear the click of the hammer when the rifle was cocked; and he did not know until it was too late that fate was plotting his downfall. Crack! went the little rifle, and the little gray fellow started at the sound. The half-eaten hickory nut dropped from his jaws to the ground. He tried to scamper away to his den, but his limbs seem to fail him. He seemed to have lost his head. After he had darted to and fro for several minutes, in seeming delirium, he stopped, he wavered. He would seem on the point of falling on one side of a limb, but would catch himself with his sharp claws, only to repeat the performance on the other side. Finally his efforts became more and more feeble. His eyes slowly but surely lost their luster; his claws by degrees lost their tenacity, until at last he fell to the earth, dead. The hunter picked up the limp form and placed it in his pocket, glancing the while to note whether or not he had made a center shot. Thus ended the tragedy of the woods.

The sun sunk deeper into the west. A slight breeze arose and sighed through the tree tops. The hunter went silently homeward, and as he turned to glance toward the woods he had just left he sighed and realized that the curtain had fallen upon the closing scene of one little hero's play upon the stage of life. BANG-BANG.

VIRGINIA.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

THE MAINE GUIDE LAW.

Full Text of Chap. 26, Laws 1897.

SEC. 1. No person shall engage in the business of guiding, as the term is commonly understood, before he has caused his name, age and residence to be recorded in a book kept for that purpose by the Commissioners of Inland Fisheries and Game, and procured a certificate from said Commissioners setting forth in substance that he is deemed suitable to act as a guide either for inland fishing or forest hunting, or both, as the case may be. Whoever engages in the business of guiding without having complied with the provisions of this section forfeits $50 and costs of prosecution.

SEC. 2. Each registered guide shall from time to time, as often as requested by the Commissioners, on blanks furnished him by the Commissioners, forward a statement to them of the number of persons he has guided in inland fishing and forest hunting during the time called for in said statement, the number of days he has been employed as a guide, and such other useful information relative to the inland fish and game, forest fires and the preservation of the forests in the localities where he has guided, as the Commissioners may deem of importance to the State.

SEC. 3. Such registration as is herein required shall take place annually on or before July 1; but nothing herein shall be construed to debar the Commissioners of Inland Fisheries and Game of the right, in their discretion, to register guides at any time.

SEC. 4. Whenever any guide, registered as aforesaid, is convicted of any violation of the inland fish and game laws, he shall forfeit his certificate and be debarred from further engaging in the business of guiding for one year thereafter.

SEC. 5. This act shall not be construed to apply to any person who does not directly or indirectly hold himself out to the public as a guide, or directly or indirectly solicit employment as such.

SEC. 6. A fee of $1 shall be paid by each person registered in accordance with the provisions of this act, and all money thus received shall be and become part of the fund for the protection of inland fish and game.

SEC. 7. Any person desiring to be registered as a guide, in accordance with the provisions of this act, may make application for such registration either in person or by written application to the Commissioners. (Approved March 23.)

[The moose season is made Oct. 15 to Dec. 1, cows protected; deer season remains the same; lawful number in a season, one bull moose, one caribou, two deer.]

THE PENNSYLVANIA GAME LAW.

STROMSVILLE, Pa., March 28.—*Editor Forest and Stream:* I have neither the time, talent, nor inclination to enter into a public controversy; and were it not for the rancorous articles and gross misstatements of your correspondents Mazurie and Bon Ami in the last issue of FOREST AND STREAM, I should pass by your own captious but considerate article in issue of March 13, as I know FOREST AND STREAM has an honesty of purpose, and exerts a wholesome, healthy influence on the public mind which should command the respect of its readers, even though their opinions may be at variance.

I have always taken a deep interest in our furred and feathered friends, and for forty years have been familiar with our game, its haunts and its habits; and in my love of legitimate field sports and interest in honest, earnest, consistent "game protection," I yield to none; but protecting for a few to the exclusion of the many is not honest, is not earnest, is not consistent, is not American.

Taking first FOREST AND STREAM'S instructive exposition of "rights and privileges," with due deference to its high position and unlimited resources for information, yet I can see no parallel—no ground for comparison—between the healthy game legally possessed and the diseased cattle condemned by the State veterinarian. The one adds to the wholesome food supply and furnishes a luxury to that class of indoor workers who lack the time, the skill or the plethoric pocketbook of the "gentleman of leisure," but who nevertheless might enjoy from the market that which his more fortunate neighbor had the means, the time, the opportunity and the skill to obtain. The other endangers the public health and is justly condemned. The farmer's "rye, his corn and his potatoes" are taxed to raise a necessary revenue and abate a public nuisance. Can you put game in the same catalogue, and subject it to the same restrictions for like reasons?

Certain plans, forms and specifications must be submitted before the granting of building permits in our cities, as otherwise the rights, privileges, pursuits and pleasures of others would be interfered with and the public safety endangered. Will the public health or individual rights and privileges be endangered to a greater extent from the sale of the legally possessed game by the needy pot-hunter than by its gift by the more fortunate wealthy sportsman? Will the game supply suffer more from the sale of twenty than from the gift of twenty times twenty?

This antiquated cry of "75,000 strong" and threats of "political slaughter" because a public servant uses his prerogative for the public good is sickening to the senses, and should have died at birth. From a slight personal acquaintance with our Governor, I believe him fully competent to defend his own position, and further, that outside of the wealthy organizations he has the hearty indorsement of the great majority of the people of the State. In their zeal and interest in the great, much-talked-of 75,000, Mazurie and Bon Ami forget the great millions in the State who are as much entitled to consideration as the little thousands who are asking for "special rights and privileges." Which is the better sportsman and the more considerate, consistent game protector—the poor pot-hunter (?) who legally kills 100 ducks, grouse or woodcock in a whole season's shooting, and from sheer necessity sells them to supply his family with the necessaries of life, or the wealthy club member or yacht owner who kills five times as many in a morning's shoot and gives them to his friends and companions? I have spent many months, and even years, afield with all classes of gunners, from the "yaller dorg" biped to the kid-gloved gentry, and find human nature much the same whether encased in homespun or corduroy, and have found men of noble character and generous impulses and big bank balances to their credit, but as many such among the lowly who were compelled to sell their game to pay for the luxury of a day in forest and field. I have met an occasional game hog, but never the "pot-hunter and his yellow dog, that gets ahead of the town sportsman and pot-pies whole coveys on the ground." But if I ever am so unfortunate as to meet him I shall expect to find him encased in a dude suit of corduroy and find his game hanging in the city market soon after he reaches home.

That "field sports were made for a gentleman's recreation" is a revelation to me. I had always supposed that they were made for high and low, rich and poor, all alike; but if they were made for the gentlemen, then I cannot blame the gentlemen for asking special legislation for what they claim as their own.

Bon Ami infers that because in the legal season I handle legitimate game, I am therefore a "game dealer" and not a merchant. Bon Ami in the course of legitimate farming buys, sells and exchanges ducks, geese and chickens. Is he then a poultry dealer in the sense that the term would imply? I am "not pleading ignorance in justification" of the grounds I have taken, but I like to see a subject treated fairly, and since Bon Ami professes such an intimate knowledge of my business life, I will ask him if he remembers, during the time we could almost claim to be neighbors, the fish and the game I introduced, fed and liberated, almost wholly at my own time, trouble and expense, and whether he at the time or since has lent a "helping hand" in the same direction? His deductions as to my estimation of the "farmer's boy" are irrelevant, as I have nothing but kindly feelings and words of praise for the sturdy sons of my early associates; but still I am bigoted enough to believe that not all the good comes from the woods and the fields, and that there may be other boys their equal in everything that goes to form the foundation of manly men.

The fortunate class who can enjoy shooting privileges at their pleasure, who invest small fortunes in club memberships and shooting preserves, are continually deriding the poor and less fortunate class of gunners, who from grim necessity must occupy a lower sphere.

Oh, consistency, thou art a jewel! but "market-hunters," "pot-hunters," "true sportsman," who are thy possessors?

W. W. MCCAIN.

DELAWARE COUNTY FISH AND GAME PROTECTIVE ASSOCIATION, Chester, Pa., March 19.—*Editor Forest and Stream:* I read with much interest the manner in which the "Baldwin bill for the appointment of a game and fish warden" in the State of Pennsylvania was championed in your last issue. The writer is anxious for extended publicity of the bill, and I hope his wish will be complied with and its readers dissect the measure with ease.

My opinion of a warden is that he should be an officer that must give his entire time and attention to his work, patrol the streams and forest in the same manner as a policeman on the street. His place of duty should be in the locality where the violations take place, and not sitting in an easy office 100 miles away. To successfully prosecute violations of the fish and game laws, and have the proper evidence, is to arrest the violator while committing the act, and not wait for some citizen to inform the high chief, who sits in Harrisburg, 100 miles away, that such and such offense was committed in Delaware county. He thinks it over, and may send some one to Delaware county to look the case up. Time passes on; the violator does away with all forms of evidence that could be used against him, and defies any one to prove that he violated the law.

The trouble with our Fish and Game Commissioners has been that they never could get an appropriation large enough to successfully carry out the warden service. They have had to depend entirely on men who served without pay, consequently the men appointed were wardens in name only.

The "Baldwin bill" proposes to successfully prosecute all violations of the fish and game laws with an outlay of $6,000. If they would tell me that they were going to dethrone the Queen of England with that amount of money I would have just as much faith in their doctrine.

The bill provides for three deputies in each county, who are to be paid by the county Commissioners, but fails to state what they are to receive or how they are to receive it. It also fails to make the Commissioners provide compensation to pay them with.

From the fact that the local wardens are supposed to chase up the violators, arrest, and secure evidence for their conviction, it seems to me that they are the most essential part of a successful warden service, and should be provided for in the bill in terms that would insure them a just compensation for the services rendered. Until local wardens can secure compensation that will permit them to devote their time and attention to the work our condition will not improve.

It does provide $1,800 for the main warden and $3 per day for ten deputies. I would like to ask every fair-minded man what use ten deputy wardens would be in securing the conviction of the fish and game violators in this great State of Pennsylvania? I never like to make a statement that is not based on facts, but feel that I am safe in saying that I believe this bill is for the sole purpose of furnishing protection to some secluded spot in our State which is controlled by either an individual or an organization. It has the appearance of a deeply-laid scheme to protect some particular stream or game reserve at the expense of the whole State, while the balance of the State must suffer.

How easy it will be for this chief warden to sit in his cosy office at Harrisburg and appoint ten deputies at a salary of $3 per day to go sit along the banks of a certain stream located in a certain place.

This bill should be defeated unless some means are provided to maintain local wardens at a compensation which will be a fair return for the services rendered. No man is going to lose time, sit up at night, take rebuffs, abuse, etc., which he would receive in the performance of his duty, unless he is compensated for it. As I stated before, the successful operation of a warden service depends entirely upon the faithfulness of the local men, who are on the ground and can make arrests when the violations are committed. I would much rather see a bill appropriating $1,800 for warden service, to give eighteen men $100 each, than to see the Baldwin bill become a law.

W. LEVIS BURK.

The Platform Plank.

NEW HAMPSHIRE.—The Platform Plank of FOREST AND STREAM seems to be growing in favor in different parts of the country. I am so situated here that I have a good chance to note the supply of birds, particularly grouse, in this section, and I do not remember a winter when I have seen so few birds as during the past. There is plenty of good cover and abundance of food, but the birds are gone, and I am confident that we want such a law as proposed by FOREST AND STREAM.

C. M. STARK.

Experience with Mongolian Pheasants.

SEATTLE, Wash.—The oddest result of a shot that I ever made was under the following circumstances: My friend Mr. Thomas H. Downing, of the well-known firm of custom-house brokers in New York, was shooting with me on Protection Island in the Straits of San Juan de Fuca. The island is stocked with Mongolian and golden pheasants, contains about 300 acres, and is preserved. We had been shooting a couple of days, no one else having shot there for some weeks, and were going home through a point of woods on the edge of a high bluff just about dusk, when a Mongolian cock rose at my left at the edge of the bluff, and about a dozen yards off. I gave him one barrel and saw him fall on his back, flutter a moment, and that was his end. As there was a barbed wire fence and a dead pine thicket between the bird and us, and as the dog had gone on some distance ahead, I handed my gun to Mr. Downing, marking with it where the bird fell, and went around the thicket to pick up the bird. When there where I had marked the spot, I found not a Mongolian cock, but a golden cock pheasant shot dead, but stone cold, though evidently killed that day, as his bright yellow eye shone clear! Beating the brush thoroughly, I could find no trace of the Mongolian that I knew I had shot, and after a long search I was giving it up and coming out, when at my feet I saw a bronzed ring-neck shot dead, and also stone cold and stiff! To shoot at one bird and bag two others in this manner I guess must "beat the record."

Is there a harder bird to kill than an old Mongolian cock pheasant? I have shot all sorts of birds, from hedge sparrows to goshawks and from the least sandpiper to the tough old "honker," and my observation is that an old "ring-neck" will carry off more shot than any other bird. I have known one to take a full load of No. 5 shot, driven by 4drs. Schultze powder at 40yds., set his wings and sail out of sight. I have seen a similar shot under similar circumstances apparently take effect and the bird lie dead till the dog reached him, when he flew, to be knocked down by a charge of BB and 4drs. of Schultze, and even then he tried to get away. One cock that I killed had half a dozen No. 5 shot embedded and encysted in his breast close to the bone, which had been penetrated by one shot. As for running when wounded, I saw a hen run at least 200yds. with broken leg and wing, and we found that she was running on a stump at that, the lower leg having been shot clean off.

X. Y. Z.

The Flooded Districts.

OSKALOOSA, Ia., March 29.—We are having high waters all over this part of the country and of course we are having a high old time with the ducks. While there are not so many as there were in days gone by, there have been a great many killed, and unless spring shooting is done away with the time will soon come when there will be no ducks.

J. W. F.

LITTLE ROCK, Ark., April 2.—The terrific flood in the Mississippi has played havoc with the game in the bottom. The negroes driven out by the flood are living on the deer and turkeys in the same fix, and much of the game has been drowned. It will take five years of dry weather in that bottom to overcome the effects of this flood.

ST. LOUIS, Mo., April 3.—The abnormally high waters continue and the great States of the Southwest are as water-soaked as a full sponge; every rain, and they seem without end, rapidly rushes to the rivers, which now are at flood stage all over this section. Immense damage has been done, and in the game regions of southeast Missouri and along the Mississippi River in Tennessee, Arkansas and Mississippi the destruction of game will be enormous. It was not an uncommon sight for railroad engineers to find their tracks covered with game which had fled there to escape the flood, but even railroad embankments are now covered and the game will probably be destroyed. While the floods have been destructive in this direction, they have put a stop to all fresh-water fishing, and there will probably be most excellent sport in this line when the floods subside, which will not be for some weeks to come. Every slough, lake and pond has been filled with water and fish have been able to ascend to all of them.

ABERDEEN.

Decoy Stories.—V.

JERSEY CITY, N. J.—Hearing a noise among our decoys while duck shooting last fall on Great South Bay, on looking we saw that one of our decoys was missing. The guide and I started to investigate, and saw that what he called a sea toad had one of our decoys in its mouth; the peculiar feature was that the decoy was being swallowed head first. In trying to drag decoy, sea toad and all to the boat (for we were wading with hip boots, the water being shallow), we ran afoul of the other decoys, when the sea toad let go, after which there was much lively kicking by the guide, for the sea toad was mixed up between his legs.

The guide said it was the largest one he ever saw, and judged it to weigh about 150lbs. He said that in all his forty years on the bay he had never seen or heard of such an occurrence.

He showed me a dead one that day as he was poling me through the thatches, as I did not get a good look at the one in the morning, for he cautioned me to keep clear of it; and if what he calls a toadfish or sea toad is not a brother to the octopus or devilfish, arms and all, then I wish some one would enlighten me on that subject.

I would like to know if this is a common occurrence, for I don't think it is or can be without it happening more than once in forty years to an old bayman as Selah Baldwin, of Seafords, L. I., is.

OTTO KEIM.

Mongolian Pheasants in Ohio.

CHIEF WARDEN L. H. REUTINGER, of Ohio, writes as to Mongolian pheasants: We are having excellent luck with the propagation of these noble birds. In our pheasantry at Van Wert, O., we have several hundred that are now beginning to lay. Last November we distributed 200 of these birds with the best results possible. We have just passed through a very rigorous winter without the loss of a single bird; in fact, they are in better condition than they were last fall, and if we have no bad luck we expect to distribute at least 800 birds next November. I find where we have liberated a few pairs of birds in this county in bad weather, or when the ground is covered with snow, they get into the barnyards of the farmers and feed with the chickens. As the weather gets warmer they do not frequent the barnyard, indicating that if they are liberated and treated properly they will stay on the farm on which they are turned loose.

The Grassy Lake Club.

Our Arkansas correspondent J. M. Rose writes: I inclose you a picture of the Grassy Lake Club house, made after the highest style of cane biting photography. The piratical-looking individual on the steps with the Burgess gun is the Rev. J R Howerton, now to our regret living at Charlotte, N. C. I can commend him to the brethren of the gun and rod as a Christian gentleman and a thorough sportsman. I cannot say much for his preaching, for he had a disagreeable and uncalled for way of jumping on my favorite sins. I must say that when he was after some other fellow's sins he was extremely interesting.

The Grassy Lake Club owed its origin to Dr. D. A. Gray, the secretary. He wove a Mayne Reid romance about a large herd of deer led by a monarch of the woods with branching horns that went down the mountain every day to water, turkeys that needed some one to kill them in self-defense, and ducks and geese that darkened the sky. Under these beautiful stories the club grew and prospered.

But the native love of truth that has so hampered me in my profession compels me to say that the only antlered animals I have seen were sundry sawmill goats, and the only turkeys blessing my vision were the exclusive property of Mrs. Thompson. But there were ducks and geese, as will be seen by a few of the former hanging on the porch, the fruits of a trip of the parson and myself to the lake that day. There may be that flock of deer up there. I have heard so, but all liars are not confined to the pages of Forest and Stream.

Above Grassy Lake lies Clear Lake, and we bought that also, fenced it, and have kept the pot-hunters with their nets out of it. The Government helped us stock the waters, and we hope for fine fishing this summer. The bass in the lake are quite large, the aforesaid parson holding high hook with a bass of something over 6lbs. I guess that is true, as he got a lady to certify to it.

Of course the big ones get away, but we strictly enforce the rule of no lying about the fish that got away, or the ducks that were lost in the grass. J. M. Rose.

Michigan Deer Killed for Lumber Camps.

Saginaw, Mich., April 2.—*Editor Forest and Stream:* A traveling man employed by us has just returned from a trip to the upper peninsula of Michigan and briefly reports the following:

"Most of the lumber firms logging in the upper peninsula have hunters out all winter to furnish their camps with venison. I found hunters at Atkinson, Florence, Beechwood and Iron Mountain, and learned that they averaged over a deer per day per man. At certain times, when there is a crust on the snow, they get from three to five per day. There seems to be a general understanding between the hunters and town people, as the latter are fully posted on what is going on."

Now I have reported word for word the report made by our salesman, and he further told me that he met one man who said that his average was about one and a half per day, and that he was hunting for one of the K. C. Co. camps. He seemed to make no bones about it.

If politics could be taken out of our game warden system I wonder if better results in the way of protection would be secured. Perhaps not. Probably our State game warden and his assistants do as much or more work than the salaries paid them warrant; but at the same time it does seem strange that a stop cannot be put to violations of the game laws similar to this. W. B. Mershon.

Maine March Hunters Punished.

If a few more offenders were dealt with as summarily as were three men of Andover, Me., it would act as a wholesome deterrent on other violators of the game laws.

On March 5 these men were seen entering the woods, and shortly after several shots were heard in quick succession. That evening the men hired a team, evidently for the purpose of hauling the deer from the woods. Sheriff Fred A. Porter was informed of these circumstances and commenced an investigation, resulting in the discovery of sleigh tracks in a logging road, which being followed led to a spot where the intestines of one or more deer had been thrown, with other unmistakable evidence of the crime. The men were arrested, and on being placed on trial, while the evidence was strong, it was deemed best to make a search of the house of one of them to prove the guilt of the accused beyond a doubt. The search resulted in the finding of eight deer's feet, with blood still on them, in a pile of sand in the cellar, where they had been buried.

As this was proof positive, one was fined $80 and costs and the others $40 each and costs, which, being unable to pay, they were committed to jail in Paris, Me.—"sadder but wiser men." A. L. Burns.

Sale of Game in Missouri.

St. Louis, Mo.—Some time ago Forest and Stream noted in its columns that a suit against dealers in game was begun in this city. I have not seen in your journal any account of the result of that suit, which ended in a victory for the game dealers. When the case came to trial the defendants made a plea that the law was unconstitutional, and even if it were not it was repealed by a law enacted some years ago.

The first game law legislation, the Missouri game law of 1877, contained provisions covering the possession and selling of game out of season. The law of 1895 repealed the law of '77, but did not have any such clause covering the illegal sale of game. The judge decided in favor of the defendants, and of course the use of game at hotels and the sale at storehouses is now wide open. It is stated that another effort will be made by the Game Protective Association to bring suit against game dealers on another issue, and a more favorable decision is looked for.

Aberdeen.

Rhode Island Wardens.

Secretary M. J. Flaherty, of the Rhode Island Association for the Protection of Fish and Game, has sent out to town supervisors this notice of the game constable law: "Chapter 112, Section 16, of the bird law says 'that every city or town council shall annually, in the month of April, appoint not less than one or more than four persons to act as game constables.' We respectfully desire to call your attention to the importance of electing your game officers in the month of April, as any other time would be illegal and would cause a great deal of annoyance in the interest of protection of game." It will be remembered that important prosecutions have failed because of a careless non-observance of the time of the provision respecting appointment of constables.

Snipe in West Virginia.

Central City, W. Va., April 2.—Though the season has arrived and the wetness of the ground favorable, few, if any, snipe have made their appearance, but some of the spring shooters are looking out for them. I understand that quail cannot be lawfully shot in this State for two years, so then sportsmen will have to come down on the long-eared quadruped to get much fun next fall. N. D. E.

Camp-Fire Flickerings.

"That reminds me."

The Tenderfoot's Bear.

Moccasin Bill was a famous Indian fighter, hunter and guide, living in Silver Cliff, Colo. Sportsmen coming from the East or England would hire Bill to take them hunting; and if they didn't kill anything themselves he would see that they took something home with them.

One day a young fellow came to Bill and said he would like to kill a bear. "Well," said Bill afterward, "I didn't think there was a bear within fifty miles; but I told the fellow I'd hitch up and we'd go up on the peak (Hahn's Peak) in the afternoon and see what we could do. We drove up a way and tied the team; he went up a gulch and I took up the middle of the hill, and I'll be blowed if I'd gone 100yds. before I ran plumb on to a brown bear. I let him have it where it 'ud do him the most good; and we skinned him and the young feller took the hide home with him. And, don't you know, that fellow thinks to this day that all you have to do here when you want a bear is to hitch up and go out and bag him." Walrod.

California.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in Forest and Stream.

WHEN THE ICE GOES OUT.

H. E. W.

When April skies are smiling
Through the mist of coming showers,
When the spearlike grass is guarding
The first young, fragrant flowers,
Then our hearts are filled with longings
And our thoughts are all about
The tempting lakes and brooklets
When the ice
Goes
Out.

What matter if the breezes
Should wildly rage and blow,
Or the air be moisture-laden
With the woodland's melting snow.
The chill winds have no terrors,
And our only anxious doubt
Is that we may fail to be there
When the ice
Goes
Out.

So we gather up our tackle
And we feast our hungry eyes
On the omnipresent hackle
And our treasured "fancy" flies,
Which in our dreams we cast before
The wily, wary trout;
For we'll all start off a-fishing
When the ice
Goes
Out.

Portland, Me.

MASSACHUSETTS TROUT.

Boston, April 3.—Brant shooting at Monomoy is rather uncertain this season. A few have been taken and they are mainly young birds. Mr. Warren Hapgood, now over eighty years of age, with Mr. Walter L. Hill as his guest, started for Monomoy on Wednesday. With four or five other gunners they make up the second brant shooting party of the season to Monomoy. Mr. Hapgood, for so many years secretary and treasurer of the Monomoy Brant Club, gave up the office last year, feeling that a younger man should do the work. He is determined to make his annual visits, however, as long as he is as hale and hearty as he is to day. Last year a skunk, shot in a trap, was the only brant either he or Mr. Hill got. This year they expect better sport, though the washing of the sand has destroyed a part of the brant feeding ground there.

The trout season opened in Massachusetts on April 1 with rather more than the usual amount of enthusiasm on the part of the club sportsmen and owners of private waters on the Cape and elsewhere. The weather was fine; it had been fine for many days in fact. There has been very little snow during the past five or six weeks, and the streams were generally free from roil and snow water on the opening day. Good reports have been very quick about coming in, and many sportsmen will follow these reports; as a guide once remarked to me, with a twinkle in his eye: "They are fishing to get the big trout you caught there yesterday." The first trout of the season was seen in Appleton & Basset's window on the opening day. It was a good one, and no April fool. It came up early from the Cape and drew quite a crowd of admirers. Messrs. L. R. Howe and R. B. Blodget brought up from their preserve, in Plymouth, a very handsome basket of trout Friday. Some of the fish went as high as 2lbs., and were all remarkably large for Massachusetts waters. These trout are positively wild trout, and by no means liver-fed. The Monument Club members are a number of them at their preserve, or had not returned this evening. The weather has been fine, and reports say that their sport is unusually good. The Tihonet Club members are also well represented at their preserve on the Cape, with some good fish already caught, though the club members will generally remain over Sunday. E. H. Wakefield, Jr., Edward Brooks and R O. Harding left to day for fishing at a preserve controlled by these gentlemen between Bourne and Monument. They are to fish two or three days, and with the weather as good as it has been for each day since the opening, they will take some creels of trout that will excite the envy of the less fortunate. Mr. Howard Stockton is at Monument fishing. Col. Horton is also fishing in the same direction. He is a salmon fisherman also and a member of the celebrated Restigouche Club. W. K. Churchill and C. S. Anthony are fishing a preserve in Sandwich. Cranberry bog stream and pond fishing is proving to be very popular with Boston sportsmen The owners of the bogs are also particularly interested, allowing their men to keep guard and prevent poaching. They are interested not only for what the sportsmen pay them, but they have a notion that the trout destroy the larvæ of the insects that are destructive to their berries.

Waldron Bates and G. Gorham Peters are at their trout preserve on the Cape, or were at the date of this writing. The Tihonet Club people have been at their preserve for some days, they include Mr. J Russell Read, Mr. Shattuck and several others. Good fishing is reported. The Boston & Maine Railroad is already awake to the possibilities of the coming sporting season. At the window of the ticket office, on Washington street, they have a fine specimen of a brook trout, mounted by Crosby, and weighing, before mounting, 8½lbs The specimen is the property of S. B. Gates, Presque Isle House, Aroostook county, Me. Special.

In the Connecticut Legislature.

Editor Forest and Stream:

An editorial in your issue of March 27 so thoroughly represents what I have advocated to the General Assembly of this State for the last three sessions that I feel inclined to offer your readers some brief comment. I am not alone here in Connecticut in support of the "uniform code" advocated by that grand representative of the American sportsman, Mr. Charles Hallock; our present Commissioners of Fisheries and Game are ardent supporters of such a code. Three men of rare judgment and keen interest in their work are Messrs. Williams, Collins and Bill, and our genial Governor showed rare judgment in reappointing them for a second term. Nor do I and others forget the generous support accorded to our bill to remodel the Fish Commission into a Fish and Game Commission, by the Hon. O. Vincent Coffin and his friends in 1895.

But when you enter the legislative branch of our State government you find a condition vastly different. The State Senate has generally been fair in dealing with these questions, and seems willing to correct or modify bills not in accord with its judgment rather than kill them outright; but in the House all is different. A bill of importance will produce a scene that is unparalleled by any class of legislation. Let it be known that the bill is advocated by city sportsmen, and it will be riddled by amendments and finally indefinitely postponed. A proposition to change our trout law by cutting off two weeks of early fishing and adding two weeks in July, so as to encourage more fly and less bait fishing, was met by a storm of abuse; one to stop snaring on one's own land was used in the same manner, notwithstanding the recent decision of the Supreme Court that no person had a qualified right in game birds, and that they were public property.

A bill to permit the Commissioners to make special regulations concerning inland waters stocked by them, and to make uniform our special laws and post such laws and regulations on the shores of such waters so a stranger might know what they were, was stamped as the most "audacious piece of legislation ever proposed;" and then, to wind up with, the "farmers" have served notice that they do not believe in State hatcheries (except for shad), and will cut the appropriation for the work of the Commission down where it will probably do little good. Such is the situation here, and if any person in Connecticut thinks I have misstated it let him reply through your columns. We have a representation here in Connecticut based upon the number of acres in a township and not upon the population therein. Can we look for anything better in the future? C. W. Hall.

March 29.

Moosehead Lake Association.

Greenville, Me., Moosehead Lake, March 29.—*Editor Forest and Stream:* Yours of the 5th inst. was received just as I was starting on a snowshoe trip up the lake and have not been able to reply until now.

The Moosehead Lake Protective Association has been formed here for the purpose of mutual protection of the interests of the guides who ply their vocation in this region, and who constitute the largest proportion of the membership, to foster the summer travel to this locality, and also to act in a concerted manner in affording protection to fish and game when protected by law, and looking to the enforcement of all fish and game laws, and the enactment of such as are beneficial and practical.

Under the new law all guides are required to take out a license. We shall endeavor to see that no alien is given a license, or in fact any one who is not reliable as a canoeman or woodsman. Many guides come to Maine each season from the Provinces. They have no respect for our laws and allow many so-called "sportsmen" to wantonly kill game out of season. They guide for a year or two, and then are seen no more. We desire to put a stop to such work. We also propose to formulate certain rules under which all parties are to be guided, tending to correct abuses on both sides which have crept into the relations between us and our employers, hoping to make such relations more cordial and satisfactory.

Mutual improvement will not be neglected, and our aim shall be to lay hold of all that is elevating and instructive in the great domain of nature, to whose heart we are so closely drawn as woodsmen. Edgar E. Harlow,

Sec'y Moosehead Lake Protective Association.

Black Bass Caught Through the Ice.

Some time ago I noted in your columns a question as to whether black bass would take bait through the ice in winter. I can answer this with a very positive "They do." In Fisher's Lake in southern Michigan, when a boy, I caught black bass by fishing through the ice; live bait was used, and while fishing was best during the spring, black bass were caught the whole winter through. They were not dormant by any means, as was frequently demonstrated when biting would begin on one side of the smaller lake, and as the fish moved onward there would be biting over the whole grounds for an hour or so, or until the schools had moved off. This lake, however, was fed by springs, which may account for the activity of the fish. Besides black bass there were caught pickerel, yellow perch, white bass, and occasionally a rock bass or sunfish. I remember catching one sunfish at the depth of about 40ft. Aberdeen.

MEN I HAVE FISHED WITH.

XXXVIII.—Alvah Dunning.

ONLY men who possess strongly marked personalities are capable of making strong friends and as equally strong enemies. The truth of this has been well shown in the replies to letters asking for information about the old woodsman who is probably the oldest of Adirondack guides. Carefully sifting these replies, it seems that Alvah is well liked by sportsmen whom he has served, and by a few dwellers in and around the great region of mountains and lakes which comprise about one-third of the great State of New York. Others dislike him, and among Adirondack guides he is, for some reason, the most unpopular man in the woods. To me any old man in the woods is interesting, and as individuality crops out more strongly in men who have never assumed the mask of civilization, we will try to see him with unprejudiced eyes.

Alvah will be eighty one years old next June. He is tall, spare and wiry. A look at his picture, taken a few years ago by Stoddard, will show that his strongly marked face is full of character, grit and determination, and it looks like a face that could not be developed outside the woods. You can see that he dressed himself before he would pose for Stoddard, and that his new hat must be "taken" at all hazards. That is not the hat that the old man would wear when tracking a deer or poking through the brush up a stream to observe where the otter "uses." This proves that Alvah is really human and has his vanities as well as the rest of mankind.

It was in 1865 that I first met Alvah and fished for trout with him in the Brown Tract Inlet and Racquette Lake. I was then regaining health after a long struggle all summer, and a couple of weeks with Alvah put on the finishing touches.

The old man—he was "old" to me then—took good care of me, and I returned much improved. His talk of woods life was very entertaining, and it was only a few weeks afterward that I became acquainted with his mortal enemy, Ned Buntline, also a fishing companion, so that I got Alvah's story while it was fresh. Friends of each man have so mixed up the case that it resembles the histories of Bonaparte as written by a French or an English pen.

Although these sketches appear in the columns of 'Sea and River Fishing," there has been no attempt to tell fishing stories; the idea of the writer being to sketch the characters of men with whom he had incidentally fished; and if upon any occasion he had sat upon one end of a log for ten minutes with a man who was fishing on the other end, then the other fellow was his victim for sketching as one of the "Men I Have Fished With," and his pen-portrait published so that his individuality might stand out, if the pen was able to make it prominent.

Therefore my trouting on this trip is skipped and the man is taken up. Said he: "These woods is a-gittin' too full o' people fer comfort—that is, in summer time; fer they don't bother the trappin' in the winter; but they're a-runnin' all over here in summer a-shootin' an' a-fishin', but they don't kill much, nor catch many fish; but they git in the way, an' they ain't got no business here disturbin' the woods."

"They pay you well for working for them, don't they, Alvah?"

"Yes, they do, durn 'em; or I wouldn't bother with 'em; but I druther they'd stay out o' my woods. They'll come anyhow, an' I might as well guide 'em, fer ef I don't some un else will, but I druther they'd keep their money and stay out of the woods. I can make a livin' without 'em, an' they'd starve to death here without me. They're the durndest lot of cur'osities you ever seen; know more about guns an' killin' deer than any man in the woods, but when it comes to fishin' tackle you'd oughter see it."

This talk occurred after we had fished several days and had looked over the otter "uses" and other interesting things to be found in the wilderness, and the old man's remarks seemed to be so severely personal that they provoked me to say: "I am very sorry to have disturbed you, and will go back home in the morning."

The old man looked up and said: "I didn't mean you; 'cause you seem to know how to sit inter a boat an' to know the voices of the birds an' how to fish. Now don't you go an' take a meanin' outer my words that I didn't mean."

"All right, Alvah! But if these people don't kill much game or fish they can't disturb you much, and I'm a little curious to know why you object so much to their coming here. The woods belong largely to the State, and they certainly have the right to come into them." This had the desired effect; it made the old man angry and drew his fire.

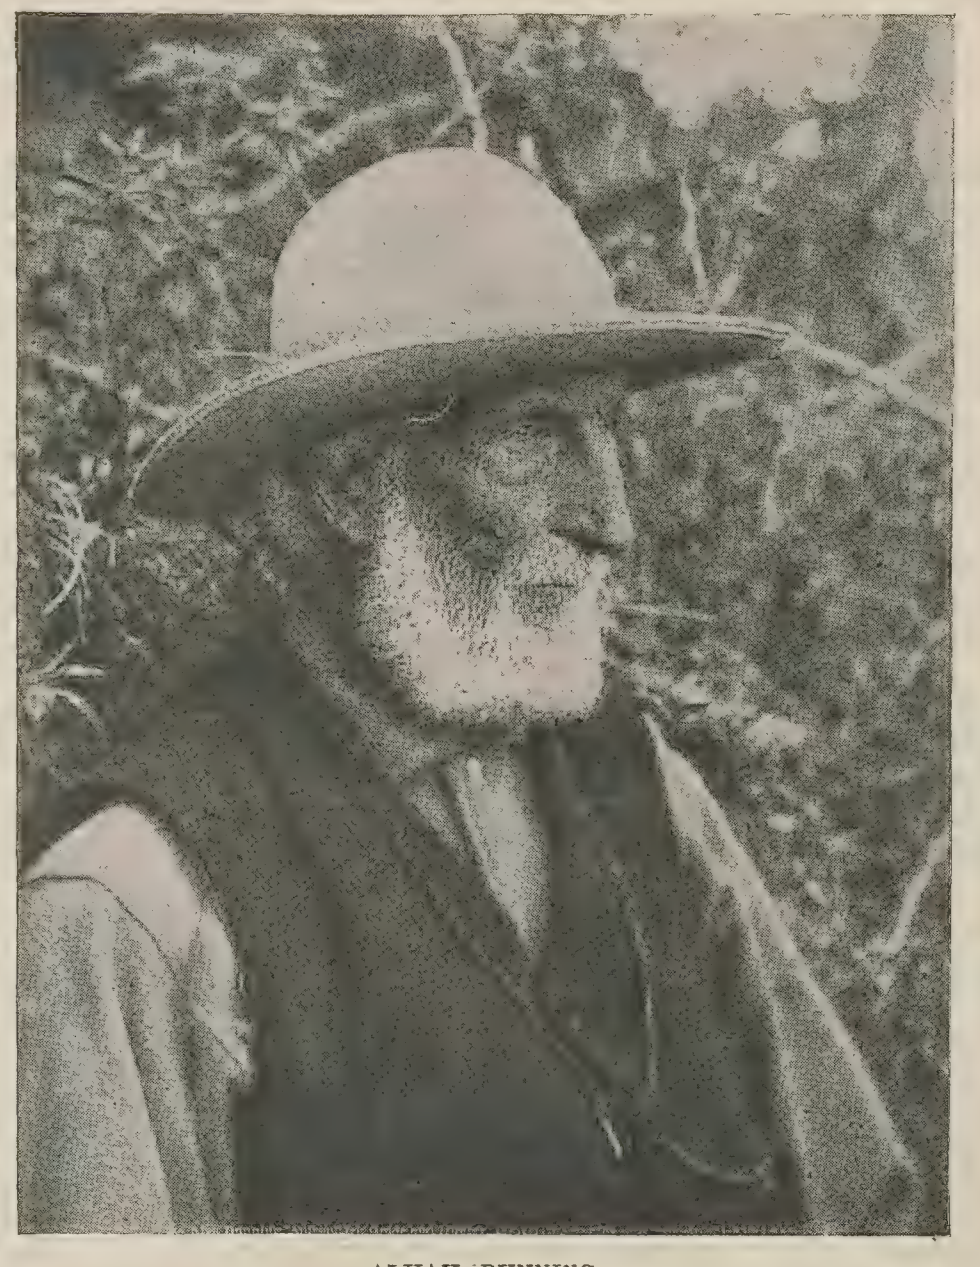
"Yes," he said, after turning the thing over in his mind in the deliberate manner common to men of the woods, "that's the worst of it; they've got a right to come here and disturb men who've made their homes in these woods all their lives, and many of 'em 's fools. I hate fools, don't you?"

Here was a chance to classify fools and to quote Touchstone: "I met a fool in the forest;" but that course might not have drawn the old man out, so I simply said: "I dunno, why?"

"Oh, they pester one so. A few years ago one came up here and tried to make me believe the world is round and turns over upside down in the night, and they all believe it, all of 'em, every durned one that I've spoke to about it. What d' ye think o' that?"

"I think they're wrong, of course, for we can see that these lakes don't spill out in the night. Yet this world can't be as flat as a pancake, for here are the mountains which disprove that, and as for turning over —"

"You don t believe it?"



"Not a word of it!" And we were friends.

When we met again in 1882 he recalled the trip, and at his camp on Racquette Lake he said: "Times is different now, an' wus. In them days nobody said a word if a poor man wanted a little meat an' killed it, but now they're a-savin' it until the dudes get time to come up here an' kill it, an' some of 'em leave a deer to rot in the woods, an' on'y take the horns ef it's a buck, or the tail ef it's a doe, just so's they can brag about it when they go home, an' they'd put me in jail ef I killed a deer when I needed meat. I dunno what we're a-comin' to in this free country."

There was nothing to be said on this subject and I said it. When dinner time came he called me from the lake, and as we two sat at table said: "There's some cold boiled ham and here's a stew o' mountain mutton. Mebbe it's agin your principles to eat our mutton in June, so I sot out the ham. I'm goin' to eat the mutton, you can do as you like."

Ham can be had at any lunch counter. The deer had been killed, and a refusal to eat a portion of it would not restore it to life. Writing of it at this late day recalls Wilmot Townsend's picture of the flight of fourteen ducks and the query below: "Where would you hold?" The Lady or the Tiger?

While Alvah is unpopular with many of the modern woodsmen, he has warm friends, and this proves that he has sterling qualities in his manly make-up which are overlooked by those who revile him as "an old pot-hunter." In the mass of letters from men who know him this term occurs three times and proves the statement that begins this biography. Alvah Dunning still lives and is well worth a visit from any man who loves to study a type of man which is rapidly passing. Mr. Charles H. Bennett, the well-known Adirondack host, now of The Antlers, on Racquette Lake, takes it upon himself that the old man shall be cared for in the winter; and Mr. J. H. Higby, who runs the summer camp on Big Moose Lake, also keeps an eye out for this last of the old-timers of a period before the Adirondacks became a fashionable resort.

ALVAH DUNNING.

From photograph, copyright, 1891, by J. R. Stoddard.

Forty years ago Alvah and one of his brothers visited relatives at Albany, Ill., and his brother died there. That one visit satisfied Alvah with the outside world and he returned to Lake Pleasant, and since that time he has never been outside of Hamilton county, N. Y., where he has lived by hunting, trapping and guiding. The younger generation are disposed to crowd the old man out of the woods on account of his following his belief that game is free at all times to those who need it and that the State has no right to pass laws concerning it. In conversation with me, my old friend and guide E. L. Sheppard ("Jack") said: "I have known Alvah for thirty years, and he is an affable, hospitable man of the old style, all of whom looked on game laws as infringements on the rights of men who live in the woods. He is the last of a type that has passed. He kills a deer when he needs it, catches a trout out of season to bait his trap, firmly believes it a sin to kill wastefully, and destroys less game than many who cry out against him." There you have the opinion of one of the best of the Adirondack guides, as well as a picture of the man.

Mr. Bennett, of The Antlers, tells me that Alvah will not write any more, but in a recent interview with him he got the following from Alvah: "In 1858 Ned Buntline came into the woods to get away from civilization and write novels. Ned built a cabin on Eagle Lake which he called Eagle's Nest and hired Alvah to work for him. They quarreled and Ned killed Alvah's hounds and they threatened to kill each other. In 1865 Alvah built a camp on Racquette Lake, where he lived alone, trapping, drawing his fur on a hand sled fifty-five miles to Boonville and bringing back provisions. It took a week to make the trip. One winter his skins of otter, fisher, marten, mink and bear brought him $743. In 1874 his camp on Sunny Island was burned and he lost everything he owned. That fall he built a camp on Eighth Lake, Fulton Chain, to get out of the way of travel, but in a few years returned to Racquette and built at Brown's Tract Inlet, where he now lives, a much disgruntled man, who says the people are wandering all over and spoiling the woods. Fifty years ago the Adirondacks was indeed a wilderness known to but a few sportsmen. There were but few boats in it and no mode of travel except by water. Here Alvah Dunning lived, hunted and reigned supreme in 'his woods.'"

Alvah's father was also a hunter, and in 1804 moved from Vermont to Lake Pleasant, in Hamilton county, N. Y., where Alvah was born a dozen years later. If there is anything in heredity Alvah had the advantage of it, for his father was not only a trapper, but also a noted Indian fighter under Sir William Johnston before and during the Revolutionary War. Shortly after that war a few men were in a village tavern talking over Revolutionary exploits when an Indian—of whom there were several in the company—boasted of having committed a particularly atrocious murder of a young white woman who had lived in the vicinity during the war. Dunning caught up a bundle of traps that lay near him and crushed the Indian's skull by a single blow. He was tried for his life and acquitted. With such a father and such an environment, the younger Dunning naturally became a perfect woodsman.

Rev. Thomas G. Wall, D.D., of New York city, to whom much of the information in this sketch is due, says: "Dunning has lived like an Indian, and forty years ago he looked like one, and is a very close imitation of some of Cooper's models—silent, stealthy in movement, full of resources; he could almost speak the language of the animals. I have seen him, by a peculiar chipper, call a mink from its hiding place in the rocks and shoot it, and have known him to bring a deer back into the water by bleating and making the noise of wading. Dunning was a true sportsman, never allowing more fish or game to be taken than was needed. He was employed by our party in 1856, when I first met him, and I have been with him many times since, and always enjoyed his society. Indeed, his excellence, when in his prime, was so generally known that it excited much of the enmity with which he was regarded by some, for if he could be had he was always first choice."

When I met Alvah the last time—some half dozen years ago—he was living in the past. The future had nothing in store but the destruction of the forests, or, what was as bad, their being run over by tourists or the building of expensive "camps" by wealthy men. The good times were in the distant past, when he never saw a strange face unless he went into the settlements. "They're puttin' steamboats on the lakes to scare the trout to death, an' have built a railroad into Old Forge. They've put a lot o' black bass into Racquette Lake to eat up the few trout that's left; an' what good anyone sees in a black bass is more'n I know."

To encourage him to talk, I said: "The black bass is a gamy fish—not as gamy nor as good for table as a trout—and I suppose they thought 'em better'n no fish;" and so I excused the crime of putting bass in Adirondack waters just to see what Alvah would say.

He said: "They ain't a bit better than a sucker out of a cold brook, either to eat or to bait a trap and as for game—well, I fish for fish when I want 'em, an' don't fool away my time playin' a trout, lettin' him run off an' then reelin' him up just to see the pole bend. When I hook a fish I use tackle that will stand it and bring him in 'thout watchin' his fightin' qualities, but I show him some of mine if he's got time to think about 'em afore he's my fish. No, sir, them black bass is the worst thing they could have put in these waters—worse'n pickerel, for the young pickerel can be eaten by a trout because his fins are soft, but these bass are like big sunfish, and not a bit better."

The old man was not far out of the way in this matter. He had watched the new fish, and sized them up in his own fashion. The State Fish Commission had put the fish in the waters—or rather Seth Green did it in the name of the Commission, for in that early day he ran the work as he pleased—but the result was a howl, and a law was passed restraining the Commission from planting certain fishes in Adirondack waters.

About this time there was a discussion in the papers as to the scream of the panther, as the North American cougar, or puma, is called in the East, and while I was positive that I had heard one when a boy I wanted the opinion of the old woodsman, and as he was baiting his hook I said: "Some people say that a panther screams and others say it never does. What's your opinion?"

He unhooked a trout and replied: "A panther is like a cat, hunts like a cat, always still. Now a cat is a silent animal and never makes a noise unless it wants something. A dog will bark just to hear his own voice, but a cat 'll lie around the stove for a week and never make a sound unless it needs something. If it's hungry it may meow a little just to let you know it, but that is different from a mating call. Now, when the panther wants to find one of its kind it can get up a good loud screech. It's got to, for they ain't plenty and that call has got to go miles through the woods. Yes, they can put up a good stiff call for a partner when they want one, but they don't do it often A man might be in these woods a hundred years and not hear a panther call more'n half a dezen times. They don't do it often and they are never plenty, like deer and bears."

"How long since there were any wolves in the Adirondacks, Alvah?"

"Wall, I don't just know azackly. When I was a boy they was common an' you could hear 'em howl o' nights along the lakes or up the mountains, an' we used to shoot 'em an' trap 'em, but never did no p'izinin', like the' do out West. Let's see! They was plenty up to about the time Gineral Taylor died. When was that?"

'That was in 1850."

"The wolves went off about that time; some said they went into Canada an' some thought they died. I guess if they'd a died we'd a seen some o' their bones som'ers, but a few was around here durin' the war, in the 60s, an' I killed a big one then, but ain't seen none since. Some men say they've seen 'em o' late years off toward the Saranacs, but I can't say. While the war was goin' on there wa'n't so many men comin' to the woods an' things picked up a little."

Last fall the New York *Sun* published an account of "the last Adirondack moose." According to the writer of it the

moose was killed by Henry Wiley, of Salisbury, Herkimer county; Frank Faville, of St. Lawrence county, and Jed Thompson, now dead. It was early in the winter of 1858, and the game was killed between the Canada lakes and Pleasant Lake after a long chase of two days, and the writer says that a moose had not been killed in the Adirondacks in twenty years.

The fact is that Alvah Dunning killed the last Adirondack moose in March, 1863. I did not correct the writer in the *Sun*, although disposed to do so at first.

"When I was a boy," said Alvah, "moose was plenty in these woods. Once father an' I killed five in one day, an' hauled the most o' the meat on sleds to the settlement an' sold it."

When the last moose was killed Alvah and Ben Batchelor were following a wounded bear that the former had shot the day before. They found the bear and killed it and then came upon the track of two moose, a bull and a cow. They killed the bull that day and followed the cow all the next, and killed her just at nightfall. Perhaps it's just as well; for it is doubtful if one moose would be left a year from now if a hundred were turned loose in the Adirondacks. The size of an animal increases the desire to kill it, in most men, but between ourselves I would prefer to kill a woodcock, or a grouse on the wing, to dropping several hundred pounds of meat in its tracks.

Dr. Wall asked Alvah how many moose he thought he had killed and the old man answered: "Oh, I don't hardly know, never kept any count, but I guess nigh on to a hundred." And then he told how on one of his early moose hunts he had got separated from his father, killed a moose about nightfall on a cold night, had no matches and rolled himself in the warm skin and slept, to find himself frozen in at daybreak.

Writing of Alvah Dunning brings a desire to spend a month in his cabin, jot down his stories and make a closer study of the most interesting man now living in the Adirondacks. We all look back on wasted opportunities, and while enjoying his company I never thought of taking notes for the purpose of writing him up. The man who approaches Alvah Dunning in the right way will get his confidence and enjoy it, but his opinions of the revolution of the earth on its axis, and of the injustice of the game laws to woodsmen, are too firmly fixed to be meddled with. Let the old man alone, wink at his killing a deer when he needs "mutton," or a trout when he wants to vary his diet, if he lives for twenty years he will never do as much harm to the fish and game of the woods as some of the so called sportsmen. He does not float for deer on summer nights and kill the first thing that his jack-light shows has a pair of shining eyes, whether buck, or doe with fawn by her side. If he needs "mutton" in summer he prefers a buck to a nursing doe.

Young men, some little concession—charity, if you will—should be extended to this man who was born in the woods and considers it his by right of prior discovery and settlement years before you were born. I would be the last man to tell the story of mountain mutton if Alvah cared about it. I saw no hide, hoofs nor horns, and under oath I do not know of what I partook further than it was good meat. The game laws are all right, but no right-thinking man should use them to oppress the old hunter whose only larder is the woods in which he was born a steward. Sock it to me if you catch me, or to any other man who pretends to shoot or fish for sport, violating those wholesome laws which are made for our benefit and which it is a crime for us to violate, but the strict letter need not be enforced on the man whose whole life has been spent in a struggle for existence in the forest, and who could not live out of it. Put yourself in his place!

FRED MATHER.

FISH AND FISHING.

THIS is the season when the mystic bond of sympathy among anglers manifests itself at every opportunity, and a frequent method of salutation is: "Hello! Got your fishing tackle ready?" or "How are you? Going into the woods this spring?" A long pre-existing friendship between anglers is not always requisite to bring out such a greeting. The fact that each knows the other to be a true sportsman is sufficient, being a guarantee that they are mutually worthy of recognition and that the topic introduced is one of common interest.

It may be a little early yet to inspect your rod, reel, lines, hooks, flies and other fishing appliances; but nevertheless you feel like doing it, and if you yield to the impulse it is not strange. You may be sure there are others who are experiencing similar sensations, and, giving up as you have done to inclination, are now engaged in looking over their tackle, at the same time allowing free play to fancy. Their imagination entertains them with glowing pictures of what is before them on their anticipated spring outing in the wilderness, all of which are based upon, or to a considerable degree influenced by, the kinetoscopic views of past experience kindly furnished by memory.

What a tempting picture memory paints for us as our thoughts revert to bygone days spent on our favorite trout brooks! There is nothing wanting in foreground, background, perspective or tone to make a harmonious whole. No human artist could so truly depict on canvas the well-remembered scenes, or even approximately reproduce the beauty of those balmy spring hours. We see the distant Adirondack mountain summits enveloped in translucent blue haze, and intervening a vast, undulating expanse of gray tree tops. The nearer trees and shrubbery show the delicate green of the newly developing foliage, which in those more remote is lost in a preponderance of somber perennial tints. Above all is a cerulean sky, and the whole landscape is bathed in a warm, mellow light. Naught remains to remind one of the long winter which so reluctantly departed, save occasionally an isolated little patch of snow in some sheltered nook in the woods. The robins are singing among the maples while prospecting for a satisfactory building site for their summer home, the voices of bluebirds, thrushes and song sparrows are heard in chorus. The rattling notes of the kingfisher perched on the dead limb of a tree near by, the nervous cry of the bluejays among the balsams, and the chatter of the red squirrels in an adjacent thicket reach the ear.

The open bark camp, with the fire in front eating its way through the big pile of birchen logs; the blue smoke ascending in graceful curls; the steaming coffee-pot, suspended from a pole, where the blaze will just reach the bottom; and the frying-pan, in which the trout are nicely browned—all have the old familiar look.

We see the sparkling stream as it winds through the recesses of the forest, babbling and laughing over rocks, and dashing and splashing into dark pools. And again we behold it as it emerges from the woods and flows peacefully and indolently for a time, as if desirous in the broad stillwater of obtaining a little rest after its lively chase through the woodland. Then, as it at length becomes more energetic, we see it, with volume augmented by that of other streams which have joined it, rushing swiftly through narrow channels, carved by the constant wear of ages in a bed of granite, and anon leaping boldly from a ledge and tumbling in boisterous tumult in the foaming basin below. Thence we follow it through the gorge as it races over submerged boulders or plashes against and over protruding ones, its swirling current eventually calming down as it enters into and passes through verdant meadows and pasture lands.

We catch a glimpse of the dancing waters as they glisten in the sunlight on the rifts, where many a well-filled creel has followed the temptation of the speckled beauties. Once more we gaze on the placid surface of the alder-fringed stillwater, which is disturbed only by the upward leap and downward plunge of its carmine-spotted denizens, or we recognize the deeply shadowed pool 'neath the overhanging spruces, where more than one 2-pounder has succumbed after a bravely fought battle.

But there are some points in these pictures of memory, not manifest at first, which closer scrutiny will bring out, though by no means as strongly as the ones previously alluded to. Those things which we enjoy learning are apt to be longest remembered; and this is fortunate, for thus the general aspect of memory's paintings is rendered pleasing, and the involuntary impressions we receive from them are vastly more agreeable than they would be if all the unpleasant minutæ which analysis reveals were at once apparent. It is only by adjusting a mental opera glass that we bring to view the less agreeable features.

Very likely, if we take the trouble and linger long enough over the pictures of our trouting outings, we may discover that there were troublesome mosquitoes or black flies around at those times; that the water in which we were compelled to wade while angling was uncomfortably cold; that there were slippery rocks in the creek which were the cause of enforced, unexpected and unwelcome baths; that our artificial flies had a provoking tendency to alight on the limb of a tree and far out of reach, and that the big trout, the monarch of the stream, took the proffered lure at sight, but with equal promptness parted the line or leader and disappeared.

But what does it matter? The pictures are pleasing to look upon just the same, and perhaps after all what we enjoy is made more enjoyable by contrast with these less desirable features. A child once defined memory as "the thing I forget with;" but luckily this is not the case with everyone. Memory is a faithful artist, if provided with the proper materials to work with and agreeable subjects to paint from, and is a friend deserving of careful cultivation. Let us strive, then, as we go along, to make the most and best of life, laying by a store of intellectual treasures and pleasant thoughts suggested by manly and kindly deeds, from which memory can draw in times when their cheering and wholesome influence will be helpful.

While looking over my fly-book to-day and "reading between the lines," or, perhaps more properly, reading among the snells, hooks and feathers, as my lines are kept elsewhere, my eyes rested upon a 6ft. leader with three flies attached—a coachman, a red hackle and a Proctor. The flies gave evidence of having seen active service and the coachman looked as if he were deserving of a pension. The engagement in which they received their injuries occured on a little lake in the Adirondacks one day last summer, and the speckled beauties against whom they were pitted fought gamely. As a result of the encounter my creel was so well filled after a few hours' fishing that, having taken all our party of four could utilize, I abruptly terminated the contest while the trout were still fierce for the attack. It does not often happen in these days that the angler for brook trout ceases fishing simply for the reason that he has captured all he wants, but such was my experience on this lake on two occasions last June. But memories suggested by tattered flies form almost too fruitful a topic to open up at this time. The days are coming, however, and they are not far distant, when anglers will be busying themselves trying to hit upon a combination of flies that will prove taking to the trout. If any one who reads this article chances to be puzzled to know what kind to use while fishing on any of the smaller Adirondack lakes in early summer, my advice is to give the trio mentioned a fair trial. Possibly the fly known as the Reuben Wood might serve the same purpose as the Proctor, which is very similar in its make-up, but not quite as well known as the former. The chief point of difference in the two is that, while the body of the Reuben Wood fly is made of white chenille, that of the Proctor is of pale pink tipped with three turns of olive-brown chenille, a change suggested by T. R. Proctor, of Utica, the well-known hotel proprietor, who has had a good deal of experience with the trout in the Bisby Lake region.

Some of the veteran fishermen in Utica and vicinity have an old saying upon which they place much dependence, and this is that the time to go after brook trout is when the leaves on the alder bushes are as large as a mouse's ear. Others look to the butternut trees for a signal, as it is believed that the trout bite the best just after their leaves begin to show the green. One expert angler, who when he goes after speckled trout almost invariably meets with excellent success, says that for stream fishing there is no time like that when the lilacs are in bloom. The trout will usually be found on the rifts at this time. He claims the rule will hold good nine years out of ten. There is, however, once in a while a season when the streams become very low immediately after the spring freshets, and remain so for weeks at a time, there being no heavy rains to raise them. Under such conditions, or when there is a prolonged hot spell in May and early June, the trout spend but little if any time on the rifts, preferring to resort at once to the cold beds or spring holes, where they remain all summer. These of course are exceptional seasons, and at such times the stream fishing is very poor, even when the lilacs are in blossom.

The brook trout occasionally acts in a manner which is extremely tantalizing to the angler, and doubtless every lover of the rod and reel could relate some experience in which he has been mystified by their peculiar behavior. I well remember a June afternoon spent on the rifts on the West Canada Creek, below Wilkinson's Hotel, in the town of Wilmurt, Herkimer county. It was a warm day, and the sun shone so brightly that objects in the bed of the stream where the water was not too deep were plainly discernable quite a long distance ahead. After 3 P. M. the stream seemed literally alive with trout ranging from ¼ to ½lb. in weight; but although they were jumping on all sides of me, oftentimes in very close proximity, and frequently could be seen in the water apparently on the lookout for food, not one could be induced to rise to my flies. I fished with a long leader and three flies, changing the latter several times in hopes of finding one that would tempt the speckled beauties. I tried a long cast for a while and then used a short line. Finally I baited the hooks with angleworms; but all in vain, not a trout would deign to take the lure. I noticed that there was a small brownish-white fly on the water, and it was these insects which the trout were taking.

It was not far to Paull's boardinghouse, where our party was stopping, and about 5 o'clock I decided to go back there and try and rig up a fly which more resembled those on the water than any which could be found in my book. Accordingly I very reluctantly left the stream, and returning to the house spent half an hour in searching the premises for a suitable feather. I finally found in the barnyard a hen's feather which I thought might answer the purpose, and hastily attaching this to a hook I hurried back to the creek. Wading into the water again, I once more began casting about, this time with the new fly on the lead. I succeeded in getting a rise now and then, and caught perhaps half a dozen small trout; but the speckled beauties, although still jumping freely, seemed reluctant to strike the fly which I had taken so much trouble to fit up for them. At length I tried the experiment casting up stream, and this plan proved successful; for whenever and wherever the flies struck the water and temporarily sank beneath the surface they were seized by a trout, and I speedily had my creel filled. It was not an uncommon thing to take two or three fish at a cast, for as soon as one took the new fly, which was always preferred, the others were in demand. On one or two other occasions I have had a like experience, and always obtained good results by the use of a browish-white fly cast up stream.

An expert angler, who for many years has frequented G Lake in the Adirondacks, recently told me of an incident in one of his trips which is quite in this line. There were four in his party and all went out on the lake fishing one afternoon, occupying two boats. It was early in the season and quite cold. The gentleman who told me the story said that he and his guide fished unsuccessfully for awhile and the other boat went to the further end of the lake. "Finally," said the narrator, "I saw a small black object on the water close by, and on closer inspection decided it was the back fin of a big trout. I cast my flies toward the fish, but he ignored them. Very soon after this the surface of the lake in that direction seemed fairly to teem with trout and all were headed in the same direction. For some time we tried to get them to take our flies, but without avail. Then the boat drifted over where the trout were and they disappeared. In course of a few minutes, however, we pulled back toward where we had seen the fish and found they were up again. After repeated experiments I at length discovered that by using a very light-colored fly, casting as far as possible from the boat and allowing the flies to sink just below the surface before drawing them toward me, I could tempt the trout to seize them. This method we worked successfully for quite a time, and my friends in the other boat, who had returned and joined us, followed my suggestions and we speedily had all the speckled beauties we could dispose of. The fish ranged in weight from a ½lb. to 2lbs."

W. E. WOLCOTT.

UTICA, N. Y., March.

In the Blue Ridge.

HIGHLANDS, N. C., March 19.—Looking northward from the cotton fields of South Carolina one fine morning about two weeks ago, I saw for the first time the sky line of the Blue Ridge cutting the clear air some forty miles away. The sight of those peaks was exhilarating. I had read of them and of their history—their Indians and antiquities—their settlement by the whites, the battles which ensued; of their deer, bears, quail, turkeys and trout; their minerals and flora, and I desired a nearer view. I came, but I have not seen—that is, not much. This is because of the rain and mist which this season seems to have a special spite against the sightseer, and which is so thick that I can cut it with my hunting-axe.

This reminds me that in Mr. Hough's entertaining account of his winter expedition through the deserts between Chicago and Michigan City the comfort and well-being of the outfit was seriously endangered because of the short handle of their axe.

For many years it has been my practice to carry in the forest an axe weighing, with the handle, about 2½lbs., and measuring over all 28½in.

I inclose an outline sketch of this implement, which, though sometimes a little more in the way than a "pocket-axe," is easily carried in a suitable loop, and in my experience has paid for the little additional trouble it may have occasioned. There is no extra flummery about this axe—it is straight business, and anybody can get one if he chooses.

I observe that the tracing makes the handle appear somewhat wider than the original—perhaps ⅜in.

On Walden's Ridge, in Tennessee, where I passed the winter, there was no shooting or fishing worth the mention. Some gray squirrels and rabbits, a very few turkeys, and scarcely any quail or grouse, are what one may look for if he cares to shoot. Perhaps before I leave these mountains I may find something to write about.

I inclose a few leaves of the galax, which is said to be found nowhere but on the Blue Ridge and on the mountains of Japan.

KELPIE.

Trout Streams in Central New York.

ITHACA, N. Y., April 1.—The trout streams in this part of the State are practically free from snow water, and all the conditions point to a successful opening day a couple of weeks and as many days hence.

The irrepressible brook trout angler, in joyful anticipation of the event, has unlimbered his tackle and daily does a two-step with becoming agility.

M. CHILL.

ANGLING NOTES.

At the Sportsman's Exposition.

IN one of the fly-casting contests Mr. C. H. Mowry, of Syracuse, was on the platform and casting as perfectly as possible in everything but distance, and it was for distance that he was casting. His fly would come straight as a die out over the tank from 6 to 10 or 15ft. above the water at the end of the cast, and then die away or curl back on the leader or line. In no contest in which I served as one of the judges was the fly at the end of the cast so far above the water as when Mr. Mowry was casting. The judges commented upon the fact that the fly did not do what it should in the way of dis'ance for such admirable casting so far above the water when the limit of the cast was reached, but it was not within their province to tell the caster, and so a friend in the audience back of the judges informed him that there was something wrong with his shooting of the line. When he stepped down with a mark of 72ft. I told him that if his fly had had any push behind it he would have made a better record, and he said he knew it, but he could not understand why his fly died away so, nor why his line would not shoot when his rod and line were straight and going level. After the contest Mr. T. B Mills took up the same rod for practice, and after casting for a few minutes remarked that something was wrong, and reeled in to examine his tackle. He found that in about the middle of the tip the line passed through a rod ring and then around the tip before it passed through the next ring, making what might be called a cinch against record-breaking Later I met Mr. Mowry on the floor and told him how he had been hoodooed, and he made some remarks which I will draw a curtain over.

The Egyptian Goose.

The exhibit of domesticated wild game birds was particularly interesting, and no single part of it was of so much interest to me as the Egyptian goose. This is how the geese appeared to a writer on one of the daily newspapers:

"There are several specimens and they all seem unhappy. They look more like aquatic buzzards than they do like anything domestic. Of elongated legs and attenuated figures, their markings are palpably cuneiform and their expressions sphinx-like. The slate-gray of their backs shades into the rich seal brown of their wings, and in their mottled bosoms is a dark-brown patch bearing a notable resemblance to a map of Abyssinia."

I watched these birds for some time one day and I did not see them at all as the writer did whom I have quoted, and to-day I could not recall anything about the color of their backs or wings if I had not noted what he said. In fact, about the only peculiarity I noted was that each bird was bearing on its breast and sides enough feathers to make many dozens of perfect imitations of the wings of the green-drake or May fly. Collectively those birds had feathers enough to make a thousand gross of the very best trout fly wings. A friend, a physician, who was with me went into raptures over the various birds in the different boxes, looking at them entirely from the point of a gunner, while I saw only the feathers for artificial flies going to waste. He wished to shoot the birds flying, while I wished to pluck the feathers. A good imitation of a May fly, or rather of the green-drake, is difficult to obtain, and the Egyptian goose and the wood or summer duck furnish the best, because they furnish a perfect feather that is undyed. I have been looking over the price lists of several European dealers who furnish feathers and skins for fly dressing, and not one quotes the feathers or skins of the Egyptian goose. The summer duck's feathers are quoted at 50 cents per dozen; but this duck furnishes but a very few feathers of proper mottling and color, while the goose furnishes hundreds.

When Stanley returned from his last exploration of Africa he was to complete his book, "Darkest Africa," in Cairo, before he proceeded to England. Mr. Edward Marston, of his firm of publishers, went to Egypt to meet Stanley and remain until the MSS. were completed, and necessarily he remained some time. As he was about to leave London, his son, Mr. R. B. Marston, asked him to be sure and secure some Egyptian geese for the feathers to make May flies; but the elder Mr. Marston was obliged to return without a single feather, which shows that his son did not send to the right place, for there were plenty of the birds in Madison Square Garden.

For years I have searched far and wide for the feathers of the summer duck to obtain material for dressing flies, and while I have obtained a comparatively small number I have learned of far more that were wasted.

"Lady Fly-Casters."

It was with pleasure that I learned during the week of the show that there was to be a class for "lady fly-casters," and it is to be regretted that it did not fill, and the management of the Sportsmen's Exposition will be wise if next year they provide a class for women fly-casters and announce it at the outset, for there could be no more popular feature of the show.

One morning there were some ladies present, relatives of one of the men who was a prize winner, practicing on the water of the tank, and no more graceful casting was done during the show than by these ladies, confirming what I long have believed, and advocated in print, that fly-casting was particularly a sport for women. I learned of one woman in New York who is very fond of fishing, and who can cast between 80 and 90ft. of line, and do it easily, for she has never cast for distance or in a tournament, as all her practice has come from fishing for fish and not for medals.

Trout and Camera.

During the show this thought came to me: Is the photographic camera responsible for the decrease of trout or other fish, and if so in what degree? Will it be necessary in order to preserve our fish to insert in our game laws a section providing that no fish of any kind, except for scientific purposes, shall be photographed; or, not more than four trout, salmon, lake trout or black bass belonging to one man shall be killed and photographed in one day; or, any man who has his photograph taken with more fish than he can eat in fresh condition, or send to his friends, shall be sent to jail for six months?

The desire to have one's picture taken with a lot of fish, more apparently than can be used as food, seems to be a disease that is spreading, and it is a disease that should be dreaded as much as yellow fever. The camera fish hog is probably an own brother of the trout hog that Nessmuk used to write about.

It is rather funny that in these photographs or reproductions of photographs of people with a lot of fish that look as though they had just been taken from a net or a fishing smack, in spite of the rods, reels, bait, buckets and fly books that are put into the picture as properties, the people are never beardless boys, but men grown—men with gray hair and beards, men who look like intelligent men, and yet they will pose before a camera with a wagon load of fish like the hero of a great battle fought and won.

How it may strike other fishermen I cannot say, but when I see a picture with a man or a lot of men photographed with more dead fish in their possession than the law of decency should permit, and read that the fish were caught in Trier Pond, near John Smith's Hotel, Trier Pond is the very last place that I would visit for the purpose of fishing; for if John Smith encourages the camera fish hog to advertise his hotel I should feel that all the fish from Trier Pond had been used for photographic purposes, and it would not be a good place to visit for simple angling after the camera had done its deadly work. We talk and scold about the poacher and net fisherman, and the spearer and set line fisher, but I sometimes think the camera fish hog should go in the list and be given a front seat.

I have referred to a man's having his photograph taken with more fish than he can eat or send to his friends, but I never yet could see where I paid any one a compliment by sending him trout that had been railroaded and packed from the wilderness to civilization; so I never try to pay such a compliment, and never in my heart can thank any one to send me fish that are not fresh.

Trout to be in their best condition must be eaten where they are caught, and you cannot bring trout from Canada or the Adirondacks and have them as fresh as when first taken. If a man wished to send me a fish I would thank him most heartily for a fine salt mackerel, but no trout that have been toured. Last year a friend came from the Adirondacks and brought me three fine trout, that is, they had been fine trout in their youth, but age had stolen over them in consequence of being taken from the water; and even while he talked and told me of the sport he had in catching them, I knew the fish were going into the ash barrel as soon as he was gone. He meant well, but I fear he had lost his sense of smell. The camera and a desire to pay a worthless compliment to friends are together responsible for the slaughter of many fish that must be wasted. Look at the Maine Central publication distributed at the Sportsmen's Show. Six men and sixty big trout and salmon are displayed in a reproduction of a photograph, saying that the catch was made in one afternoon. I presume all the fish may have served some good purpose, anyway I will assume that they did; but which is the better picture, and which will more quickly arouse the angler's enthusiasm: the sixty trout and six men, or the picture in the same publication of five trout weighing from 1½ to 3½lbs.? One is a genteel sufficiency, and the other is not.

Last year I saw in a camp in Canada a lot of trout hung in festoons like sausages in a market. They had been hung for photographic purposes evidently, but the occupants had left the camp and did not return till next day, when they packed and departed for good. I do not know anything about it for a certainty, but I presume all those trout were spoiled and wasted. If they were taken from the camp they could not have been good to eat, for the camp was a long way from a railroad or other transportation line, and doubtless the trout served only to make a picture.

A. N. CHENEY.

New Jersey Fishing.

ASBURY PARK, N. J., April 2.—The trout season opened in this State yesterday, and the day was favorable for such as could improve the opportunity. Dr. Kinmouth, the most enthusiastic trout fisherman in this section, was on his favorite grounds early in the day. He fished Pine Brook, the best stream in this county, and took seventeen fish. He reports the fish abundant, but running very small; he took a great many under the legal size and returned them to the water. This last can be depended on, for so enthusiastic is he that he would fight at the drop of the hat with any man who would kill an undersized trout. He says the good work of planting by our State Commission last year is in evidence, as it was not unusual to have a half dozen fingerlings at a time dash at his cast.

White perch are now biting in the lakes and estuaries, and are welcome indeed after our long winter's wait. The fish is in no manner to be despised when taken on a fly rod. As is well known, he is a congener of the striped bass, and in consequence activity prevails among the bass fishermen; rods and reels are being put in order and tackle is being laid in for immediate use. I saw three beautiful specimens of bass which were taken at Salem on Tuesday night of the present week, in shad nets, the heaviest of which weighed 47lbs.

Owing to the disasters of the past season, fewer pound nets will be in use along the coast the coming summer. This should add to the angler's pleasure and secure additional guests to the hotels. The same old fight has been carried on during the past few months in the Legislature against the pound nets, and the bill was lost by only one vote, which shows the trend of public opinion in relation to the indiscriminate destruction of food fish. The passing of the pound net in its present form is an assured fact in the not distant future. LEONARD HULIT.

Charlotte Harbor Tarpon.

IT may be of interest to your readers who are tarpon fishermen to know that tarpon fishing has been very good in most of the waters of Charlotte Harbor during all of March. At Captive Pass, Matlacha Pass, Marco and all below Myers, and about St. James and Blind Pass, a number have caught two in a day, and one or two three in one day. Quite a number of fishermen have caught ten tarpon in the month.

There is an abundance of fish of all kinds, and this season shows that there will be good fishing some time to come. The weather has been very warm, with plenty of wind.

C. A. D.

American Fisheries Society.

GLENS FALLS, N. Y., March 27.—The twenty sixth annual meeting of the American Fisheries Society will be held in Detroit, Mich., June 17, 18 and 19. Members are requested to prepare papers to be read before the meeting, and send titles to the recording secretary as early as possible, so that a notice of articles may be sent out with a later announcement, giving place of meeting and headquarters of the Society in Detroit. A. N. CHENEY, Recording Sec'y.

Attean Lakes.

IN a note on the Attean Lakes, Maine, last week, the station Jackman was incorrectly printed Jackson.

Wisconsin Lakes.

THREE LAKES, Wis, April 3.—The lakes will be open in ten days or sooner; and I think the fishing will be good.

F. R. FRENCH.

Mr. Mansfield's Record Cast.

LAST Sunday was a great day for the San Francisco Fly-Casting Club. It was a day of rejoicing; for it was the second time that a member of the club had broken the world's long-distance record. Last October Mr. H. C. Golcher raised the figures to 103ft., and set the angling world to thinking. But last Sunday Mr. W. D. Mansfield fairly electrified the whole assemblage by smashing all previous records with the most apparent ease, and giving the whole world a new mark and a new champion.

Following are the scores of the contests held on last Saturday and Sunday in the long-distance cast, the longest cast of each competitor being given:

SAN FRANCISCO FLY-CASTING CLUB—CONTEST NO. 3.

Medal contests, series 1897, held at Stow Lake, Golden Gate Park:

Saturday Contest—Judges: Col. G. C. Edwards and E. A. Mocker; Referee, A. E. Lovett; Clerk, A. R. Crowell.

Sunday Contest—Judges: J. S. Turner and F. H. Reed; Referee, A. E. Lovett; Clerk, A. R. Crowell.

Saturday, March 13.	Feet.
W. E. Batcheller	88½
Horace Smyth	72
A. R. Crowell	67
H. Battu	65½
A. E Lovett	84½
C. G. Young	69
E A Mocker	74
Col. G. C Edwards	77

A. B. Finch	68
R. Isenbruck	50
Charles Klein	65
J. P. Babcock	70

* Handicap, 5½ft.

In this issue we publish a half-tone of Mr. Walter Damon Mansfield, the champion long-distance fly-caster of the world. Mr. Mansfield is an attorney by occupation, and an expert angler by natural selection. In statue he stands but 5½ft., and weighs 170lbs., and is thirty-six years of age. It cannot, therefore, be said that he is of athletic build; but there is a muscular force of great elasticity in his make-up, and this, from his very toes to his wrist, is utilized to a wonderful extent in making his marvelous casts, not only in distance, but in accuracy and delicacy also.

His method of casting is what might be termed a free-arm movement, aided by the muscular spring of body, legs and feet; throwing the body well back and the arm at an angle of not more than 40° from the horizontal in the back cast, he brings the arm and body well forward until the arm is nearly horizontal and the upper part of the body almost so in his forward cast; the line gradually unfolding until at last the fly slowly flutters down at the end of a straight line like a falling snowflake, just in time to recover before much more than the leader touches the water.

The tackle used in his wonderful performance of last Sunday was originally an 11ft., 9¼oz. Leonard rod. Recently this rod had been broken just below the ferrule of the second joint, and in repairing it it was shortened to 10ft. 8in. A repair also made at the handle increased its weight to 10oz. The line used was a double-taper "D" line, with a 9ft. taper leader and a No. 10 fly. The weather conditions could not have added to the chances of making great casts. The day was cloudy and somewhat hazy, with a moderate wind veering with uncertain gusts.

Nor was the cast by any means a chance one. Of the casts after time was called more than a dozen were over 100ft. After making the record of 108½, four more were made as follows: 102, 104, 105 and 108½.

Last October, when Mr. Golcher with his cast of 103ft. broke the world's record of 102½ft., then held by Mr. R. C. Leonard since 1888, we predicted that before a year from that time, with the rapid improvement being made and the skill shown, that 110ft. would be reached. But half of the allotted time has elapsed, and the record is but 1½ft. short of our prediction, and a new champion modestly wearing the honors. Either of these gentlemen is more than liable to reach our mark before the expiration of the allotted time.

Mr. Mansfield has been a fly-caster all his life, never using under any circumstances either bait or spoon; but at the inauguration of fly-casting tournaments on the coast he was but little, if any, better in a long-distance contest than any other members of the club, his longest casts only reaching from 70 to 77ft. He at once became much interested in the sport, and has studied the art from all its bearings; listening to the advice of others and trying all methods until from them all he has evolved a method of his own, which, whether the best or not, has enabled him to place in the most delicate manner possible the frail little fly at distances never before reached by any other—a mark for many to reach for, and but few, if any, ever to surpass.—*Field Sports, March 20.*

Salmon Fishing for Sale.

FREEHOLD, on the best fishing waters of the southwest Miramichi River (Burnt Hill). For terms and particulars apply to Thomas J. Conroy, 28 John street, New York city.—*Adv.*

THE FORESTRY RESERVES.

CHEYENNE, Wyo., March 25.—*Editor Forest and Stream:* I have read with much interest your editorial on the forest reserves, appearing in your issue of March 20. Upon matters of interest to the West you have heretofore been so uniformly fair that I feel confident you desire to be so in discussing this question. A correct understanding of the facts and existing conditions is a condition precedent to a candid discussion of this forest reserve proposition. Instead of having this knowledge, it appears that each side in this controversy is charging the other side with the grossest ignorance. An intimate acquaintance with the people living west of the Mississippi River, extending over a period of twenty-eight years, constrains me to believe that they are not given to "doing or saying wild things," or to "going off at half-cock" upon propositions where their own interests are nearly concerned. The Forestry Commission was compelled to make some sort of a defense to the severe criticism which their action called forth, but it is not satisfactory to us to have them attempt to quiet our apprehensions with promises of what they propose to do, while at the same time our alarm is attributed to ignorance of their plans, no intimation of which was given until after the storm had broken upon their devoted heads. The Commission had been warned of the danger of hasty and inconsiderate action, and its statements now appear to people familiar with the rules governing forest reserves not as reasons, but as excuses

As a friend of forest preservation, as the Governor of a State where, prior to the recent action of the President, nine-tenths of the people were active advocates of an adequate

forest preserve law, and where our newspapers and political parties without exception were united in advocating such legislation, I believe that the Forestry Commission has, by its methods, needlessly antagonized the influences on which success most depends; has made its recommendations without sufficient knowledge of the facts; has disregarded the opinions and advice of those best qualified to determine the proper course to be pursued, and has, by these blunders, discredited and seriously imperiled a worthy cause. I do not believe I am talking about something of which I know nothing, and shall endeavor to be fair and dispassionate, stating nothing but known facts, trusting in this way to escape the admonitions of your editorial.

Our first objection to these reserves is that until the law is changed they will accomplish no useful purpose. It is the experience of the people of this State, and the admission of the Commission which recommended these reserves, that the present law does nothing to preserve timber from fire, the chief agent of its destruction. Withdrawing these areas from all beneficial uses is of itself of no service unless some provision is made for their management and for police supervision. The present law makes no such provision. It withdraws from these reserves the protection of local interests and leaves them exposed to the camp-fire of the hunter, tourist and sheep herder, the irresponsible sources of the destruction of more timber in this State than all the causes you have enumerated.

Your assurance that "no one is injured," and that all our objections have been "shots fired at a phantom," would be exceedingly comforting if true; but when we reflect that if a settler's home is included within the boundaries of a reserve, there is no way for him to get title thereto; that if untimbered agricultural land is included within such boundaries, there is no provision in our present laws for having this mistake corrected and the lands opened up to settlement and development; when we remember that there is no provision for the miner to continue his search for undiscovered mineral wealth or to operate mines already known; that there is no legislation under which we can use the splendid irrigation reservoirs which exist in these mountains, or by which rights of way can be had for ditches, roads or other needed local improvements, we are warranted in believing that the advantages of these reservations are in no wise commensurate to their abuses, but, on the contrary, no more serious blow can be struck at the growth or prosperity of any section than through the segregation of land under this law.

You say that the Commission is going to recommend that all these abuses in the present law be remedied, and seem to consider that this recommendation is equivalent to the enactment of a law on that subject. For the good of Wyoming I wish I could believe this, but the unhappy experience of our people during the past six years makes me believe that there is a wide difference between this Commission's recommendations and the passage of a law by Congress. In 1891 President Harrison, by proclamation, set aside as a timber reserve a large area south and east of Yellowstone Park. It includes the upper portion of the valley of the Stinking Water River, which contains no timber, but which, at the time this reservation was made, was partly settled by people who had constructed irrigation works, built houses and created homes. Including this land is an admitted blunder. There has never been any controversy over the facts, but repeated petitions of settlers and the persistent efforts of our delegation in Congress have been insufficient to secure either a modification of the boundaries of this reserve or the enactment of legislation which would give these people the right to own and enjoy their homes.

On the head of Sunlight Creek, in the same reservation, is a mineral belt where prospecting had been going on for three years prior to the creation of this reserve. Discoveries of known value had been made, money had been raised and arrangements perfected for the development and operation of these mines. The creation of this reserve put an end to all this. Here at least is one district where tunnels have not been run nor shafts dug, but, on the contrary, I am informed that the holders of these claims were notified that they had no right to continue their work within the boundaries of this reservation.

These two illustrations were duplicated in other portions of this same reserve. Hence the solicitude manifested about the results of this extension, and which will continue until we learn whether or not the Forestry Commission is able to control legislation and secure results not possible to our Congressional delegation.

But if there was no objection to the law governing these reservations, there can be no two opinions as to the methods pursued by the Forestry Commission in fixing the boundaries of some of those recently made. It is no sufficient answer to the criticisms which have been made on this score to say that its members are of high rank and distinguished attainments. In my judgment this fact only renders the criticism to which they have been subjected the more deserving. The reservation made on the summit of the Big Horn Mountains was one of the most important with which this Commission had to deal. It affects the most important agricultural district in Wyoming. It deals with an area in which there are important mining camps and a large number of valuable reservoir sites, some of which have been improved. It withdraws from the settlers occupying this region every opportunity of making a legitimate or harmless use of the timber, and in one way and another vitally affects fully one-fourth of the people of this State.

I cannot understand how a commission could expect to deal intelligently or adequately with so important a measure as this without informing themselves fully, from personal observation or otherwise, as to the actual situation and the consequences of their action if taken.

The Commission made no examination whatever. They passed through Wyoming on the fast train of the Burlington Railroad, which at no place is within fifteen miles of these mountains. When this train stopped at Sheridan the people of that town, having become accidentally advised of the presence of the Commissioners, solicited them to stop at least for a day and make an examination of the reservoirs and irrigation works already built within the limits of the forest areas on these mountains. Provision for their transportation, all the expenses of their maintenance were to be provided, not by interested parties, but by a member of the State Board of Water Control of the State and one of the officials of the State most interested in forest preservation. Instead of doing this, they preferred to pass on without stopping and to consider these matters in the attractive and salubrious surroundings of Yellowstone Park, a hundred miles from the area with which they were dealing.

Later on a member of this Commission wrote to the State Engineer of Wyoming, requesting him to mark the boundaries of the forest areas on the Big Horn Mountains on a Land Office map. In reply thereto the engineer explained that it was impossible for him to fix accurately these boundaries, and that the map which he sent them was only an approximate outline. After expressing his interest in forest preservation in Wyoming, he made the following suggestion, which is worthy of consideration, in view of the complete change of public sentiment on this subject which has followed the Commission's action:

"I trust, therefore, you will not think I am lukewarm in the cause if I suggest that I believe it would be much better policy to withhold making these segregations until provision can be made for a survey which will accurately define the boundaries of the timbered areas and only include these, thus avoiding the withdrawal of agricultural land. The segregation of any considerable areas not timbered furnishes a basis for criticism and for bringing into local disrepute the whole policy of forest preservation.

"I am also convinced that there ought to be immediate provision made for policing these reservations and for the proper disposition of timber to settlers. The simple segregation without some measure of police supervision does little good in either preventing fires or in restricting the depredations of sheep, while on the other hand it is very irritating to the settlers on contiguous areas if such segregation happens to include a little land not timbered on which they wish to file, or think they do.

"I offer these suggestions because I want your recommendations in regard to comprehensive laws to receive the sanction of Congress, and I believe this is of far more importance than a little delay in securing additional segregations, and I am fearful that some of these will arouse antagonisms in the arid States which might defeat for the present the whole proposed reform."

The reservation as made on the Big Horn Mountains includes a number of irrigated farms which have been occupied and improved, but not filed on because of the absence of accepted public land surveys. It includes extensive areas of land on which there is no timber. It includes the region around several improved reservoir sites and through which ditches have been built. It includes mining camps and districts believed to be rich in mineral wealth, while it excludes the most densely timbered portion of the Big Horn Mountains, in which the camps of a railroad tie contractor are located.

It is the belief in this State of those best informed on this subject that to extend reservations under the present law is to multiply abuses instead of benefits; that the first thing to do is to enact an adequate law governing these forest areas; that if these reservations are of sufficient importance to be made at all, they are of sufficient value to justify the making of a preliminary survey to determine what lands are timbered and what lands are agricultural, and that no such important action should be taken until there has been at least a personal examination. It is the general belief that every reservation which has thus far been made in this State has been improperly made; that they embrace large areas which have no timber, and that they exclude equally large areas densely timbered, and which should have been included if the law itself was of any value. No one in Wyoming has ever been able to furnish a rational explanation for the boundaries of the timber reserve south and east of Yellowstone Park It includes large areas of untimbered lands south of the Park and east of the Park. By not being extended along the entire east side of the Park, it excludes one of the most densely timbered sections of the State. It is suggested that this exclusion was made through the influence of Montana parties, whose interests would thereby be affected. It was not left out through any consideration for either the irrigation, forest or any other material interests of the State of Wyoming.

The opposition to the recent reservation is not opposition to forest preservation. It is a protest against the abuses and inadequacies of the forest reserve law, and the arbitrary and incompetent methods pursued in its enforcement. It is neither captious nor ignorant, but is based upon an unhappy experience in its previous operation, and grave solicitude as to the character and success of the promised measures for its betterment

Wm A. Richards, Governor of Wyomin g.

Everett, Wash., March 20.—*Editor Forest and Stream:* In my letter appearing in your issue of March 20, protesting against the forest reserve and asking you to point out in what manner the segregation of millions of acres in Washington will redound to the benefit of the Western country, you reply by characterizing the alarm manifested as groundless because based on an entire misapprehension of facts. Permit me to say that the people of this State most earnestly desire those facts, as the conclusions arrived at by the Forest Commission are not warranted by the condition of affairs as viewed by the residents of the territory involved. It may be that the Forest Commission has divining powers superior to any possessed by the people of this State in looking to our future welfare, but it is logically certain that the people of this coast claim to be more competent to judge of the effect of the reserve order on the present condition of business interests here than the non-resident gentlemen who, in making up their reports, segregated the lands without consulting the persons first interested. It seems to me that the protests of the people directly concerned should be accorded a fair hearing, not thrust aside as the hasty talk of persons who "go off at half-cock," ignorant of what they are talking about. Nor does your suggestion to wait until further information will enable them to form an intelligible opinion on the subject seem pertinent when it is asserted that injury has already been sustained.

When persons see their homes and business invaded it is natural to express some apprehension of the results that may follow, and enter their protest; hence it is logical, when this interference intrudes under the guise of benevolence, to hold the alleged benefactor at arm's length until he can give an account of his proceedings.

The proposition to set aside the lands in Washington did not emanate from residents of this State, but from people on the Atlantic coast. The Eastern press is loudly in favor of the reservation, while the Western press opposes it, and in the face of statistics it would appear that some of the Eastern papers are as densely ignorant of things concerning our country as are some of the foreign writers on American institutions.

The New York *Tribune*, commenting on the reserves, says: "It has insured so far as its operation extends a lasting timber supply, protected the headwaters of streams, and incidentally preserved scenery and game in regions where both were exposed to unprofitable ravage." "If the opposition proceeds from persons claiming that their privileges are attacked, it is true and pertinent to reply that they are them elves trespassers."

The Springfield (Mass.) *Republican* says: "Who then are the people of Washington and the other States about those reservations who are making their clamor roar against the act of the President? They belong no doubt to that class of timber thieves and prospectors and ranchmen who make a business of appropriating public land to their own uses without authority or expense."

The Boston (Mass.) *Journal* says concerning the opposition: "It is doubtless inspired primarily by the individuals and corporations concerned in the promiscuous cutting of timber on the public lands. There is no reason why consideration should be shown to these timber thieves." "By a dispatch it is estimated that 900,000 homes would be wiped out by this order. This is nonsense. Doubtless there are some settlers who would be incommoded." "But these lands * * * are all public lands" "How happened these settlers to be on lands which do not belong to them?" "No one who has given intelligent and disinterested consideration to the subject doubts for a moment that the proposed reservations are in the public interest and are practically indispensable if anything is to be done to prevent the drying up of water courses and the sterilizing of soil through the destruction of forests. It is monstrous that this reform should be thwarted by the clamorous greed of the very men who have been foremost in producing the evil whose consequences it is attempted to relieve"

The Louisville (Ky.) *Courier-Journal* says: "Mr. Clark, of Wyoming, in discussing (in the U. S. Senate) the setting apart of forest reservations, complains that the fourteen Senators of the States affected by it had not been consulted. Mr. Clark appears to think that the public lands of the United States belong to the mining camps On the contrary, they belong to the whole people of the United States, and the fourteen imitation Senators have no more to do with it than Senators from real States."

The above are samples of the arrogance and ignorance as well as falsehood displayed by prominent Eastern papers that seek to pose as public educators. Their false and presumptuous statements may be disposed of in short order. Anyone at all conversant with the homestead laws of the United States knows that the people who have settled on the public lands are not trespassers, because they were invited to go on those lands for settlement or location by the terms and provisions of those laws wherein they were assured that they would be accorded a preference right to entry as soon as the lands become surveyed. Millions of dollars have been paid to the Government by settlers, and if the United States had used the money in surveying out the remaining lands these people would be the owners.

Furthermore, it will be news to individuals and corporations in Washington that they make a business of appropriating public land to their own use without authority or expense, as the *effete* Massachusetts press puts it. We have heretofore, and are still deeply impressed with the fact that public lands here cannot, under the existing laws, be appropriated in the manner stated any more than private lands. If the editors of the Massachusetts and Kentucky press will inquire at any of the United States Land offices located in this State they will be able to obtain some valuable information concerning subjects pertaining to the public domain, of which they are now densely ignorant. In fact, an Everett schoolboy can give them some valuable points on the land practice. But why should the people of Massachusetts and Kentucky show such an interest in the welfare of this State to the exclusion of our having a voice in a matter virtually concerning us? The public lands in Washington never cost those States nor the Federal Government $1 of the people's money; and when the people residing within the borders of this Territory and Oregon desired to come into the Union the Representatives of Massachusetts vigorously opposed recognition of these lands. Both Massachusetts and Kentucky, on their becoming parts of the Union, were, upon their imperious demands, left in possession of the public lands lying within their respective borders. Is not their assumed dictatorship over our people somewhat strained?

The three proposed reservations in Washington constitute nearly one-quarter of the entire State. They constitute an area almost twice the size of the State of Massachusetts, and nearly one-third as large as New York. The mineral land included in one single reservation in the Cascades will contribute more wealth to the world in the next twenty years than the whole State of Kentucky has contributed in the 100 and more years of its settlement; and to-day with only seven years of age as a member of the sisterhood of States, Washington has more white inhabitants than had Kentucky when she gave to the Whig party its national leader.

Let me next call your attention to a paragraph in the description of the Washington reservation covering the Cascades, contained in Section 8 of the order: "The region embraced extends over both sides of the Cascade Mountains, and is exceedingly broken and entirely clothed with forests. The reserve is one of the most rugged, difficult, least known and least settled parts of the United States." The italics are mine. Mr. Editor, you can, I am sure, verify my assertion that the description is false by referring back to various columns in your journal. Were I to state to you that the Cascades are clothed entirely with forests, as the Forestry Commission has asserted to millions, I should expect to be severely rebuked. From my office window is visible the Cascade range, from Mt. Baker to Mt. Rainier; and summer and winter the mountain tops present a snow line in distinct relief against the clear blue of the eastern sky.

From personal examination, and from reliable information derived from engineers, prospectors and miners, I believe fully three-fourths of the Cascade country embraced by the reserve always has been, and is destitute of timber worth marketing, while one-fourth of the area is devoid of trees, and is a vast tract of snow, glaciers and naked rocks, rich in mineral. The Cascade tract includes more than half of the counties of Whatcom and Skagit and one-third of Snohomish, while on the eastern slopes one-half of Okonogan county is included. In Snohomish county where I reside there are thirteen prosperous towns included in the reserve whose mining properties give employment to over 1,000 people and the means of support to 20,000 more. There are over 4,600 mining locations in this single county, and there has been expended in their development, and in the construction of concentrators, tramways, tunnels, smelter, railroads and fixtures, an aggregate of $6,500,000. Aside from these millions there have been expended enormous sums in purchasing and bonding mines in this county. In the other counties there have been expended large amounts, although not to the extent of the development done in Snohomish county. From this it certainly does not appear that our Monte Cristo district is the least known and least settled part of the United States.

Few have any conception of the difficulties to be overcome to carry out the work of exploration, location and development. With the opening of spring this work would have been renewed on a larger scale than ever.

New claims would have been located in the vicinity of others already made, and the people and transportation companies were ready for it. It was just in the preliminary stages that the executive order came which placed a check on development of further work, and caused capital, whose agents were on the ground, to suddenly seek other fields of investment. It is in view of this sudden check that has been put upon the mining interests pending further consideration of the matter at the National Capital that causes me to demur to the assertion that we are like children frightened at a stump bear. We have certainly found to our cost that your stump bear was real enough to make that capricious goddess of capital so suspicious as to put a stop to further work in our prospecting.

I regret to notice that your paper, along with other representatives of the Eastern press, acts upon the assumption that we of the Northwest are so ignorant as to be unable to minister to our own wants. But you seem to forget that the men in Washington who are developing the resources of the State are from among the educated and energetic classes of the East who have widened their intelligence by labor in this new field of operation. We have men who came here with theoretical ideas of the sciences of forestry, engineering, natural history and mining, learned at the universities of Cornell, Harvard, Princeton and Yale, who have by contact with and study of the peculiar conditions met on this coast, under all conditions, added to their knowledge. These men have personally explored the cañons and snow-capped summits of the Cascades, traversed the scrub-grown ridges and slopes, and penetrated the gigantic forests of the lowlands. They are also familiar with the local histories of the different sections of the State. They have also studied the homestead, timber and mining laws of the United States, and become familiar with the rulings of the Land Office. They are not timber thieves nor ignoramuses.

These men say that if the object in creating the Washingto reserve, as is asserted, is to preserve the forests of the State from depredations of corporations or individuals, and for the protection of the watersheds as a means of climatic equalization, that the objects will probably miscarry. For the purpose of preserving the forests that have commercial worth, the order comes forty years too late. All of the valuable timber west of the Cascades grew at near sea level and within twenty-five miles of Puget Sound. This area has all been surveyed, and nearly all of it patented, and the mill companies have been assiduously at work culling the choicest timber under their purchases from the Government. The western line of the Washington reserve barely touches timber of merchantable quality. As to protecting the headwaters of our rivers, the reserve or its object does not seem to cut an important figure. The two great rivers of the State—the Columbia and Skagit—rise in British Columbia, far from the boundary, while nearly all of the rivers and streams of prominence in the State have their sources in the everlasting glaciers.

In the Puget Sound district a diminution of the rainfall is rarely considered. Because when the timber on the lowlands is out a second growth springs up so suddenly that for one tree six will replace it in three years. As the new growth is more dense than the old it preserves moisture and shades the ground more completely than older trees. Even if denuding the lands of forest would diminish rainfall as understood in the East, there is no reason to believe it would do so here; for so long as the winds sweep landward from the Pacific, and the great mountain chain favors condensation as we now witness it, there should be rain. There should be no fear that denuding the land of trees would favor sudden freshets by the melting of snow in large bodies, since here where the forests exist there is practically no snow, while on the other hand snow exists in large quantities in the sections where there is little or no timber. As to protecting the scrub growth that exists on the mountain sides and in the reservation from any depredation, every one here realizes that the prospectors and miners are particular to preserve all the trees in the vicinity of the mines as very useful barriers to snowslides. Furthermore it is current rumor that some of the forest fires that have occurred in the mountains have been started by tenderfoot hunters from the Eastern States.

How well these conditions were considered by the committee of experts is not known, but the sweeping nature of the order would indicate that they had given the matters but superficial attention if any. Neither does the report show that the committee personally visited and inspected the lands reserved, nor sought information from competent persons. It is currently reported here and believed that the committee made no further examination than was available by a ride across the country in the cars.

Most of the coast residents are aware of an existing rule of the Interior Department predicated on the law of 1891 for creating reserves, which requires special agents who are requested to make recommendations for forest reserves, to acquire full knowledge of the proposed reserves and cooperate with the authorities and citizens of the States for whose benefit the reservations are to be made, and before recommending the reserves to publish in the newspapers in the county where the reserves lie full descriptions thereof and file the same in the Land office in the district. None of these requirements were obeyed, no distinctive tracts were reserved, but a blanket reservation was placed on the unsurveyed lands irrespective of towns, roads or mineral locations. The whole proceeding was so sinister in its appearance when first promulgated that many believed it a part of a scheme in the interests of the railroads whereby they would be enabled to select sections in more valuable localities in lieu of the ones apparently withdrawn by the order.

You state that the order was only an initial step to be followed by recommendations from the commission, permitting agricultural lands to be occupied and mining to be prosecuted, but the trouble is that the recommendations of such a plan was not concurrent with the order of reserve. People here who are familiar with dealing with the Government, recognize that an order from the executive of the Interior Department means what it says, and must be obeyed; and they do not propose to transgress its terms with the thought that there may follow some unmentioned modifying edict. In your effort to defend the laches of the Commisson in failing to have embraced in the order of reserve excepting clauses permitting settlement and mining, you say that in former reservations no settler or miner has been interfered with. I fail to reconcile the statement with the Yosemite cases which the Federal Courts passed on, and deprived settlers of thousands of dollars invested in improvements.

I notice that the Commission is defending its action through the Eastern press. It does not deny that interests already established will be injured, but declares its purpose to prepare plans for the widest uses of the reservation compatible with the preservations of the "forests;" but unfortunately in the meantime business interests must come to a standstill, owing to their oversight. Western people realize that when public lands are withdrawn from entry that no personal liberty or rights can be exercised therein except by permission of the Department, which past experience has shown to consist of a slow process of red-tapeism. Hence this little oversight or matter of neglect on the part of the Commission caused locators and other interested persons to suspend operations pending an examination of the situation.

The Commission further excuses itself by citing the action of California in declining to have its reserve opened. But if the members of the Commission have given the matter examination they should have recognized that the California reserve is a *bona fide* forest reserve whose timber and scenic effect constitutes its principal value. By its admissions and acts the Commission stands convicted of blundering in the matter, with neglectful consideration of the rights of people concerned; hence the order of reserve should be revoked to make place for a further consideration of a reserve that shall be properly and justly made whereby the rights of persons shall be protected coexistent with the reservation.

The people residing in the Puget Sound country favor public reservations when properly made. They will advocate the setting apart of such scenic regions as are embraced by Mts. Rainier, Baker and Olympus as public parks or preserves for the protection of the fast disappearing fauna of our country. They would also favor the setting aside of a portion of the dense forests of giant firs, such as are seen on the Snoqualmie and Skagit rivers, to preserve them for their grandeur and beauty, before the unpatented lands on which they now stand pass into the hands of commerce. But they oppose the segregation of mineral lands, rich in gold, silver and copper, and devoid of marketable timber, under a blanket reservation, equal to one-quarter of the State, and designated as a forest preserve.

The Dogs of Madagascar.

AN acquaintance of mine who has just returned from Madagascar tells many interesting stories of that far-away land of trouble, but being a great admirer of dogs he never tires of dwelling on the remarkable intelligence of the nondescript curs that infest the island.

"Like the dogs of Constantinople," said he, "they know no owners, permit no familiarities and make no friends. They are self-reliant scavengers, with all the cunning and intelligence that chronic hunger inspires. They are nomadic in their habits, and always travel in large packs, sometimes traversing great distances in an extraordinarily short space of time.

"The island is cut up by a great number of deep, sluggish streams, and pestilential swamps which are infested with crocodiles and caymans. These voracious reptiles don't want a better dinner than a stray dog, and no one knows that any better than the dogs themselves. When a pack of marauding canines come to a stream, they know that they have to resort to strategy in order to cross in safety; so the whole pack get together, and they bark and howl and bark furiously for several minutes. A crocodile or an alligator that has slept for a month will wake up as soon as he hears a dog bark, and commence a still hunt for the dog. The result is that every reptile within hearing of the yelping pack hustles up as near as he can approach and waits for one to plunge in. When the river is full of them the dogs suddenly dash up stream about 300yds., plunge in and swim across before the alligators get done snapping their jaws together, and scurry off till they come to the next stream, when the strategy is repeated."—*San Francisco Post.*

Blended Odors.

FLORIDA, March 22.—*Editor Forest and Stream:* The following recountal of an incident showing the acute nose of a pointer dog may be of interest to my fellow readers of FOREST AND STREAM and also to yourself:

My pointer Chummy, sired by Robert le Diable, and given to me by my friend Louis T. Duryea, of Glen Cove, L. I., is a remarkably good dog, and I have had many dogs. He is very rapid and a great finder of quail, and then goes to English snipe—a bird so vastly different that but few dogs are real good or even passably good on both; but he is. He seems to know how fickle the snipe are, and he is as careful as a cat over them, pointing them at distances that shows acute sense of smell.

Getting nearer to the point, I will mention that woodcock have been an almost unknown quantity in Florida, or at least hereabouts; for few sportsmen have seen any, and I only saw one in five years of shooting here until last winter, when we had a regular influx of them in our swamps. Chummy proved fine on them, working close and careful.

Now for my story: Accompanied by my man Jake, we were hunting woodcock in the swamps, when I heard Chummy bark short and sharp. I quickly saw him having a large white and black skunk at bay, which was facing him. I at once called him off, at which the skunk made tracks, putting a tree between us in his run. I ran to get him in sight again, meaning to kill him, for he is an egg-eater. Chummy took my demonstration as an incentive to run in and grab him, which he did, and paid the penalty, for he got it in eyes, nose and mouth. The skunk ran into a shell of a palmetto log about 20yds. long, and Chummy, blinded and foaming at the mouth, made off. We spent some five to eight minutes in locating the skunk in the log, by punching through here and there with a sharp stick. Meanwhile the air, filled with the skunk odor, was so strong as to make our eyes smart like the effect of ammonia. The skunk located, was shot, and, noticing that Chummy was still gone, I called him several times. We concluded he had gone to the wagon or home, and we also started; but went no further than 40yds., when we came on him standing stiff and true on a woodcock, which I killed.

I have often been tempted to write you this story, and now that I have I would like to know if such experience has been known of before. T. B. A.

[In the chicken trials at Fairmont, Minn., in 1882, a dog pointed chickens under similar circumstances. There have been other instances of a similar kind mentioned in the columns of FOREST AND STREAM, though they occur but rarely]

The Catahoula Hog Dog.

A FEW weeks ago we had occasion to publish on the authority of our friend, Col. E H. Lombard, a very interesting narrative regarding the celebrated hog dog of Catahoula, and so remarkable were the performances of this dog as related to us that many of the deacons of the church, as well as personal friends of Col. Lombard, did him the injustice to class him as a romancer. We are glad to be able to state, however, that Col. Lombard's story has been corroborated in every particular by no less an authority than Mr. Wash Wiggins, one of the best-known citizens of Catahoula parish. Mr. Wiggins says, and he has signified his willingness to be quoted, that the hog dogs of Catahoula are the most intelligent animals on the face of the earth, and as their ancestors before them were hog herders, they take to the work without any training whatever.

It is claimed that the wild hog of Catahoula is second only in the matter of pugnacity and ferocity to the roaring tiger of the Bengal jungle. In order to get a drove of these hogs into a pen the hog dog of Catahoula, as Mr. Wiggins informs us, operates as follows: Keeping always in mind the direction of the pen or corral, the dog goes into the woods and flushes a drove of hogs Then keeping himself invariably in front of the hogs barks forth a challenge; the hogs accept the gauge of battle and make a dash for the enemy, and the dog, tucking his tail—if fortunate enough to have one, which is seldom the case—skedaddles toward the pen, regulating his speed so as to save at all times a distance of about 30yds.

Should the hogs halt in their pursuit, the dog returns and renews his dare, and again he is charged, and again he slopes. In this way he lures the hogs on, until in their mad chase they follow him through the open gate into the pen, when he immediately proceeds to jump the fence on the opposite side, while his master, who has been seated on the fence during the pursuit, whistling and shooting tobacco juice at passing bumblebees, hurriedly climbs down and closes the gate on the entrapped porcines. The faithful and intelligent dog, which is found nowhere else but in the languorous shades of the Cataboulan wilds, is rewarded with a pone of corn bread, and the next day there is a great hog-killing time, followed by feasting and revelry —*New Orleans State.*

Gordons at St. Louis.

DWIGHT, Ill., March 28 —*Editor Forest and Stream:* I am not in the habit of paying any attention to what the reporters say in regard to our Gordon setters. Mr. P. H. Bryson, in his report of the St Louis show, is either prejudiced against the Dwight Kennels or he does not know a good Gordon setter when he sees one. Heather Lad has been shown since '93, defeating every dog that has ever been shown against him under A. K. C. rules, and he has the best record of any Gordon setter in America.

Dwight Grouse, he says, is a very poor specimen. Dwight Grouse was good enough to win first in puppy and first in novice classes at New York in '96, and all the sporting papers claimed he was an extra one. He also won second at Boston in a class of nine. He won first in St. Louis and first in Chicago, where they claimed the Gordons to be extra good. A. L. ORR.

And Good Riddance.

IT is reported that old age has made an end of a bloodhound known as Old King, at Butte, Mont. The dog was owned by "Uncle Dick" Sutton, with whose "Uncle Tom's Cabin" Company the animal had traveled all over the world. It was so thoroughly trained that if anyone began to recite the lines of the play it would go through its old part.

Dixie Red Fox Club.

WAVERLY, Miss., March 31.—*Editor Forest and Stream:* The third annual meet of the Dixie Red Fox Club will be held at Waverly, Clay county, Miss., on Nov. 1, 1897.

G. V. YOUNG, Sec'y.

American Kennel Club.

A MEETING of the Executive Board of the A. K. C. was held in the club rooms, 55 Liberty street, New York, on April 6. There were present Messrs. Hunnewell, Jr. (Chairman), Watson, Schellhass, Bloodgood and Wilmerding.

The matter of the St. Bernard Club, of California, in its official intention to boycott the San Francisco Kennel Club's show, was first taken up. The official communications were read. Mr. H. T. Payne, secretary of the Pacific Advisory Board, on March 25 was notified that said contemplated boycott was illegal, and he was instructed to notify the St. B. C. that if it did not rescind its boycotting resolution on or before March 30, the Pacific Advisory Board was directed to serve notice of suspension on it and its officers. On March 27 the A. K. C. was notified that the St. B. C. refused to rescind, and appealed from the action of the Pacific Advisory Board. The latter was then instructed by the A. K. C. to suspend the St. B. C. at once. On March 28 the Pacific Advisory Board reported that the St. B. C. was suspended, and notice served accordingly on its officers. On March 29 the St. B. C. notified the A. K. C. that it had consulted with the San Francisco Kennel Club, and had unanimously rescinded its boycotting resolution. On March 29 the Pacific Advisory Board was instructed by the A. K. C. to remove the St. B. Club's suspension. On March 30 the Board removed the suspension as directed.

In regard to the penalties concerning incorrect entries in bench show catalogues, the club ruled as follows:

That the forfeiture of deposit money in the cases of all shows held subsequent to September, 1896, be regulated by

such action as may be taken by the A. K. C. at its next meeting regarding any amendments that may be recommended by the committee on rules, to which the matter is hereby referred.

The following kennel names were granted: Cairnmuir, to G. M. Carnochan; Franklin, to Summers & Zelt; Sunnycroft, to Mr. and Mrs. Woodruff Sutton; Hempstead Beagles, to Kernochan & Stevenson, conditional upon obtaining consent of Thomas H. Terry.

The champion classes at Baltimore were ruled upon as follows: That the title champion can only be acquired in the manner provided for in the American Kennel Club rules, and that the title of champion classes at Baltimore be ordered changed to special classes. That the medal be in accordance therewith, and that the winners be notified of the change of title.

It was resolved that the secretary of the Bull Terrier Club be directed to show cause why the club should not be expelled for causes prejudicial to the welfare of the American Kennel Club.

Concerning the Scottish Terrier Club's specials at New York, there having been no public notice given in regard to these specials, it was ordered that the awards made be cancelled.

The Stockton Kennel Club, Stockton, Cal.; Northwestern Kennel Club, Minneapolis, Minn.; Oakland Kennel Club, Oakland, Cal., were admitted to membership.

It was ordered that the action of the officers of the A. K. C. in suspending the St. B. C. of C. and subsequent proceedings leading to reinstatement were indorsed and approved.

Winnipeg Bench Show.

WINNIPEG, April 2.—*Editor Forest and Stream:* I inclose you herewith a list of the prize-winners of our local bench show held last week and trust you will find room in your valued paper for its publication. Our secretary was to have attended to this, but I have just found out he neglected to do so. It was the first attempt of our young Association and was a decided success, both financially and otherwise. The object of the Association is to promote the purely amateur element, and so far we have been most successful, both in field trials held last summer and the present bench show, where our entries numbered over 200—no cash prizes being given. Our setters and pointers were very good, but some of the other classes, noticeably the St. Bernards, would stand improvement.

POINTERS.—*Dogs* (over 55lbs): 1st, N. di Marco's Portia; 2d, B. Gordon's Buster; 3d, E. R. T. Rowan's Croxteth Ole. *Bitches* (over 50lbs.): 1st, J. Howden's Dutchess; 2d, W. Van Vliet's Lena. *Dogs* (55lbs. and under); 1st, W. Whyte's Hal; 2d, Dr. M. Clarke's Brownie; 3d, F. G. J. McArthur's Flingo Stray-deway. *Bitches* (50lbs. and under): 1st, F. G. J. McArthur's Mingo Kent; 2d, F. E. Green's Fan; 3d, F. Collier's Fly. *Puppies:* 1st, W. McMillan's Shot; 2d, A. C. Patterson's Jim; 3d, F. E. Green's Fan. Best kennel, A. C. Patterson's three pointers. Best dog or bitch owned by a member of the Manitoba Dog Owners' Association—1st, W. Whyte's Hal; 2d, B. Gordon's Buster.

ENGLISH SETTERS.—*Dogs* (over 55lbs.): 1st, Climo Kennels' Prince Rupert; 2d, C. Graham's Gladiator; 3d, W. Plaxton's Nero. *Bitches* (over 45lbs): 1st, F. W. Weir's Kan; 2d, Collier & Taggert's Gray Lass; 3d, C. A. Boxer's Qu'Appelle Belle. *Dogs* (55lbs. and under): 1st and 3d, Climo Kennels' Larrican and Doc York; 2d, J. O'Donohue's Manitoba Toss. *Bitches* (45lbs. and under): 1st, Chimo Kennels' Ortolan; 2d, Titania; 3d, Winnipeg Kennels' Lady Bell. *Puppies:* 1st, H. R. Garwood's Master Mark; 2d, H. S. Rolston's Count Cambria; 3d, F. W. Scott's Mark. Best kennel—1st, Chimo Kennels; 2d, Winnipeg Kennels; 3d, George Carle. Best dog or bitch belonging to a member of the Manitoba Dog Owners' Association, Chimo Kennels' Larrican.

GORDON SETTERS.—*Puppies*: 1st, M. W. Canniff's Lady; 2d, Joe; 3d, Hugh. Best kennel, M. W. Canniff.

W. C. LEE.

Some Results of Ear-Cropping.

ANY one who has heard the "megaphone" must have wondered at the extraordinary power of increasing sound that is produced by form; and I would like to call attention to one point in connection with cutting dogs' ears that I do not remember to have seen mentioned anywhere—that is, from an acoustic standpoint.

I have lately purchased a small Yorkshire terrier, imported from England only a few months ago. Its ears were clipped in England, after what the seller of the dog declared to be "the very latest style."

The ears were first clipped and then stiffened up, with three effects on the dog:

First, that the buzz of a bee or fly causes him to retreat under cover of safety.

Second, that he ducks his head when about to be patted, a sure sign of the length of time the pain of the operation must have lasted.

Third (an effect I had not expected), that he has absolutely no idea of the direction of sound.

In the ears of a mastiff dog, any one who observes the shell-like form of the ear-opening may easily imagine the immense power of such a trumpet-like instrument to increase the volume of sound. A change in the acoustical arrangement of the flap of the ear would necessarily entirely puzzle and bewilder the owner as to the direction of sound, and this one point on ear-cutting would seem of itself to condemn the practice.—*A. M. P. in Our Animal Friends.*

POINTS AND FLUSHES.

Under date of March 29, Mr. Frank Richards writes us as follows: "Del Monte dogs are in the pink of condition. Minnie T. was recently bred to Tony Boy, and Betty B. to Count Gladstone IV. With this breeding of such noted individuals the very best stock should be produced. I have finished my work here for the present, and shall soon depart for Stewart, Minn., where I will remain until July, when I shall move to Manitoba to begin work on chickens, and prepare for the Manitoba and Continental chicken trials. All of the other trainers have gone North except myself. George Gray went on the 15th; George, my brother, and Johnson, Buckle and Rose have all given the high water the slip. If it continues to rise I will have to engage a flat-boat."

Three judges and a professional Eastern superintendent, Spratts Patent wire benching, $10, $5 and $2 for cash prizes, dozens of great big silver cups, hundreds of gold medals, and $3,000 for a guarantee fund, are some of the indications of the tidal wave in San Francisco dogdom.—*Field Sports.*

A printed report of the governors' meeting of the American Fox Terrier Club, held Feb. 22, can be obtained of the club's secretary, Mr. H. H. Hunnewell, Jr., Boston, Mass. The treasurer's report shows a credit of $803.31. The club has also issued a circular letter setting forth the purposes of the club, the advantages of membership in it, etc. All who are interested in fox terriers should avail themselves of the opportunity to learn of the benefits to be gained by membership and of the good work accomplished by the club.

It is gratifying to know that the St. Bernard Club at last did a sensible and just action, even though said action was brought about under great pressure. Nevertheless, that is no bar now to think freely over matters at last which it should have thought over freely at first.

Mr. J. J. Lynn, secretary of the International Fox Terrier Club, Port Huron, Mich., writes that the dates of the club show have been changed and will be given later. This action has been taken to avoid conflicting with Toronto and Minneapolis.

Wheeling.

Communications for this department are requested. Anything on the bicycle in its relation to the sportsman is particularly desirable.

DEER, DUCKS AND A BICYCLE.

LOCO, I. T.—*Editor Forest and Stream:* On Oct. 15 I decided to spend a day among the bluebills on Mud Creek. I arose early the following morning, and taking my little hammerless and a lunch mounted my wheel and started for the creek, ten miles distant.

It was dark at the time, and I lit my lamp and pedaled along quietly till the first streak of dawn appeared, when I dismounted and blew out my lamp. Daylight found me speeding along a smooth road "treading the wind" to the music of the familiar click of the chain and the songs of many birds, and wondering why there were not more bicycle cranks. The real unalloyed pleasure of a country spin in the early morning hours must be felt to be understood.

I soon reached the lake, and found the ducks in countless numbers. Selecting a good position, I awaited my chance, which was not long coming. Almost at once a nice bunch came swinging by. I took careful aim and pulled, the old American wood popped, and I distinctly saw my duck double up in mid air. Quickly covering another, I pulled again, with the same result. For two hours or more I kept up a fusillade, after which the ducks seemed to draw off, and the best of the morning shooting having passed I got on my wheel again and started down the creek, hoping to find some squirrels.

I had only gone a short distance when I heard some hounds running off to my right. I happened to think that Uncle Pomp was out that day after deer, and I knew the game was heading for a crossing about a mile down stream, so at once I started at a lively gait, hoping to intercept it.

The land was a sort of overflow, and was rough and hard riding. I could hear the hounds coming at full cry, and forgot all about my wheel and the road and put forth my every effort in trying to reach the crossing first. It was a up and tuck race, and I knew it would take the hardest kind of riding to intercept the deer. On I sped, not looking where I went, through bushes, briers and mud holes, over limbs, chunks and logs. Coming in sight of the crossing, I checked my wheel as quickly as possible, and jumped off and stood behind a tree. I had hardly time to get my breath when I saw the deer come dashing down the bank. The next instant I raised my gun and pulled both triggers together, sending 2¼oz. of No. 4 shot into his side. He dropped his tail and went dashing on, and the dogs swept by like an avalanche.

Their cry soon after ceased, and I knew the deer was down. Uncle Pomp and three other men rode up just then. Uncle Pomp sung out: "Hello, Whit, did you shoot that deer?" "I shot at him," I replied, "but I'm not sure whether I hit him." "We'll soon see," said he, as he forded the creek and disappeared in the direction the deer had gone. He soon returned with a nice four-prong buck behind him on his horse. "How in thunder did you ever get here?" he asked, "I thought you were up at the lake."

I explained to his satisfaction my quick ride, and his wonder then changed to surprise that I had been able to make it without breaking my neck.

The men took the deer, promising to leave a good part at my house. After they left I ate my lunch and then returned to the lake, where I had good shooting for several hours. Upon counting my bag I found I had forty-three bluebills, eight mallards and three canvasbacks. I tied them on to my wheel, and, though heavily loaded, sped along homeward without difficulty. WING SHOT.

To be Taken with a Grain of Salt.

TIME flies and the world moves. In the spring of 1892 one of our largest bicycle manufacturers spent thousands of dollars publishing an advertisement that read as follows:

"Before selecting your bicycle for the coming season be sure that you are right on the tire question. * * * Remember that makers who failed last year with their cushion tires are trying to divert attention by offering so called pneumatics, which are mostly *inflated hose pipes.* * * * Remember that nothing can be devised to compare with the—cushion tire."

That was only five years ago, and yet to-day this very manufacturer is one of the strongest advocates of the "inflated hose pipes." Though no prophet, he was shrewd enough to find out in time his mistake, and he dropped cushion tires as if they had been hot potatoes.

The thousands of people who bought wheels fitted with cushion tires, as a result of their confidence in his statement, when they might have had the vastly better pneumatics, suffered, of course.

They had taken the word of a man who ought to have known, but who did not, and bumped along on the old hard tires when they might have been comfortable on the newer invention.

There is a moral in this. Unobtrusive excellence suffers by contrast with blatant mediocrity. Many of the best bicycles to-day are not widely known, while others of only moderate merit enjoy a large sale. Last year, for example, a manufacturer of world-wide reputation turned out a large number of poor wheels.

The fact leaked out early in the season, and people who keep posted in such matters advised their friends to have nothing to do with this particular wheel. The bicycle was lavishly advertised, however, and despite its known faulty construction had a wide sale.

Frames came to pieces, spokes broke and bearings wore away on the slightest pretext, yet the wheel continued to sell, and many of the deluded buyers actually believed that all bicycles were built that way, and were content to lose the use of their wheels for weeks at a time while being repaired because of their faith that the ——— was the best wheel made—a faith, be it noted, implanted and fostered by the remarkably clever advertisements of the manufacturers.

The people who advertise most will sell the most wheels, but they do not always sell the best. Also, the best wheel made will never sell unless advertised. Also, it is not always wise to be influenced by the statement of one manufacturer. The majority are much less apt to make mistakes than individuals, as is illustrated by the case of the man who had the cushion tire and advertised that nothing could be devised to compare with it.

WHEELING NOTES.

THE Manhattan Elevated Railroad has begun carrying bicycles on certain trains in New York city. At present the service is limited to the S xth avenue line and to half hourly special trains running morning and evening on Sundays only. A small additional charge is made for carrying the wheels, but the service is bound to be popular, as it opens up the fine systems of good roads on Staten Island and parts of New Jersey that have heretofore been practically inaccessible to many riders living in the upper part of the city.

Ladies especially have objected to the long ride through the city necessitated in going to and from the down town ferries, and as the distance for the round trip often foots up to twenty miles the objection is not to be wondered at. Previous to this action, the Manhattan Company has permitted the carriage of wheels on their trains on the same terms as other merchandise. New wheels or parts have been carried in rear cars, and sometimes sharp-witted riders in distress have taken advantage of this fact, and by taking apart their wheels gotten them admitted to the trains.

Screws and nuts sometimes contract a habit of working loose even in the best regulated bicycles. A cure for this ill is to sprinkle a little powdered rosin over the thread or else to dip the threaded part in melted tire cement. Sometimes a loose pedal may be held in place by screwing on with a small piece of soft wire laid across the thread. This is not successful, however, when the thread is badly stripped.

Smoking lamps and lamps that will not stay lighted are one of the banes of the city wheelman's life. The lamp must be clean and the air passages unchoked to insure a steady flame. Another point to remember is to keep the wick trimmed with a hollow in the center, as smoking always results when the flame runs to a point.

A correspondent in Montreal asks for the address of a manufacturer of bicycle boats either in America or England.

Cyclometers this year are being made to register not only the total mileage for the season, but also the distance covered in single trips. They are so arranged that the trip figures can be set back each day to zero without interfering with the regular register.

As a result of the protest made by the associated cycling clubs through their spokesman, Police Magistrate Simms, it seems reasonably certain that the asphalted streets of New York will be in better condition this summer for riding than ever before. General Collis, Commissioner of Public Works, has notified the Street Sprinkling Association that hereafter all sprinkling of streets, roads and avenues and public places paved with asphalt must be done before 8 o'clock in the forenoon of each day.

Wheelmen who have suffered from the slimy, dangerous pavements in time past will appreciate this action.

One of the many improvements to be credited to the bicycle is the modern road book, which is a distinct advance in the art of map making.

In the best of the forthcoming books for 1897 detailed information is given as to the condition and character of roads, height and grade of hills, points of interest along the commoner routes, etc., as well as directions for crossing cities that lie in the way of the wheelman. Such information is invaluable to tourists, and horse owners and pedestrians alike profit along with the cyclists.

Wheel insurance companies assert that more than 17,000 bicycles were stolen during 1896.

Women cyclists more than men need to learn a good ankle action in riding.

Women like to appear well on bicycles as elsewhere, and it is an absolute impossibility for them to do so if they ride flat-footed. Nothing is more ungraceful than the up and down motion of the lower limbs of such riders, and the ungallant comments often made regarding women on the bicycle are the result.

The fair rider, if she wishes to fill her mission in the world, and add her natural quota of brightness and beauty to life, should have her saddle adjusted so that she can just reach the pedal at its lowest point with the ball of her foot. Then, if she is of the right metal, she will soon learn to rise in her toes as she would in dancing, and her knees will no longer be thrown out in front like cats fighting in a bag.

Beauty awheel is dependent upon rhythmic motion with the least perceptible indication of muscular effort.

It would be a good thing if some of the dancing masters who find the times dull on account of the bicycle craze would turn their attention to instructing ladies in wheeling.

Bicycles are baggage now in California and Arizona. The number of other States that have recently adopted similar legislation is large, and it looks very much as if there would be no States without bicycle baggage laws in another year or two.

Yachting.

AT the recent conference in Boston of the representatives of the Massachusetts Y. R. A. and the Long Island Sound Y. R. U., it was decided to call a conference of representatives of the various associations at the end of the racing season, on Oct. 1, with a view to the organization of a national association. Since this decision was reached a change has been made in the plans, and it is now announced that the conference will be held at the beginning of the season at the Fifth Avenue Hotel, on May 1. Invitations have been extended to the different associations, and also to some clubs not connected with any association. It is uncertain as yet just what action may be taken, but the meeting is likely to lead to the formation of a national association either at once or after the close of the racing season.

A VERY interesting experiment has lately been made by some members of the Seawanhaka Corinthian Y. C. in the racing of a 15-footer in Bermuda waters against the local boats, considered invincible by the natives. Messrs. D. Le Roy Dresser, Irving Cox and F. M. Hoyt visited Bermuda last month, taking with them the fast 15-footer Paprika, designed and built last season by L. D. Huntington. At Bermuda they discovered another member of the club, William Whitlock, who had been spending the winter there. During their short stay Paprika was sailed against the local 15ft. boats of much greater sail area with marked success. The boat was left in Mr. Whitlock's hands for a final race, which she won, and has since been shipped back to New York.

The Measurement Rule.

THE following letter comes to us from Mr. G. R. Lüjegren, of Gothenburg, Sweden, and deals with a subject that is just now of great interest to yachtsmen, as it is evident that some improved form of measurement rule must be had in the near future:

This question of a suitable measurement rule, which is a daily subject of discussion among nearly all persons interested in the sailing sport, seems in all methods of measuring as yet proposed to aim only at rendering it impossible for the fin-keels to dominate the racing courses and to capture most of the prizes. Certainly nobody will deny this object to be a just one.

All the rules of measurement known to-day have approached more or less this end, but by ways which, to my belief, are not the right ones; for instance, the Danish (Benzou) rules and the new English rule.

The rule I now wish to propose is, for aught I know, the only one of its kind either in its practical composition or its theoretical correctness.

The formula for the corrected length or racing length is:

$$R.L. = \sqrt[3]{\frac{S.A \times L.^2}{C.P.}} \quad \text{or} \quad \left(R.L. = \sqrt[3]{\frac{S.A \times L.^2}{C_1 D.}}\right)$$

Here R. L. signifies the racing length; S. A. the sail area, measured according to the usual method; L. the length of load waterline; C. and C_1 constants; P. the area of midship section, measured on the drawing or from the yacht on land and controlled by the position of the yacht in water; and D. the displacement expressed in cubic feet.

As to the theoretical correctness of the formula, I beg to quote the following proposition, known to most theorists: "If two yachts are constructed from the same drawing on different scales, their speed will be in direct proportion to their respective $\sqrt{L.}$, if they are provided with sail areas proportionate to their respective $L.^3$" Their resistances grow as $L.^3$ (Froude), hence S. A. must vary as $L.^3$ under the above conditions, for S. A.=driving power=resistance.

As is easily seen, the racing length of the yacht grows directly as the length and sail area, but, on the contrary, inversely as the area of midship section; that is, the smaller the midship section, the greater the racing length. This is the reason why, for instance, fin-keel boats, light centerboard boats and modern light keel yachts (bulb-keelers with wooden fin) have so great a racing length, whereas those of greater body have a considerably smaller measurement.

The table following, in which the proportions between different types and sizes are compared in accordance with my system, the Y. R. A. rating rule and the Seawanhaka system, presents very remarkable figures.

It, for instance, appears that the fin-keel boats Vencedor, Commodore, Blenda, Yum Yum and the Martin craft, as well as the centerboard boats Ostsee, Yohanna, Glencairn and El Heirie, and the modern keel yachts "New Yacht" and Garm, have a considerably, not to say immensely, greater racing length by the system now proposed by me than by either the American or the English systems.

The area of midship section of both Blenda and Yum Yum are only calculated, not measured; yet I venture to declare with decision that the numbers expressing their respective areas are not too small, rather the reverse.

Careful attention should be given to the respective figures of Ariadne, Perkun, Thora, Aura, Carmen, Viola, Vira, all yachts of very different types, although not one of them has a modern, small midship section or very limited displacement.

In Sweden I have been met by the objection, that the midship section is not measurable in the water, but in reply to that I will remark that a simple machine for such measureing certainly could be easily constructed and would give very exact results, as exact as is practically required; for an error of some square inches would, no doubt, be of little importance in the practical use of the system, when, for instance, the sail area is measured according to the method now customary.

The time allowance is, in my system, equal to the whole difference between the respective T; and T is equal to

$$\frac{3600}{1.1.\sqrt{R.L.}};$$

that is, the theoretical normal speed is equal to $1.1.\sqrt{R.L.}$

By comparing calculations I have in the first formula for R. L. fixed the constant C. = 1.48.

In the English system the time allowance is equal to the difference between the respective T, and T in the tables is the time allowance of the yacht to a 1-rater. If the length over all exceeds 1.5. L.W.L., I would assume L. = L.W.L. + ⅓ [L. over all—1.5. L.W.L.].

Name.	L.	S A	P.	My System. R. L	My System. T.	Old English Rat.	Old English T.	Seawanhaka. R. L.	Seawanhaka. T.

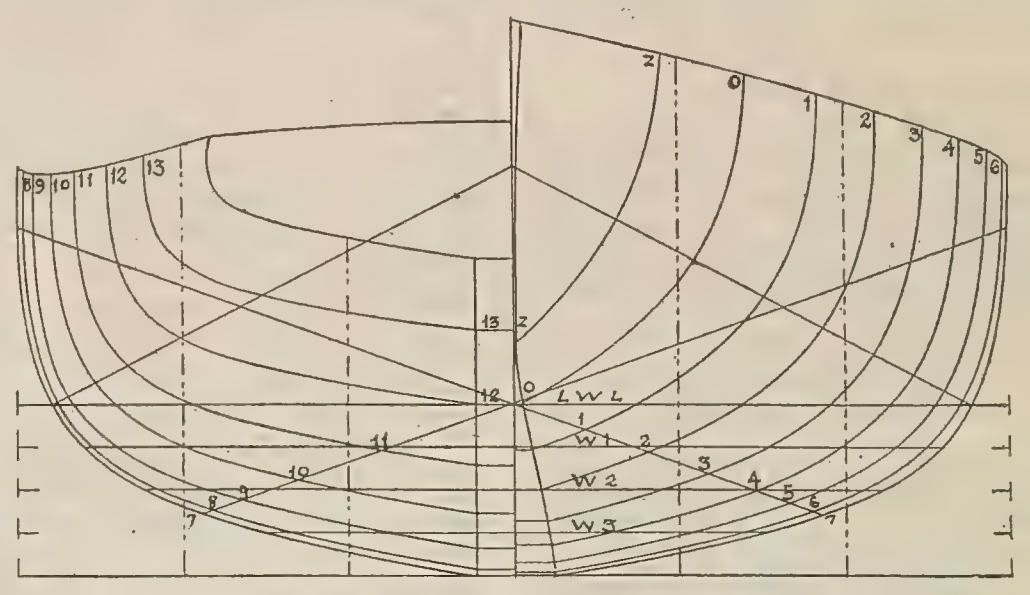
*L.=L.W.L.+⅓ [L. over all—1.5 L.W.L.].

G. R. LUJEGREN.



We are not sufficiently familiar with all the yachts quoted by Mr. Lüjegren to pass a critical opinion as to the exact value of the proposed formula; but short of this we are entirely in accord with him as to the desirability of using either displacement or the area of the midship section, and as a divisor; thus placing a premium upon displacement up to a certain point, with its accompanying advantages in greater internal space. We do not, however, favor the plan of Mr. Lüjegren so far as it places the centerboard type on a par with the fin-keel under the rule, and practically excludes it from the racing. We should prefer to see a formula that would encourage the keel yacht of moderate proportions and good bulk, and at the same time would still give a fair chance to the centerboard yacht of similar qualities. As we understand the proposition of our correspondent, the centerboard type would be penalized so heavily as to bar it entirely from the races.

Dealing with the leading type, the moderate keel boat, we have made some calculations as to the possible operation of the proposed formula in the 42ft. class of the Lake Y. R. A., to which Yama, Zelma and Canada belong. We have assumed the same L.W.L. (37ft.) and S. A. (2,209sq. ft.) for four yachts of the class, with different areas of midship section, the racing length by the proposed formula being as follows:

Midship section.	Racing length.	Allowance.			
16sq. ft.	50.30ft.	Allows.			
20sq. ft.	46.7ft.	3 50	Allows.		
24sq. ft.	44.0ft.	7 01	3 11	Allows.	
28sq. ft.	41.7ft.	9 58	6 08	2 57	Allows.
32sq. ft.	40.0ft.	12 19	8 29	5 18	2 21

The midship section of Canada, a semi-fin, is 22sq. ft. (Mr. Lüjegren's figures for Canada are too high), and of Yama, a cutter of moderate beam and rather large displacement, is 27sq. ft. From this it will be seen that the first example, of 16sq. ft. area of midship section, represents the fin-keel type; the second, a fin of greater displacement; the third, a yacht of strong S-section, such as immediately preceded the introduction of the fin-keel; the fourth, of 28sq. ft. area, a wide cutter of the Minerva type; and the fifth, a narrow cutter, somewhat less extreme than the old lead mine. Assuming that the five were of equally good construction, and that by virtue of appropriate dimensions they all carried sail equally well, the fourth column shows the allowance from the fin-keel to the others in order for a twenty-four-mile course. As far as can be estimated from an inspection of these figures, we should say that in the first place they show that the extreme fin is barred, in the second that they would place the other types on very fair terms of equality. It seems that the end in view—the encouragement of the medium types, as represented by No. 3 and No. 4—would be attained; at the same time there is a fighting chance for the more extreme types on each end. It is doubtful where the moderate "compromise" centerboard type would come in; but, considering all things, it is not likely that this type would be any more successful than it has been under the Seawanhaka rule in competing with Minerva and Gloriana.

Of course this method of comparison is more or less partial and superficial; to cover the case thoroughly it would be necessary to make a sketch design for a yacht of each of the five types to the class limit of 42ft., giving each the proportion of L. and S. A. that the particular type demands, and then to compare their probable performances without time allowance. We shall be glad to hear from any of our readers who may be sufficiently interested to study Mr. Lüjegren's formula further and to test its practicability. The objection mentioned, on the score of the difficulty of obtaining the measurement of the midship section, is of no moment; it seems almost certain at the present time that either displacement or area of midship section—the two being practically convertible—must be an important factor in any new rule; and that, however difficult to obtain, one or the other must be had.

BODY PLAN OF SCHOONER.

A Fin-Keel Cruising Schooner.

THE yacht whose lines are here presented will be recognized as the sister to two yachts already illustrated in the FOREST AND STREAM, Paralos and Palmyra. This peculiar type of fin-keel, of limited draft, full body and great internal capacity, essentially a cruiser in its characteristics, has for several years been a subject of special study with the two gentlemen who are responsible for the present design, Mr. George B. Wilbur, of Taunton, Mass., and Mr. Wm. F. Palmer, formerly of Taunton, but now of Malden, Mass. These gentlemen, both amateurs, have worked together in their designing for some years; Mr. Wilbur getting out the lines, while the calculations are made and the details of cabins, fittings, etc., are arranged by Mr. Palmer, who has owned and cruised in both Paralos and Palmyra.

The new design is the result of a very satisfactory experience in the previous craft, and is similar in form, but in rig she is a decided novelty. The sail plan, which we will publish next week, shows what might be called, according to some of the absurdities of yacht nomenclature, a "cat schooner." Absurd as such a term is, it has its parallel in the terms "cat yawl" and "cat sloop." The rig is certainly a schooner, but the foremast is stepped just forward of the waterline, as in a catboat; the mainmast being in the center of the waterline.

The dimensions of the yacht are:

Length over all	45ft. 9in.
L.W.L.	32ft.
Overhang, forward	6ft. 9in.
aft	7ft.
Beam, extreme	13ft.
L.W.L.	12ft.
Freeboard, bow	5ft.
stern	3ft. 6in.
least	3ft.
Depth, rabbet to plankshear, midships	5ft. 5in.
Draft, hull only	2ft. 3in.
with fin	5ft. 4in.
Displacement, to designed L.W.L.	9.67 long tons.
Fin and bulb, cast iron	5.72 long tons.
Midship section, area	19.50sq. ft.
from stem	18.66ft.
C.B. from stem	17.60ft.
Lateral plane, area, hull	46sq. ft.
fin	60sq. ft.
rudder	12sq. ft.
Total	118sq. ft.
C.L.R. from stem, without rudder	15.66ft.
Lower sail area	1,600sq. ft.

With a light scantling and limited interior fittings, the yacht will trim to the designed L.W.L.; but a thoroughly strong and durable construction has been adopted, and the yacht will be completely and comfortably fitted up for cruising service, thus increasing the displacement to about 25,000lbs., the l.w.l. to 34ft., and the draft to 5ft. 6in., with a proportionate reduction of freeboard. The over all length, as actually built and given in the table, is a little greater than that shown in the drawing, both ends having been extended after the first design was completed.

The yacht is building for Mr. Palmer by Wood Bros., of East Boston, and is now nearly completed. The fin and bulb, of iron, are cast in one piece, with wide flanges for bolting to the oak keel, a plan successfully followed in the former yachts. The keel is 12in. wide amidships and 4in. thick, tapering at each end, and is steamed and bent to the required sweep. The fin is fastened with ⅞in. galvanized iron bolts, two to each floor, forty-eight in all; the heads being countersunk in the flanges of the fin and the nuts set up below the top of the floor timber, so as not to project through the floor of the cabin.

The frames are all single, of oak, sided 2in., and moulded 2½in. at heels and 2in. at heads, spaced 10in. Most of them are bent, but some in the counter are sawn from knees. All the bent frames are got out to shape, staylathed and beveled before setting up. On each pair of frames is a floor timber of 3in. oak plank, 10in. deep at the middle, and about 6in. at the ends, the upper faces beveled to take the flooring of the cabins. The lower bilge clamps run over the ends of these floors. There are two bilge clamps on each side; one just over the ends of the floors, the other at the turn of the bilge. The main deck beams are 3 by 4in., the others 2 by 2½in. The planking is of hard pine in single lengths, finishing 1¼in. thick, and the deck is 2 by 1½in. The deck frame is well kneed off with both hanging and lodging knees of hackmatack. Contrary to the usual practice, the rudder will be of wood, with a 5in. locust stock, 27 per cent. of the blade being forward of the center.

The extent and nature of the accommodations can only be understood from the interior plans, which, with the sail plan, we will publish next week.

Important, If True.

THE Chicago *Chronicle* of March 31 is responsible for the following story, for which we cannot vouch:

A syndicate of prominent New York yachtsmen have about closed negotiations for the purchase of Com. Berriman's crack yacht, the Vencedor.

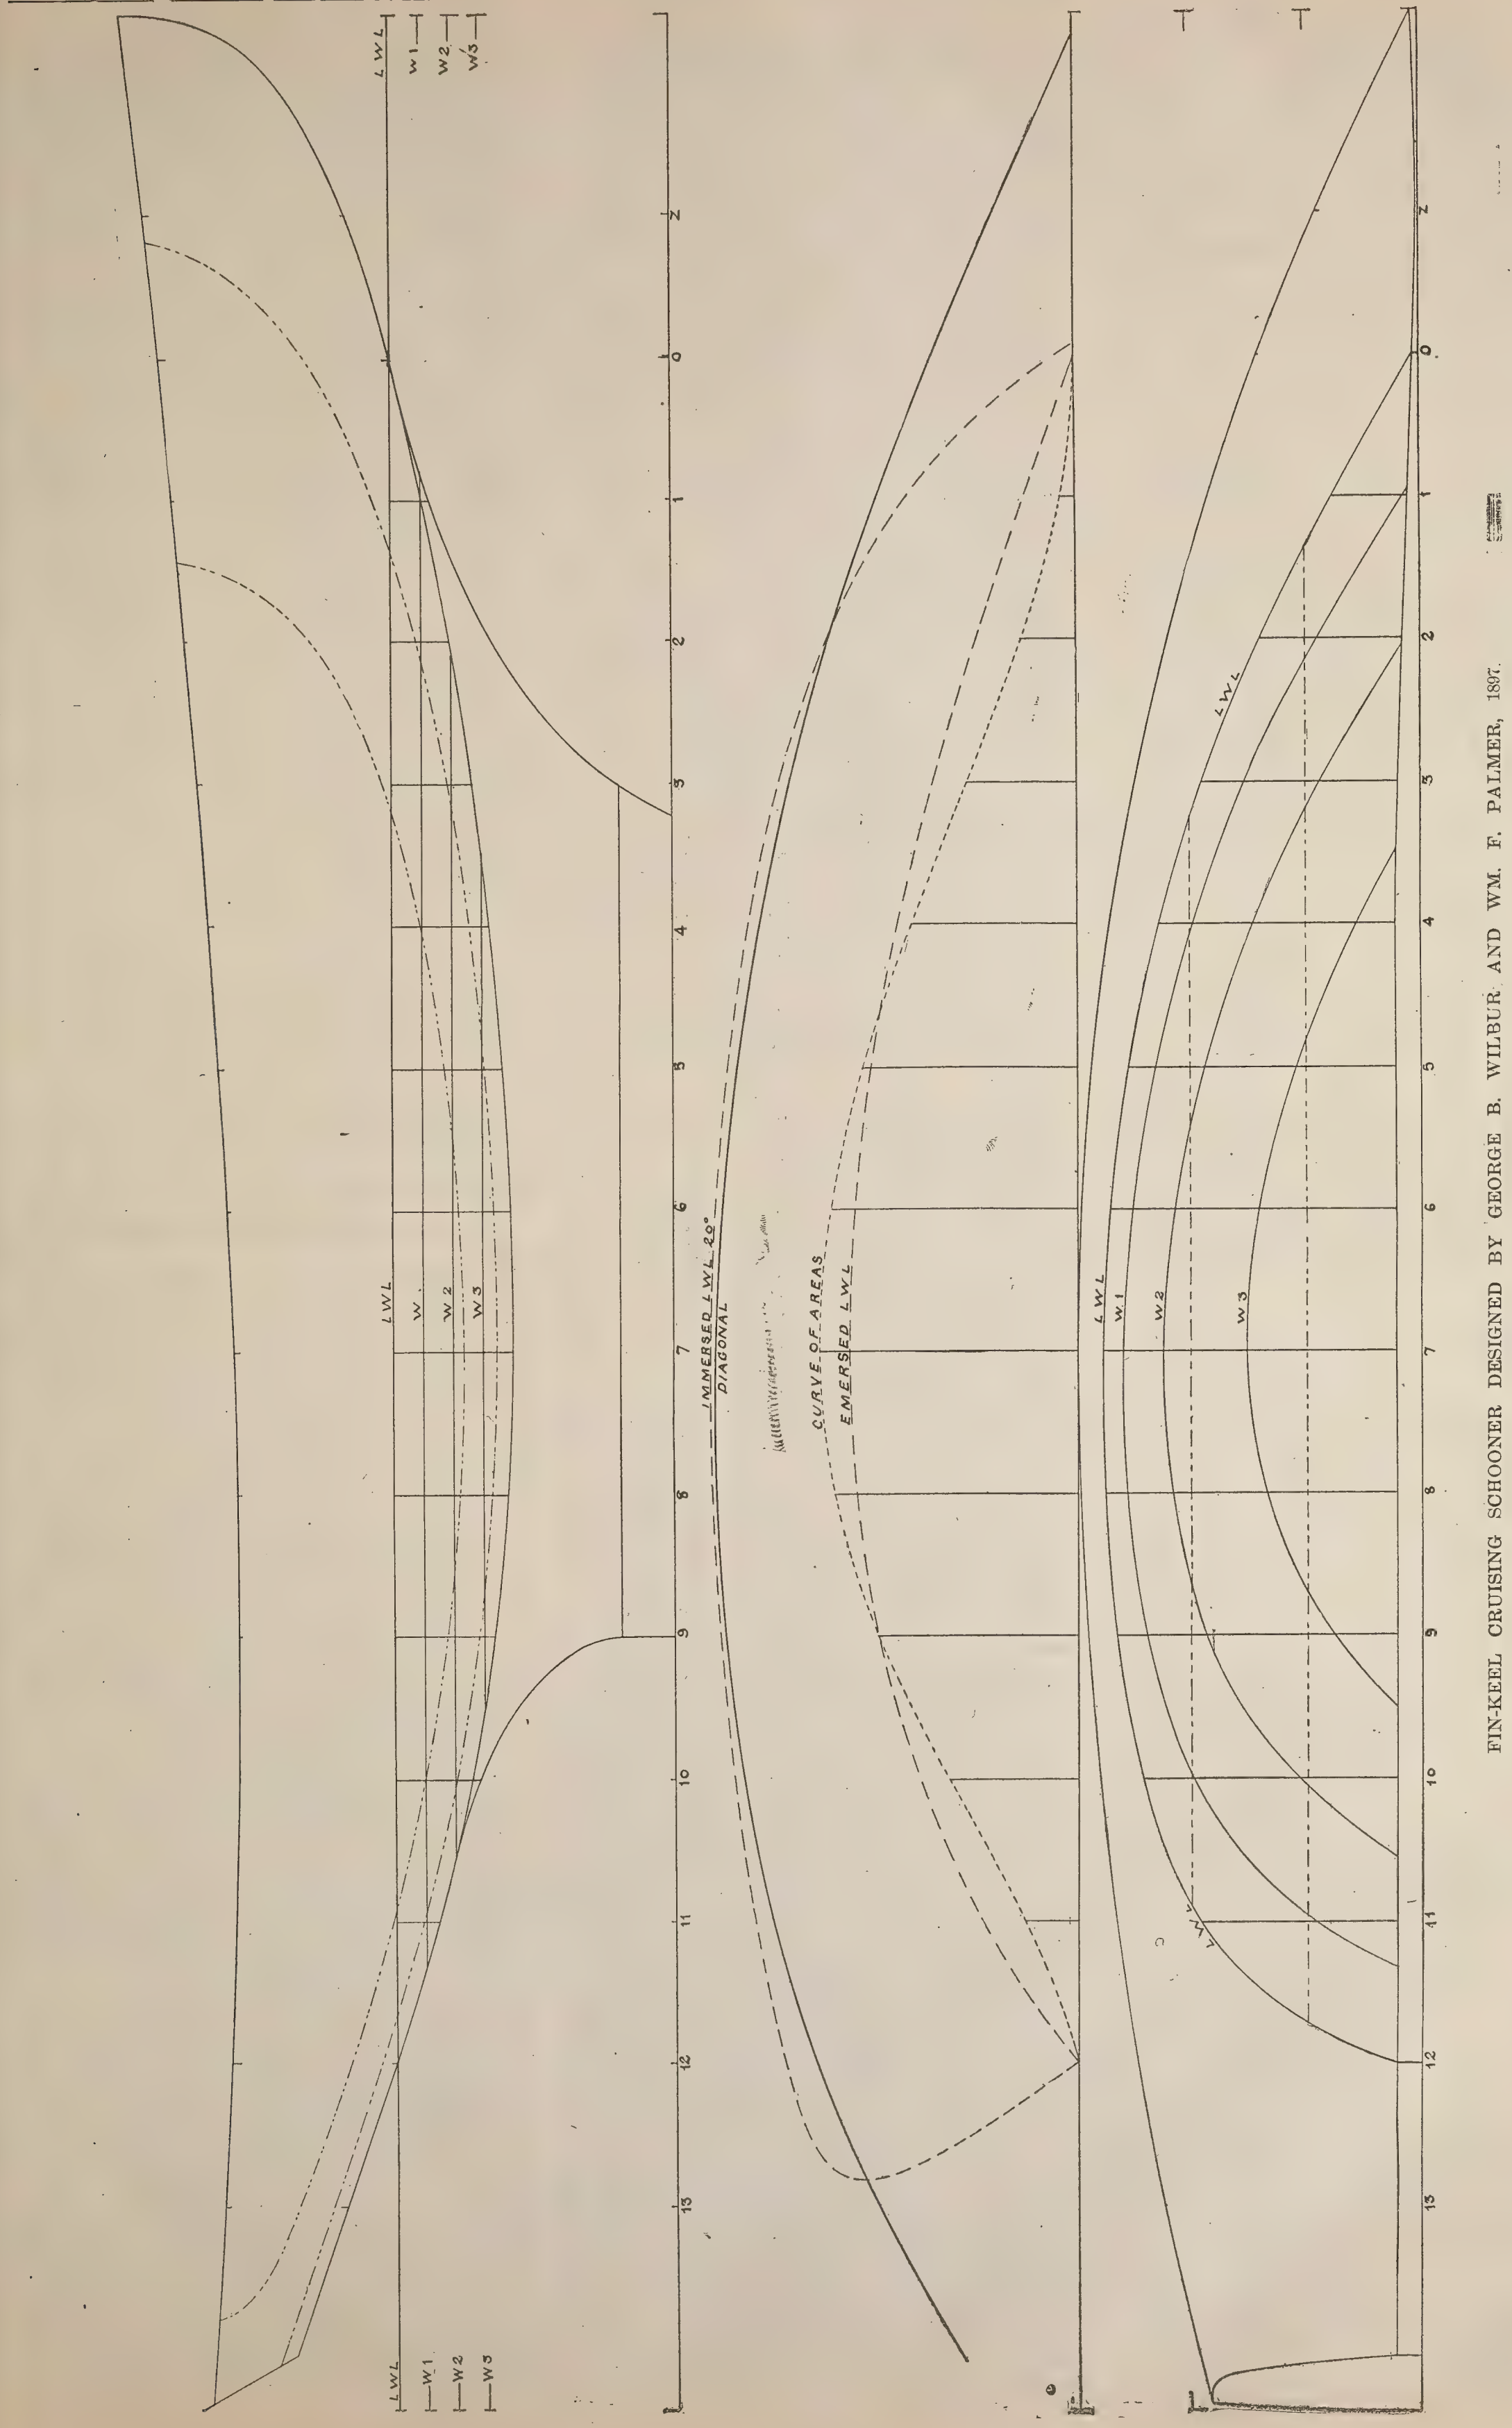
The Eastern yachtsmen want the Western sloop to pit against Howard Gould's fast yacht, the Niagara. There is nothing on the Atlantic coast that can give the Niagara a good race, and the salt-water sportsmen have been forced to lay aside their prejudice and come West for a yacht to test the champion's merit. They have been obliged to do this or build a high-class racer. Aside from the risk attending the latter experiment, the cost of the venture would be a neat sum, for no builder of reputation would undertake to build a yacht to sail against the Niagara except for a fancy price. The quality of the Vencedor is known all over the Lakes, and her reputation for fast work in a heavy sea has traveled up and down the seacoast.

The chances of the Vencedor being able to give the Niagara a race have been carefully considered by the yachtsmen who contemplate her purchase. Aside from what is known of her public performances, the Eastern yachtsmen have been seeking private information concerning her sailing qualities. Poekel, who designed her, advised them that he would go as far as he could in recommending her without giving an actual guarantee. Com. Berriman said he would go further. He agreed to put up a bonus of $1,000, which the purchasers should take if the Vencedor failed to defeat the Niagara in two out of three races.

Both of these crack yachts are of the same general type. The Niagara was the model Poekel had in mind when he designed the Vencedor. He aimed to make a yacht of the Niagara type with a few improvements. He thinks he succeeded, and risks his reputation as a builder of racing yachts when he states in emphatic terms that he believes the Vencedor will have little difficulty in defeating the Gould yacht.

The Niagara is in Europe at present, but it is understood she will be brought over very soon. As a racing machine, both in this country and abroad, she has had an almost uninterrupted line of successes. Out of fifty-two races sailed she has won forty-eight.

Commodore Berriman is willing to part with his fast fin-keel because he cannot get another race with the Canadians for her. Should the pending negotiations be completed, he will challenge the Canadians, and build a yacht to suit their class. They will not sail in the Vencedor's class, claiming she is too big. The Vencedor and the Niagara are well suited to a race in point of size, the Eastern yacht being only 2ft. bigger, racing length. On a twenty-one mile course the Western boat would claim a time allowance of a little more than two minutes.



Yachtsmen will be much interested in noting the performance of a lake yacht over the salt-water courses.

American Model Y. C.

AT the annual meeting of the American Model Y. C., held on April 2 at their rooms, 227 Fulton street, Brooklyn, the following officers were elected for the ensuing year: Com., James H. Lane; Vice-Com., Cornelius Van Ness; Treas., Geo. W. Townley; Sec'y, Geo. F. Pigott; Meas., Frank Nichols; Trustee for three years, J. C. Meyer. Official reports for the past year were read, showing the club to be in a thoroughly prosperous condition. The report on the half models submitted to Mr. A. Cary Smith was read, showing the successful half modelers as follows: O. L. Gray, J. C. Meyer and Frank Nichols.

It was decided to open the boat house at the salt-water station, foot of Thirty-fourth street, South Brooklyn, on April 18, when preparations for a lively season of model yachting will be in order. The club has its eye on the Eagle cup, and intends to have its hands on it as soon as one of the fastest models is selected by the trial races. No doubt Star will make a bold bid for first place, but the race will not be a sail-over by any means, as she will meet some fast boats.

FRANK NICHOLS.

FIN-KEEL CRUISING SCHOONER DESIGNED BY GEORGE B. WILBUR AND WM. F. PALMER, 1897.

YACHT DESIGNING.—XVII.

BY W. P. STEPHENS.

(Continued from page 255.)

BEING provided with a suitable drawing board and a support for it, the next question for the draftsman is what to put on the board to receive his drawing? At the present time drawing paper can be had of every grade, from the coarsest and poorest up to the finest, and practically of any size desired; 6ft. wide by 30, 60, and even 90ft. long are stock sizes, and still larger can be obtained. It is amusing now to read in the old books on drafting minute instructions for scarfing and joining the comparatively small sheets then obtainable, in order to make one large sheet. To-day paper is made in continuous lengths, and of almost any width up to 10ft. or so; some of it being afterward cut into sheets of various sizes and sold in that form, while the rest is cut into convenient lengths of 10, 20 or 30yds., and sold in the roll or by the yard.

The first and most important consideration in selecting drawing paper, and one too frequently overlooked, is economy; and to this end only the very best should be chosen, regardless of the first cost. A sheet of Whatmann's "Selected Best" hand-made paper, of "Double Elephant" size, 27×40in., costs 30 cents, and two thirds of this sheet, costing 20 cents (18×40in.), will be of the right size and proportions for a set of lines. The drawing to be made on this piece of paper will probably require three or four days' time at the least, and an outlay of $15 to $30 for labor. Such paper as is too commonly used—a coarse, rough brown, filled with clay or other adulterant—may cost from 2 to 5 cents for a piece of the same size. Against this saving of less than 20 cents in first cost must be set the loss of time, amounting to many hours, which is due to the coarse and unsuitable surface, the difficulty of making erasures, and the probable spoiling of the whole drawing when it comes to the inking in, as apart from the difficulty of making a pen work at all on such a rough, furry surface, the ink will spread wherever an erasure has been made. On a good white paper the most minute measurements may be plotted; very fine pencil lines may be drawn; erasures, even of ink lines, are easily made without damage to the surface; the inking in may be done in half of the time and with far greater neatness; and the lines of the finished drawing, fine as they are, stand out in bold relief. Even the beginner and the amateur, though he counts his time as of no money value and is desirous of economizing in his cash outlay for materials, will find it the worst kind of economy to purchase paper of a poorer grade than is suitable for the particular work he may be engaged on.

Really good drawing paper can only be made of good materials and by expert workmen, the presence or absence of both being soon detected when a piece of paper is in use. The paper should be strong, so as to stand continual handling, and it should be durable, not becoming brittle or discolored with age. It should be of uniform thickness and even surface; it should shrink or stretch as little as possible, and equally in all directions; the surface should not absorb inks, but it must receive them freely, and must be capable of standing the complete erasure of ink marks and redrawing in ink. For some kinds of drafting it is necessary that the paper should stand the application of water in *washing in* broad surfaces of color, but this is seldom the case in marine drafting. It is not possible to obtain all of these qualities in any one make of paper, but from the very extensive and varied stock carried by the dealers in draftsmen's supplies it is possible to select a paper exactly fitted for any particular purpose.

The drawing of a set of lines for a vessel requires very accurate work, with fine lines and presumably considerable erasure and alteration; for this purpose a thick white paper with a smooth surface is the best. Each maker or large dealer has a series of names for all of his papers, and this class of white papers is listed under such names as "Paragon," "Par Excellence," "Peerless," "Universal," "Anvil," "Linnien," "Hercules," etc.; the first three being the better grades The best of these papers cost, by the single yard, 42in. wide, 45 to 50 cents, or half this price for a piece 18×42in., enough for the average drawing; by the roll of 10yds. they are still cheaper. The sail plan may be made on the same paper, but as it requires less alteration and erasure a lighter grade will answer as well. For preliminary sketches of sheer plan, etc., for details on a large scale, and similar open and simple drawings, the better grades of brown detail papers, costing from 8 to 12 cents per yard, are quite good enough, and of course much cheaper than the first mentioned. For laying off any parts full size, such as the body plan, the cheapest grade of manilla paper is suitable; some of these papers, made for commercial use rather than for drafting, being so cheap when purchased by the roll that they are used on the mold-loft floor for laying down the lines full size.

For sketching and for the amateur's practice in the study of drafting, and in fact for amateur drafting in general, the ordinary linen ledger and letter papers, which may be had in sheets of large size, and of course unruled, are excellent, and considerably cheaper than the heavier drawing papers. They will take ink and will stand a reasonable amount of erasure. They, as well as some of the thinner of the regular drawing papers, may be used for blue-printing direct, without the labor of a tracing, and thus are very convenient.

The roll paper, which may be had in 10yd. rolls of 36, 42, 58, 62 and even 72in. width, is more economical than the sheets, as it may be cut to any sizes desired without waste; it is also convenient to store; but it has one serious objection, it will not lie flat on the board. This may be overcome by *damp-stretching*, as described later, or by rolling the paper the reverse way when the roll is first opened and leaving it for a time, afterward cutting it into large sheets and putting them where they will lie perfectly flat and under pressure. This is advisable with all paper, as it improves with age.

In addition to the heavier papers for original drawings there are the transparent papers and cloth used for tracing, very indispensable adjuncts. The papers are the cheaper, costing about one-third as much as the cloth, and they answer very well for certain work that is not much handled. They are very fragile and easily torn, however, and much less satisfactory to draw on than the cloth; the latter being in every way preferable for tracings that are to be frequently handled or are of permanent value. It is most annoying to spend hours of careful work over a tracing and then in a short time to find the paper tearing at the edges and corners and in a fair way to become worthless. We would impress upon the young draftsman the lesson that it took us many years of practice to learn, that the slight saving due to the use of a poor quality of paper, or of tracing paper instead of cloth, is dearly paid for in the end.

The invention of the blue-printing and other similar but more complicated processes—a comparatively modern improvement—has made the tracing in one sense even more valuable than it was before, though it has decreased the necessity for numerous tracings. In this process it is necessary to have a drawing on some transparent medium, which drawing is equivalent to a photographic negative. This drawing is placed over a sheet of sensitized paper, and a sheet of heavy plate glass is laid over the two; they are then exposed to the bright sunlight for five minutes or so, or for a longer time if the light be less intense. The sensitized sheet, which was originally of a light yellow tint, and after exposure under the tracing has turned to varying shades of blue-gray, is now quickly washed with cold water and hung up to dry. The final result is a dark blue ground with white lines. Other processes give black or very dark lines on a white ground, but they are more difficult and expensive, and for most purposes no better than the humble blue-print. The value of this simple process is almost incalculable; before its invention it was necessary to make a separate tracing from the original for every copy of a drawing, a number being required in large establishments. Now but one tracing is needed; from this any desired number of reproductions can be made rapidly and at a nominal cost.

A suitable selection of paper for ordinary work would include a roll of white paper, what is termed "thick" or "medium" "smooth," cut into as large sheets as can be stowed away; some plain linen ledger or writing paper of various sizes and thicknesses, a roll of detail paper of good quality, tracing paper and tracing cloth.

The almost invariable custom of draftsmen is to fasten the paper permanently to the drawing board, leaving it there until the drawing is entirely completed, when it is removed to give place to a new piece of paper. To follow out this plan, it is of course necessary that there shall be a good supply of drawing boards of various sizes, or else that but one drawing shall be in hand at a time. The paper is fastened to the board either by tacks or paste, the former method being much the easier. Special *drawing pins* or *thumb tacks* are made for this purpose, a large flat head of brass or German silver with a steel point screwed in, not riveted. The usual sizes have heads from ⅝ to ½in. diameter, and points about $\frac{3}{16}$in. long. A cheaper variety, introduced within a few years, has the head and point stamped from one piece of sheet steel; they are quite as good as the more expensive ones. The heads of these tacks stand up high enough to obstruct and sometimes to damage the edges of the T squares and triangles; and a very good substitute for them may be found in the common carpet tack of iron or copper, which will leave the surface of the paper practically unobstructed. In placing the paper on the board it should be trimmed square, the lower side of the paper parallel to the lower edge of the board, and the left side of the paper quite near to the left edge of the board. This side may be fastened with a tack in each corner; then the opposite side may be fastened at the corners, being well stretched, after which other tacks may be placed along all four sides until the paper is held firmly and smoothly.

In some establishments it is the custom to keep a number of drawing boards of such sizes as the work demands, and as soon as one is cleared of a drawing it is covered with muslin, put on the board with starch and tacked around the edges; then a sheet of paper, which may be thinner than that used without backing, is well soaked with water on the back, allowed to expand, covered with starch and placed on the muslin. It is adjusted in position, its edges parallel to those of the board, and then rubbed down with a soft rag, a piece of brown paper being used to protect the damp surface of the drawing paper. Beginning at the center, all air bubbles and wrinkles are worked out, the edges rubbed down hard, and the board is set away to allow the cloth and paper to dry and season thoroughly until wanted for use. This gives an excellent surface, hard, solid and smooth, and the drawing is in shape for permanent preservation; it, however, involves some trouble and also some time, in order that the drying may be complete. When the drawing is finished the paper and cloth are cut around the edges and the cloth pulled off the board.

For some classes of work the paper is best prepared by the process of *damp-stretching*, and the method may fittingly be described here, though it is seldom used in the class of work of which we are treating. The sheet of paper should be cut a little larger all around than necessary for the finished drawing. It is then turned face upward on the drawing board, a straightedge is placed about ¼in. in from one edge, and with a very sharp knife point a cut is made less than halfway through the paper, and the strip is torn off by a steady pull from end to end. The other three sides are now treated in the same manner, leaving the edges of the paper thinner than the rest of the sheet, and also with a rough surface that will hold the paste or glue better than the original smooth back. The edges of the paper, for a width of from ¼ to ⅜ n., are now turned back on to the upper surface and pressed smooth with a paper-folder or hard piece of wood; the paper is then turned face downward and the back is thoroughly wetted with a sponge and cold water, the edge being left dry. After the paper has absorbed sufficient water to make it perfectly soft and pliable the surplus water is sponged off and the sheet again turned face upward. It is now adjusted in place on the board and carefully smoothed out, working always from the center, using a soft rag and a piece of common paper to avoid soiling the face. After the paper is smooth and free from wrinkles, four strips of any common paper are cut and laid under the edges that are folded back to keep the paste from the face of the paper. For securing the edges, *mouth glue*, specially prepared for draftsmen's use and to be had in the stores, is often used; but *dextrine* is still better. This should be mixed with water to a stiff paste and applied freely to the edges that have been turned back to receive it The middle portion of the near side is first coated and rubbed down with some hard tool, such as folder or knife handle, using a piece of paper to protect the surface; then the middle of the opposite side is treated in the same way, after which follows the middle of one end and then of the other, the corners and the remainder of the sides being afterward dealt with. One advantage of the *dextrine* is that it can be readily softened by water, either in finally cleaning the board or in correcting any errors in applying the paper. The glue or dextrine, if rubbed down hard, will dry in a short time, and the paper will be ready for use as soon as the water has thoroughly dried out of it. One caution is necessary in removing the paper from the board, which is done by cutting around the edges just inside of the pasted margin. After the first side is cut, an adjoining and not the opposite side should be next cut, otherwise the contraction of the paper may tear the drawing badly.

In the previous chapter no mention was made of a style of drawing board called a *panel board*, which is used for the purpose of *damp-stretching*. This board is made with a rabbeted frame like a picture frame, with an interior panel fitting flush with the upper surface of the frame and fastened by buttons on the back. The sheet of paper is well damped and allowed time to expand; then it is laid over the panel, projecting an inch or so over each edge, and the panel is pressed into the frame and fastened by the buttons. As the paper is forced into the rabbet, it is drawn tight over the face of the panel, and when dry it should be smooth and free from wrinkles. This class of board is only used for small work, water-color painting, etc. In place of the process of pasting muslin and paper together on the board, as previously described, all the better qualities of drawing papers may now be had already *mounted* or backed with muslin, and in any sizes. This paper and cloth combination has a good body and is excellent to draw on, while practically indestructible; it is, however, more than twice as costly as the paper alone. It is used for important and complicated drawings which require a great deal of labor.

The great bulk of mechanical drafting—architectural, engineering or machine—is executed with the aid of the *T square*, a ruler or *straightedge* with a fixed head at one end, which slides on the edge of the drawing board and keeps the straightedge always at the same angle with the board. Thus all the lines drawn from one edge of the board will be parallel; and if, as is at least nominally the case, the adjoining edge is at right angles to the first, all the lines drawn with the head of the *T square* in contact with this latter edge will be perpendicular to those first drawn. If the board be perfectly true on all four edges and angles, which is seldom the case, the *T square* may be used from any edge. This use of the *T square* of course carries with it the assumption that the paper is fastened to the board by one of the methods described, which is usually the case. The ordinary architectural or machine drawing is composed of a large number of straight lines, parallel to one edge or the other of the board, and many of them quite short. The accuracy of the drawing depends but slightly upon these lines all being absolutely parallel or perpendicular to one another; any small errors are likely to be merely local. In a marine drawing, as we have already seen, there are comparatively few straight lines, but these few are quite long and must be absolutely straight and parallel. For the former class of drawings the *T square* is not merely useful, but indispensable; by its aid the principal lines, vertical and horizontal, may be drawn with all necessary accuracy, and the many smaller lines may be drawn very rapidly and quite accurately enough. The convenience and quickness of the *T square* in marine drawing cannot be questioned; but of its accuracy, except in drawings only 24 to 30in. long, as much cannot be said. With the most perfect appliances, a steel blade with metal head working against a metal *straightedge* fastened to the end of the board, the foundation lines of the sheer and half-breadth plans, perhaps 4 or 5ft. long, may be drawn both straight and parallel, but such perfect apparatus is not always at hand.

In the case of a design but 2 to 3ft. long, the paper may be fastened to the board, the latter being enough wider than the paper to admit of *spline weights* being used on each side, and all the lines as well as the intersections may be drawn with the *T square* with a marked saving of time. When it comes, however, to drawings 4ft. or more long, there are good reasons for laying aside entirely both the *T square* and the *thumb tacks*, and resorting to other and simpler if less rapid means.

In the first place, all drawing paper, plain or mounted, will stretch or shrink to an uncertain but often annoying degree, perhaps seriously impairing the accuracy of the drawing even before it is finished. Such shrinkage may confidently be counted on in the case of the elaborate process of *damp-stretching*, already described, as soon as the drawing is cut from the board. There is no better preventative of this annoying evil than to keep the paper, whether plain or mounted, for as long a time as possible, laid perfectly flat and with a board on it, in the atmosphere in which it will finally be used; and a supply of paper should always be on hand seasoning. A sheet of this kind, already nearly of the size required for the drawing, will change but little when taken from the pile a short time before it is needed and laid in a drawer It should by this time be in such a condition that when placed on the drawing board it will lie perfectly flat and smooth without the aid of paste or pins. If left entirely to itself, it will change much less than if confined to the board in any way.

The nature and proportions of such a drawing make it desirable that any part may be brought at will under the draftsman's hand, and while this is easily possible with a loose sheet of paper, it is not with one fastened to the board. In the latter case there must be left a margin of at least 6in. of board outside of the bottom and possibly the top of the paper, on which to place the *spline weights;* and if this is done the draftsman will frequently have to lean far over to reach the center or upper side of the drawing. With the drawing free, it may be pushed back when working on the near side, or drawn down when working at the top, on the sheer, rail, etc.; or for the same purpose it may with advantage be reversed, the upper side being temporarily turned toward the draftsman. This will almost inevitably be necessary in drawing the curves of the body plan. A revolving table such as previously described obviates the necessity for actually turning the paper around; but even with it the paper will require to be moved toward one edge or the other. Still another advantage of having the paper thus free is that, when work is finished for the time, the drawing may be laid away securely in a drawer; and if it becomes necessary to lay it aside for a time to take up other work, the drawing board is left clear for the latter. After being brought up to the conventional use of the *T square* in various classes of drawing, and following it as a matter of course for years in marine drafting, we have finally hung up all save the shorter ones in a nice quiet place on the wall, where they can rest at ease, only coming down at long intervals for some special piece of work. Of course, the smaller ones are in constant use on sail plans, details, fittings and similar work more closely allied to machine drafting. Another consideration, though a slight one, is worth mentioning: if the drawing be free, it is possible to turn it over and sketch on the back, which has almost as good a surface as the face, many useful details, thus keeping them conveniently at hand on the one sheet of paper.

The 21ft. knockabout recently illustrated in the FOREST AND STREAM is about completed at the yard of her designer and builder, W. P. Stearns, Marblehead. She will be named Verona, and will be owned by C. B. Tucker, of Boston. Mr. Stearns is now very busy with the new 16ft. fin-keels and other work.

Oil Stoves for Yachts.

NEW YORK, April 1.—*Editor Forest and Stream:* Having had considerable experience with stoves of all kinds on a yacht, I have found the one called the Oil-gas, made by a firm on Pearl street, this city, to be the best. The burners should be renewed every season to get the best results.

I understand that there will be another blue flame kerosene stove for yachts brought out during the summer, about which great claims are made, but which are yet to be proved. A stove called the Primus is good, but small, and apparently not as controllable as the Oil-gas. Neither of these have wicks. The Florence wick stoves are manufactured still to the best of my knowledge. E. T. BIRDSALL.

YACHTING NEWS NOTES

The prospect for a large fleet in the trial races of the Seawanhaka 20ft. class is improving as the beginning of the season nears. The contract for the Rouse-Hoyt fin keel has been placed by Gardner & Cox with the Spalding St. Lawrence Boat Co., and work will commence at once. The same firm has also an order from C. H. Crane for a 20-footer in addition to the boat already built by Lawley for Mr. Crane. The second boat is for a syndicate of which Mr. Crane is a member.

Scythian, steam yacht, Miss Susan De Forest Day, reached New York on March 30 after a cruise of three months in the West Indies, calling at St. Croix, Saba, St. Christopher, Basse Terre, St. Kitts, Nevis, Montserrat, Guadeloupe, San Domingo, Point a Pitre, St. Lucia and Jamaica. A good deal of heavy weather was encountered on the cruise, but it was most enjoyable; the yacht has proved herself a comfortable and seaworthy craft. It will be remembered that the yacht was originally a tramp steamer, but refitted last year when purchased by Miss Day.

Eleanor, steam yacht, W. A. Slater, has been chartered by Tams & Lemoine to Oliver H. Payne, of New York, who will sail about June 1 for British waters and the Baltic. Capt. W. C. Scott, who was formerly in command of Mr. Slater's yacht Sagamore, and who has been connected with Eleanor since the first plans were made, afterward taking her around the world, is still in command.

Yampa, schr., R. S. Palmer, has been laid up all winter at New London, where she is now fitting out for a cruise to British waters and the Baltic. On her cruise to the West Indies a year ago all of her boats were smashed in a blow in the Gulf Stream. Messrs. Tams & Lemoine have just furnished her with two new boats from special designs by W. P. Stephens, and built by the Spalding St. Lawrence Boat Co. at Ogdensburgh. The gig is 24ft. long and the cutter 20ft., the latter fitted with a centerboard and two rigs, sprit mainsail and mizzen or mainsail and jib.

Messrs. J. F. Lovejoy and H. C. Wintringham will remain on the Larchmont Y. C. regatta committee for the present season, with Mr. Howard W. Coates as the third member.

Lasca, schr., Gen. Jas. S. Watson, has reached Gibraltar.

Com. George J. Gould, A. Y. C., has reappointed Gen. T. L. Watson fleet captain and Dr. W. R. Townsend fleet surgeon for the season.

Narada, steam yacht, *nee* Semiramis, ex-Margarita I., now owned by Henry Walters, will visit England this season. She is now at New London.

Alcedo II., the new steam yacht building for George W. Childs Drexel from designs by A. S. Chesebrough, will be launched on April 10 at Harlan & Hollingsmith's yard, Wilmington.

On March 17 the two American steam yachts Varuna, Eugene Higgins, and Margarita II., A. J. Drexel, were at Venice; their next port being Messina.

Buccaneer, steam yacht, W. J. Hearst, was at Nassau on March 23.

Duquesne, steam yacht, T. R. Hostetter, arrived at New York on March 26 from a long cruise in the West Indies.

Columbia, steam yacht, J. H. Ladew, arrived at Key West from Nassau on March 25.

Lufra, ketch, has been cruising this winter in the West Indies with Sir Cecil and Lady Miles.

Nourmahal, J. J. Astor, arrived at St. Thomas on March 9, and sailed two days later for St. Croix.

Canoeing.

AMERICAN CANOE ASSOCIATION, 1896-97.

Commodore, John N. MacKendrick, Galt, Canada.
Sec'y-Treas., John R Blake, Galt, Canada.
Librarian, W. P. Stephens, Bayonne, N. J.

PURSERS.

Atlantic Division, H W. Fleischman, 1611 N. 21st St., Phila., Pa.
Central Division, Laurence C. Woodworth, Gouverneur, N. Y.
Eastern Division, F. J. Burrage, West Newton, Mass
Northern Division, Francis H. Macnee, Kingston, Canada.
Annual dues, $1; initiation fee, $1.

WESTERN CANOE ASSOCIATION, 1895-96.

Commodore, C. F. Pennewell, Detroit, Mich.
Vice-Commodore, Nat. H. Cook, Chicago, Ill.
Rear-Commodore, E. H. Holmes, Milwaukee, Wis.
Sec'y-Treas., W. D. Stearns, Detroit, Mich.
Executive Committee: R. M. Lamp, Madison, Wis.; C. J. Steadman, Cincinnati, O.; F. W. Dickens, Milwaukee, Wis.

The Ianthe C. C. will hold a smoker on Saturday, April 10, at 8 P. M., at the club house at Woodside, near Newark, to which all canoeists are invited. The club house may be reached by the Newark Branch of the Erie R. R. from the foot of Chambers street, New York, by the 7:30 P. M. train

British Canoe Association.

FROM correspondence from the other side of the big water we learn that the prominent sailors of the B. C. A. will make a most determined effort to win back the Challenge cup which was won by W. W. Howard, of the New York C. C. The races will be sailed during the latter part of June.

The B. C. A. annual meet will be held July 10 to 31, and they will try the experiment of a genuine cruising meet from Athlone down the Shannon through Lough Dey to Killaloe, with seven different camping sites *en route*.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the FOREST AND STREAM.

Rifle Range and Gallery.

Columbia Pistol and Rifle Club.

SAN FRANCISCO, Cal., March 14.—There was a lot of rifle and pistol work at Shell Mound ranges to-day. The light was good during the greater part of the day, and the wind was fair. Good scores were made.

A. H. Pape broke the 3-shot rifle record in the Bushnell medal match. He made 1, 1, 4—6 in three consecutive shots. This means that two bullets struck the inch center and the third was only 2in. from the center, or an average of 3 shots in a 2in circle, off-hand, 200yds. In this match Pape yesterday lowered his record by 6 points, his best 30-shot scores averaging 90 points on 3in. bullseye hits.

The class medal scores and best scores on the re-entry matches, Columbia target, were as follows:

Rifle, 200yds., class medals, for members only:
Champion class: A. H. Pape 65, F. O. Young 71, F. E. Mason 96
First class: O A. Bremer 75, A. B. Dorrell 77, E. Jacobson 81, C. M. Daiss 86, G. Schultz 101, A. Gehret 102.
Second class: J. E. Gorman 71, M. J. White 121, G. Barley 139.
Third class: G. Mennel 139, C. Hinterman 139, V. J. Lamotte 142, Mrs. M. J. White 175, Mrs. L. J. Crane 182.

Pistol, 50yds., 10-shot scores:
Champion class: C. M. Daiss 43, Dr. L. O. Rodgers 47, F. O. Young 54, J. E. Gorman 55.
First class: F. E. Mason 46, M. J. White 67, E. Jacobson 77.
Second class: G. M. Bailey 50.
Third class: C. Roberts 72, H. J. Wicker 77, R. W. Forrest 96, Mrs. M J White 96, Dr. J. J. Giusti 106, Mr. L. J. Crane 133, A. Hinterman 151, Mrs. C. F. Waltham 174, V. J. Lamotte 213.

Rifle, all-comers, re-entry matches, F. H. Bushnell medal, 3-shot scores: H. H. Pape 6, 10, 11; F. O. Young 12, 12.

William Glindeman military medal, 10 shots, Creedmoor count: E. Hovey 48, 46, 45; F. O. Young 46, J. E. Gorman 45, E. Jacobson 44, C. F. Waltham 42.

F. O. Young rifle-record medal, 10-shot scores: F. O. Young 56, J. E. Gorman 65, F. E. Mason 71, Dr. Bangs 76, Dr. Barker 80.

Achille Roos .22cal. medal, 50yds., 5-shot scores: E. Jacobson 8, 9, 10, 11, 11; H. J. Wicker 15; Mrs. L. J. Crane 11, 12, 14; Mrs. C. F. Waltham 20, 22; Mrs. M. J. White 28, 32.

Pistol, 50yds., Gordon Blanding medal, 3-shot scores: F. O. Young 7, 10, 11, 13; C. M. Daiss 9, 9, 11, 11; S. Carr 18, 14.

Howard Carr—Any revolver, medal, 6 shot scores: C. Roberts 36, 38, 47, 47.

Diamond pistol, medal, 10-shot scores: C M. Daiss 33, 40, 42, 44; F. O. Young 54, 57, 60; Ed Hovey 54, 57; S. Carr 49; A. B. Dorrell 51.

The Madison Square Tournament.

THE Tournament Committee having in charge the management of the recent tournament in Madison Square Garden, during the week of the Sportsmen's Exposition, has wound up its affairs and gone into retirement with honor.

The committee met on Thursday last, April 1, in Room 1,009, 377 Broadway, the quarters of the Sportsmen's Association, and presented a statement of its receipts and disbursements for the purpose of having the same audited and approved by the secretary treasurer of the Association, Mr. J. A. H. Dressel. The balance to the credit of the committee was a sum approximating $300. That sum will be held in trust by the Association, to be placed at the disposal of the committee for next year's tournament when such committee is appointed.

An elaborate scheme is under advisement for next year's tournament. In addition to contests similar to those held this year, team matches and contests for telescope sights, .22 long rifles, etc., will in all probability find a place on the programme. The prizes, too, will be proportionately greater, and the number of ranges more than doubled.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

FIXTURES.

April 10—WINDSOR LOCKS, Conn.—All-day tournament of the Windsor Locks Gun Club. Targets. C. F. Cleaveland, Sec'y.

April 14-16.—ATCHISON, Kan.—Airy Lou Hart's third manufacturers' amateur and fourteenth open-to-all tournament. $750 added money.

April 14-16.—BALTIMORE, Md.—Tournament of the Interstate Association, under the auspices of the Baltimore Shooting Association.

April 15.—YOUNGSTOWN, O.—First tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

April 15-17.—SAN ANTONIO, Tex.—Tournament of the San Antonio Gun Club. Open to amateurs only. Willard T. Simpson, Chairman Ex. Com.

April 16.—BRIDGEPORT, Conn.—All day shoot of the Bridgepor Gun Club. Targets. V A Blakeslee, Sec'y.

April 17.—NUTLEY, N J.—All-day shoot of the Yanticaw Gun Club. Targets from a magautrap. Shooting chmmences on arrival of 9:52 train from Chambers street, New York.

April 19.—HINGHAM, Mass.—All-day shoot of the Hingham Gun Club. 100-target handicap. G O. Henderson, Treasurer.

April 20-21.—ROCHESTER, N. Y.—Tournament of the Rochester Rod and Gun Club. Targets

April 20-23.—LINCOLN, Neb.—Twenty-first annual tournament of the Nebraska State Sportsmen's Association. $1,000 added.

April 21-23.—SAN ANTONIO, Tex.—Second annual meeting and tournament of the Texas State Sportsmen's Association. O. C. Guessaz, Sec'y.

April 27-29.—BINGHAMTON, N. Y.—Tournament of the Binghamton Gun Club. Two first days, targets; third day, live birds.

April 27-30.—FONDA, Ia.—Tournament under the management of Geo. E. Hughes and C. R. McCord. Live birds. $800 added money.

April 28-29.—RICHMOND, Va.—Tournament of the Interstate Association, under the auspices of the West End Gun Club.

April 28-29.—PERU, Ind.—Tournament under the management of J. L Head.

May 4-6.—DES MOINES, Ia.—Tournament of the Iowa State Sportsmen's Association. Live birds and targets. F. C. Whitney, Sec'y.

May 5-7.—NEWBURGH, N. Y.—Annual spring tournament of the West Newburgh Gun and Rifle Association. First two days, targets; third day, live birds. $50 average money to three high guns in all programme target events. Open to all.

May 6.—SHERBURNE, N. Y.—Annual tournament of the Sherburne Gun Club. One day at targets. L D Brainard, Sec'y-Treas

May 11-13.—PEEKSKILL, N. Y.—Annual tournament of the Peekskill Gun Club. First two days, targets; last day, live birds

May 11-14.—WATERLOO, Ia.—Tournament of the Waterloo Gun Club. E. B. Walker, Sec'y.

May 12-13.—CONNERSVILLE, Ind.—Tournament of the Connersville Gun Club. Live birds. T. F. Thomas, Sec'y

May 17-22.—KANSAS CITY, Mo.—Annual tournament of the Missouri State Game and Fish Protective Association. Fred T. Durrant, Sec'y.

May 18.—ALBANY, N. Y.—Annual spring tournament of the West End Gun Club. Horace B. Derby, Sec'y.

May 18-19.—FOREST CITY Ia.—Hill City Gun Club's second annual tournament; $100 added. J. W Mahoney, Sec'y.

May 19-20.—SAVANNAH, Ga.—Tournament of the Interstate Association under the auspices of the Forest City Gun Club.

May 19-21.—CANTON, S. D.—South Dakota Sportsmen's Association annual. C. S. Seely, Sec'y.

May 20.—GREENVILLE, Pa.—Second tournament of the Pennsylvania and Ohio Border Gun League. Geo. H Jones, Sec'y.

May 28-29.—EAST ST. LOUIS, Ill.—Annual tournament of the King's Smokeless Gun Club.

May 31.—CANAJOHARIE, N. Y.—Eastern New York Trap-Shooters League tournament, under the auspices of the Canajoharie Gun Club. Charles Weeks, Sec'y.

June 2-4.—SPRINGFIELD, O.—Annual tournament of the Ohio Trap-Shooters' League, under the auspices of the Springfield Gun Club.

June 7-8.—PARKERSBURG, W. Va.—Tournament of the Mountain State Gun Club. Targets. $350 added Leon J Epstein, Sec'y.

June 8-9.—Tournament of the Trap Shooters' League of Indiana.

June 8-11.—AUBURN, N. Y.—New York State Sportsmen's Association tournament. C. W. Tuttle, Sec'y.

June 9-10.—MONROE, La.—Tournament of the Interstate Association, under the auspices of the Monroe Gun Club.

June 10.—NEWCASTLE, Pa.—Third tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

June 15-18.—CLEVELAND, O.—Fourth annual tournament of the Chamberlin Cartridge and Target Company.

June 16-17.—FARGO, N. D.—Third annual tournament of the North Dakota Sportsmen's Association. Targets. W. W. Smith, Sec'y.

June 22-25.—OIL CITY, Pa.—Seventh annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Oil City Gun Club. Targets and live birds. Black powder barred. Special event: 25 live birds per man, $25, $1,000 guaranteed. Send entries to H C. Reeser, Sec'y, Oil City, Pa.

July 14-15.—NEW HAVEN, Conn.—Tournament of the Interstate Association, under the auspices of the New Haven Gun Club. Wm. H. Hazel, Sec'y.

July 22.—MEADVILLE, Pa.—Fourth tournament of the Pennsylvania and Ohio Border Gun League. Geo. H. Jones, Sec'y.

Aug. 4-5.—LEWISTON, Me.—Tournament of the Interstate Association, under the auspices of the Androscoggin Gun Club.

Aug 17-19.—TORONTO, Canada.—Tournament of the R. A. McCready Co., Ltd. Targets. $1,000 guaranteed. Open to all. Write for programmes.

Aug. 19.—WARREN, O.—Fifth tournament of the Pennsylvania and Ohio Border Gun League. Geo. H Jones, Sec'y

Aug. 25-26.—MONTPELIER, Vt.—Tournament of the Interstate Association, under the auspices of the Montpelier Gun Club.

Sept. 15-16.—PORTSMOUTH, N. H.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club.

Oct. 6-8.—NEWBURGH, N. Y.—Annual fall tournament of the West Newburgh Gun and Rifle Association. First two days, targets; third day, live birds. $50 average money to three high guns in all programme target events. Open to all.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The board of governors of the California Inanimate Target Association held its annual meeting on Saturday, evening, March 20. The meeting was held at the Olympic Gun Club rooms. The president of the Association, Mr. M. C. Allen, occupied the chair. The president, in presenting his annual report, recommended that some system of division of purses, whereby all ties divided, should be adopted at the next tournament. He suggested the adoption of the Rose system or some similar plan. An informal discussion on this point showed that the consensus of opinion on the part of those present was in favor of "all ties divided." The treasurer's report showed a handsome balance in hand to the credit of the Association. The Encinal Gun Club, of Alameda, was elected a member of the Association. The election of officers resulted as follows: President, M. C. Allen, Olympic Gun Club; Vice-Presidents: F. B. Norton, Reliance Gun Club; T. R. Barney, Alameda County Sportsmen's Club; C. Carr, Monterey Gun Club; Chas. Van Valkenbury, Los Angeles City Gun Club, and C. J. Haas, Stockton Athletic Association Gun Club; Secretary Treasurer, L. P. Bolander, Golden Gate Gun Club. A pleasing feature of the occasion was the presentation by Mr. Frank Norton, on behalf of the members of the Association and of the sportsmen of California, of a gold watch and fob to the president, Mr. M. C. Allen. The members present at the meeting were: Lincoln Gun Club, R. G. Wenzel and D. Daniels; Reliance Gun Club, Wm. Marshall, Col. S. I. Kellogg and F. B. Norton; Empire Gun Club, F. W. King and F. L. Judd; Olympic Gun Club, H. H. White, M. C. Allen and T. R. Barney; Alameda County Sportsmen's Club, Geo. E. Perkins and T. R. Barney; Encinal Gun Club, J. H. Walker, H. A. Hoyt and H. Betten; Golden Gate Gun Club, T. Lewis, C. M. Wollam and L. P. Bolander.

While in Hartley & Graham's store, 313 Broadway, on Saturday morning last, we had the pleasure of meeting Mr. R. P. Cory, of 1208 South Broadway, St. Louis, Mo. We very nearly shook hands with Mr. Cory without the ceremony of an introduction, for he is an exact double of a very prominent member of the New York State Sportsmen's Association who resides in Rochester, N. Y., viz.: Mr. Richmond, a gentleman who never misses the State shoot or its annual meeting. Mr. Cory, however, made amends for not being Mr. Richmond by showing us an invention for doing away with the necessity of two sets of barrels, field and trap. This invention has been patented about a year, and Mr. Cory is now devoting his time to putting it on the market, so we are not disclosing any secret by giving a description of it. Mr. Cory handed us a neat little gun with 27 or 28in. barrels, and explained that it was a pure cylinder, and naturally an excellent quail or brush gun. He then pulled out of his pocket about 2in. more of the same gun barrels with a perfectly simple attachment underneath that practically made the gun 30in. and full choke at that. "There you have a duck or trap gun," said Mr. Cory. And it was a fact. He further explained that over 5,000 trial shots had been fired through the (what we may call) "spliced gun," for the purpose of fully testing its capacity for wear and tear. He also told us that with the cylinder 28in. barrels he got a nice even pattern at regulation brush distance, and increased that pattern more than 33 per cent. when the "splice" was made. Although the idea is not exactly new, the method of attachment *is* and it is the most simple, effective and practical one we have ever seen. Why shouldn't it be just the thing for a man who wants to shoot both quail and ducks with the same gun?

In a letter to us, advising that a programme of his tournament had been mailed us, Lou Erhardt says: "You will note a change in the programme. We will all shoot the Sergeant system, which is no experiment. We tried it, and it is simply perfect. Any club can use it without any extra cost. Any kind of target can be used. Our grounds this year are also perfect as to background. To protect amateurs we have five equal moneys, with $25 added to every purse, and $50 per day to the five high guns." The Sergeant system referred to is the idea of W. G. Sergeant, of Joplin, Mo., and may be described as follows: Shooters' platform is 12yds. long, making 3yds. between each of the five shooters at the score. Three traps are placed directly in front of No. 3 score, 16yds. from that score, and each trap only 30in. apart, or 5ft. between the two outside traps. By this means, that is, by having the traps so close together, it is claimed that no loss of time is the result of a target breaking in the trap. If a target breaks, the shooter calls "Pull!" again, and the next trap is pulled. All traps are pulled in rotation, and the traps are so close together that it is practically known trap, unknown angles, all the time.

One of the funniest things in the way of reporting a shoot that we have seen lately occurred in a Rochester (N. Y.) daily quite recently. The article, which treats of a shoot held by the Rochester Rod and Gun Club, is headed "A New Trap for Throwing Squabs." As a matter of fact, the Rochester boys have just leased a magautrap, and this is how the local reporter described Paul North's new machine and its workings: "The magautrap is new in this section of the country; yesterday's trial was the first it had had in this section of the State. One boy can run it. He rides astride a saddle and works bicycle pedals which revolve a sprocket, which runs a chain connecting with an arm. The arm revolves in a line parallel to the earth, or it can be elevated a little so as to send the birds in the air. The feeder holds as many squabs as one cares to put in it, and as the pile lowers it is only necessary to place others on top of those already in. One magautrap will send birds flying all day without stopping. Each is released by the action of electricity, and as fast as one can push a button a bird is released."

The following notice has been sent out to members of the Boston Gun Club; "Out of respect to the late Mr David Kirkwood, the Boston Gun Club '97 prizes will be postponed two weeks; the remaining six shoots taking place April 14 to May 19 inclusive, instead of March 31 to May 5." The following obituary notice is taken from a Boston paper: "David Kirkwood, of Malden, who was so well known throughout New England as a gunmaker, with an office in Boston, died this morning at his home, No. 87 Waite street, in that city, after a lingering illness. He was born in Edinburgh, Scotland, fifty-six years ago, where he was apprenticed to the well known gunsmith Mortimer. After serving some years he went to Germany and worked at the trade, finally settling down for a time in London. Mr. Kirkwood came to this country in 1872, and soon after started in business with Henry Mortimer, a son of the man with whom he served his apprenticeship. After a few years the partnership was dissolved, and Mr. Kirkwood carried on the business up to the time of his death. He served forty-six continuous years at the bench. His place of business in this city was on Elm street."

E. C. Burkhardt, of Buffalo, was one of the 24s in the recent Grand American Handicap. E. C. had a little ill luck too, as his lost bird fell dead out of bounds. We don't know anybody who has worked harder in past years for honors in the Grand American than Burkhardt; it was therefore with much pleasure that we handed him his order on the casbier for $188.45, the fruits of his 24 out of 25. And by the way, Mr. Burkhardt did not return kind for kind, as he caused us no end of trouble by losing his 15th bird in the Consolation Handicap on the last day. Had he scored that bird he'd have saved us all the worry and bother of shooting up the raft of 13s who fell in for a share of the $14.40, the tenth money in that event. His remissness in this respect caused the cancellation of all entries for the closing event, the Long Branch Scramble, and robbed Elmer Shaner of the glory of finishing the programme.

Immediately following Lou Erhardt's shoot at Atchison, Kansas, comes the 21st annual tournament of the Nebraska State Sportsmen's Association, to be held April 20-23 at Lincoln Park, Lincoln. Empire traps, pulls and targets will be used, and all events will be at known traps, unknown angles. One thousand dollars will be added to the purses, and the tournament will be thrown wide "open to the world." Programmes for the shoot are ready for distribution. Write for one to the managers, George Rogers, H. H. Harley, or R. M. Welch.

Col. A. G. Courtney, of the Lefever Arms Co., was present at the Grand American Handicap, and was kept quite busy shaking hands. Court has a vast acquaintance among shooting men, and is deservedly popular with them. One of his chief recommendations is his talent as a *raconteur*, talent that may be equaled, but never surpassed. He has a record of never having been at a loss for a story to beat the one just previously told. He relates tales of hairbreadth escapes while hunting with the nonchalance that bespeaks the true hero. Court and his gun, a Lefever, of course, are consequently always welcome at any shoot, and no State shoot in New York is ever complete without his presence. We shall see him at Auburn next June.

We gladly give space to the disclaimer (given elsewhere) from Mr. A W. Wells, one of the most prominent members of the Worcester (Mass.) Sportsmen's Club, that he was not the author of the article signed Paradise Lost, which was dated from Worcester and recently published by one of our contemporaries. At the time that we reprinted that letter—and treated it rather more courteously than it deserved—we stated, in fact, that Mr. Walls could not be the author of such a tangle of misstatements. We are, nevertheless, glad to hear from Mr. Walls, and now repeat the old question: "Who is Paradise Lost?"

Dick Merrill and Chan Powers did not return West with the other members of the Western team. They stopped off a week and looked around New York. We met Mr. Merrill on Friday last and he expressed himself as delighted with his trip, and as particularly pleased with the manner in which the Grand American Handicap had been handled by Manager Sharer. His sentiments coincided exactly with those of all who spoke to us on this subject. It was a great shoot and superbly managed.

The next big shoot in this vicinity will be the Baltimore Interstate, April 14-16. We have already given full particulars of the programme, so that we have nothing more to add save to state that, from the present outlook, the Interstate's opening target shoot for 1897 is going to be a bumper. It is as well to remember too that on the live-bird day, April 16, all events are high guns, a programme that is bound to be popular. The grounds will be open for practice on Tuesday afternoon, April 13.

The Cazenovia, N. Y., Gun Club is an organization that moves with the times. Last Tuesday, March 30, it held an all-day shoot, and threw targets at 1 cent each. We have often maintained that targets can be thrown at 1 cent each and a profit made on the outlay, and we guarantee that the Cazenovia Club did not lose any money on its venture. The club has also leased a magautrap, and the above shoot was in honor of its inauguration.

On Thursday, April 8, Charlie Zwirlein will have a live-bird shoot at his grounds, Yardville, N. J. The conditions of the main event will be 20 live birds, $15 entrance, birds included, handicaps 28 to 32yds. The train for shooters to take is the 9:10 from New York, leaving Newark, N J., at 9:36 A. M

The three-men team race at the Boiling Springs's grounds on Saturday next, April 10, promises to be a decidedly interesting affair, as several clubs have signified their intentions of being represented on that date. The conditions are three men to a team, 50 targets per man, unknown angles, $10 per team.

Saturday, April 17, is the date set by the Yanticaw Gun Club, of Nutley, N. J, for the inauguration of the new addition to its apparatus, a magautrap. The club through its captain, Dr. De Wolfe, issues a cordial invitation to all trap-shooters to attend.

Ferd Van Dyke won the club cup shoot at the Boiling Springs Gun Club, Rutherford, N. J., on Saturday last, April 3, by breaking 49 out of 50. Neaf Apgar, Jack Fanning and J. L. Brewer, who were also among the contestants, scored 46 each.

Annie Oakley enters upon her engagement with Buffalo Bill's Wild West Show on Monday, April 12. The show opens at Ambrose Park, Brooklyn, on that date, and will remain there two weeks. Miss Oakley's friends will thus have an opportunity of seeing her once more exhibit her great skill with shotgun and rifle.

The Oil City, Pa., Gun Club has elected the following list of officers for 1897-8: President—L. L. Graham; Vice-President—A. Smedley; Secretary—H. C. Reeser; Treasurer—H. C. Dorworth; Directors—F. S. Bates, C. H. Lay, Jr., and C. T McClintock.

Mr. George Rogers, of Lincoln, Neb., writes us under date of March 27: "Please make a note of the fact that the Nebraska State Sportsmen's Association adds $1,000 to the purses at its tournament, April 20-23."

The Mountain State Gun Club, of Parkersburg, W. Va, announces that it will hold a tournament at targets, June 7-8, with $350 added money. The secretary of the club is Leon J. Epstein.

On and after July 1 Von Lengerke & Detmold will be found at 318 Broadway, the ground floor of the same building in which FOREST AND STREAM made its home for some years.

We have received no notice as yet from Mr. John L. Winston as to date and place for the match between himself and Charlie Budd for the Du Pont championship trophy.

APRIL 6. EDWARD BANKS.

Programme for the Richmond Tournament.

ADVANCE copies of the programme for the Interstate Association's tournament at Richmond, Va, April 28-29, have been furnished us by Mr. Elmer E. Shaner, the Association's manager. The programme commences with a short review of Richmond, its location, advantages, society, climate, etc, all good and interesting reading—for Richmond has about her an air of romance that loses nothing as years roll by. Shooters who visit the city of Richmond for this tournament will see something besides targets and traps, as the location of Richmond is picturesque in the extreme.

The West End Gun Club, the local club under whose auspices the Interstate Association will give this tournament, has decided to make the programme attractive to outside shooters; it has therefore determined to add $100 a day in cash to the purses. The schedule of events for each day is precisely the same, viz., ten 15 target events, $1.50 entrance, $10 added to each purse, known traps and unknown angles The Rose system of dividing purses will be used, all purses being divided into four moneys. Bluerock targets will be thrown. Shooting commences at 9 sharp each morning.

The tournament will be held at Blandon Park, two lines of electric cars connecting with a line of stages that will carry shooters to the grounds. Murphy's Hotel, Eighth and Broad streets, will be headquarters for shooters during the tournament, a satisfactory rate having been secured. The hotel is on the European plan. It has a great advantage in the fact that street cars to the shooting grounds run past the hotel.

Guns and ammunition sent in care of T. W. Tignor's Sons, 1322 E. Main street, will be delivered at the grounds free of charge. Any further information that may be desired can be obtained by addressing the secretary of the club, Edwin L. Hewitt, 803 Main street, Richmond, Va.

Buckeye Gun Club.

DAYTON, O., April 3.—I inclose a clipping from a local paper giving an account of our opening shoot:

"The Buckeye Gun Club held its first shoot of the season for certificates yesterday on the club grounds, and it was a red-letter day for all the members present, as the scores will show. The champion clay bird shot of the world, Rolla Heikes, put up the best score he has ever made on the home grounds, and the boys all put up a good score, and the club that goes up against it will think they have been to a shooting match if they beat it The happiest man in the club to-day is Dr. Adams, as he made the best score he ever made, but the boys say it was not him, but the gun he was shooting. He shot Heikes's old Monegrame gun, the one that he has shot over 150,000 shots out of. Rolla just told the doctor to hold the gun toward the traps and the gun would do the rest Among the visitors was William Lyman, an old-time Dayton shooter. The club has adopted a new rule of shooting for certificates this year. Heretofore one could be won on 20 birds, but now you must shoot at 100, and you must make a certain per cent. given you by the handicap committee, and it met with the hearty approval of all present yesterday. The club is expecting to shoot a team race with the Limited Gun Club, of Indianapolis, in the near future."

"Officers of the club for the year are as follows: President, C. W. Raymond; Vice-President, W. Scott McDonald; Secretary, John Curphy; Treasurer, C. D. Kiefaber; Executive Committee: Hi Protsman, Al. Wroe, Dr. L C. Adams; Handicap Committee: Dr. L. C. Adams, C. D. Kiefaber, W. Scott McDonald.

"The following are the scores made in the above shoot out of 100 targets for certificates: James Achey 65, Charles Miller 82, Michael Schwind 79, Andy Mumma 83, Shorty Bacon 91, Ed. Rike 96, R. O Heikes 97, Al. Wroe 80, Hi Protsman 82, C. D. Kiefaber 60, Dr. L. C. Adams 68." BUCKEYE No. 2.

Who is Paradise Lost?

WORCESTER, Mass., March 31.—*Editor Forest and Stream:* Will you kindly inform the trap-shooters through the medium of your valuable paper that I was not the author of the article recently published in one of the sporting papers and signed Paradise Lost.

Oh, no, gentlemen, when I write such an article as that I shall want the whole world to know how very *smart* I am, and shall sign myself

A. W. WALLS.

Pigeon Shooting in Paris.

THE Circle des Patineurs, the crack gun club of Paris, France, which has beautiful grounds, known as Les Acacias, in the Bois, has gotten up a most interesting programme of events for the benefit of its members and guests during the spring months. Many prominent Americans are among the members of this club, and a partial list may be given as follows: Messrs. Walter Watrous, Lewis M. Rutherford, George de Forest Grant, George Work, Walker Breese Smith, Clarence Mackay, Peter H. Morris, Fred Hoey, T. B. Burnham, Charles Macalester, Ray Miller and Wm. Rogers.

Probably some of the above may be in Paris during the two months or so covered by the programme, and if so it is likely that we shall hear of the United States figuring somewhere near the top in one or more of the events in the following programme:

The season will open on Saturday, April 3, with the Prix Bournet, for a piece of silver offered by the club, added to a sweep of 5 louis ($20), handicap rise, miss-and-out.

Saturday, April 10—Prix du Printemps, for piece of silver and $20 sweep, at 25 meters, miss-and-out.

Tuesday, April 13—Prix des Feuilles, for piece of silver and $20 sweep, handicap rise, miss-and-out.

Saturday, April 24—Prix des Lilas, for piece of silver, $20 sweep, handicap rise, miss-and out.

Tuesday, April 27—Prix de la Pelouse, for silver, $20 sweep, 26 meters rise, miss-and-out.

Saturday, May 1—Prix de Bagatelle, for silver, $20 sweep, handicap rise, miss-and-out.

Tuesday, May 4—Prix Vansittart, for silver, $20 sweep, handicap rise, miss-and-out.

Saturday, May 8—Prix Latour-Maubourg, for silver, $20 sweep, 27 meters rise, miss-and-out.

Tuesday, May 11—Prix Chateaubriand, for silver, $20 sweep, handicap rise. miss-and-out.

From May 11 to May 18 the International tournament will be held.

Tuesday, May 18—Prix de Neuilly, for silver, $20 sweep, handicap rise, miss-and-out.

Wednesday, May 19.—Prix de Madrid, for silver, $20 sweep, handicap rise, miss-and-out.

Saturday, May 22.—Grand Prix de Paris, for silver, $70 sweep, at 7 birds, 28 meters rise.

Tuesday, May 25.—Grand handicap for silver, $70 sweep, miss-and-out.

Friday, May 28.—Prix de Longchamp, for silver and $20 sweep, 2 pigeons at 27 meters and 2 at 28 meters.

Saturday, May 29.—Prix d'Auteuil, for silver, $70 sweep, handicap rise, miss-and out.

Monday, May 31.—Prix de St. James, for silver and $20 sweep, 7 pigeons at 28 meters.

Tuesday and Wednesday, June 1 and 2, for the championship and a gun offered by the club, with a $20 sweep. Thirty pigeons at 28 meters. Only those who have shot in some one of the previous sweeps are eligible for the championship.

Wednesday, June 16.—Prix de Consolation, for silver and sweep of $20, handicap rise, miss and out. Winners of previous sweeps are excluded from this one.

At the Larchmont Traps.

LADEW DEFEATS KNOWLTON.

NEW YORK, March 31.—Dr. J. G. Knowlton and E. R. Ladew, both residents of this city, shot a match to-day on the grounds of the Larchmont Yacht Club, Ladew winning after a close and exciting match, in which the winner had an uphill fight from the start until almost the last bird had been shot at. The conditions were 100 birds per man, Knowlton at 30yds. and Ladew at 28yds, 30yds. boundary.

Ladew started badly, losing 7 out of his first 25 birds, while Knowlton lost but 3 out of the same number. In the second 25 Ladew gained 1 bird by scoring 22 to Knowlton's 21. In the third string of 25 Ladew evened matters up by scoring 23 to Knowlton's 20, the scores being a tie at the end of the 75th round. Ladew then lost his 78th, but Knowlton again tied the score by losing his 80th. In the 84th round Ladew killed, but Knowlton's bird fell dead out of bounds. The latter also lost his 86 h, thus being 2 behind. Ladew, who was shooting strongly, ran straight until he lost his 92d bird dead out of bounds, the totals being thus only 1 bird apart, with 8 birds more to shoot at. Knowlton was then unlucky enough to lose his 95th dead out of bounds, and followed this up by also losing his 99th; as Ladew killed straight to the end, this gave him the victory by 3 birds after a most meritorious uphill struggle. The scores were:

E R Ladew	2212010120210222•0102121—18	
	221022•2212221122202122211—22

GUTHRIE WINS THE CUP.

April 3.—An interesting day's sport was had to day on the Larchmont grounds. There were nine entries in the main event, a 25-bird race, among the entries being Chauncey Powers, of Decatur, Ill., and C. S Guthrie, of Pittsburg, Pa. The latter tied with Dr. Knowlton for the cup on 23 out of 25, and then won the cup on the shoot-off. The shoot off was rather a peculiar affair: Guthrie lost his first bird, Knowlton following suit with a "dead out of bounds." Then Guthrie killed his second bird, but Knowlton's bird again carried the shot out of bounds.

The scores in this event are given below:

H B G lbert (29)	2122202222222222•2220221222—21	
C S Guthrie (29)	222•12222112210221111212—23	
Al Marshall (28)	C02•221000	— 5
Chauncey Powers (30)	2•2202•222221•2222222•222—21	
Dr J G Knowlton (29)	2222222 2 22202222220222221—23	
E R Ladew (29)	12222•222 0022211(22222.•—21	
Fred G Moore (29)	222C••02222 2•2250	—18
Benj Horton (28)	22•010•1111•0!2•0	— 9
D A Bradley (28)	2•2022222•2•2022222222•2•—22	

Other events shot were two 5-bird sweeps and two 10-bird sweeps In the first 5-bird event Guthrie took first money with 5 straight from the 29yds. mark. In No. 2 D. Bradley (28) was high with 5. In the first 10-bird event Guthrie (29) and E. G. Moore (29) divided with 10 straight. In the last event, also at 10 birds, H. B. Gilbert (29) and C. Powers (30) were tied at the end of the 10th round. Instead of dividing, they shot off, miss-and out, Powers killing 14 more, Gilbert losing his 14th bird in the ties. Scores in these four events follow:

Events:	1	2	3	4	Events:	1	2	3	4

RAYELRIGG.

Marlin Gun Club.

MARLIN, Texas, April 2.—The following scores were made to-day by members of the Marlin Gun Club:

	No. 1.	No. 2.	No. 3.
W W Turner	0110011110—6	1001110001—5	11010—3
C J Bartlett	0011101100—5	0010001001—3	.....
R B Louis	0001001010—3	0111001000—4	10010—2
C A Oltorf	1111111001—8	0100100010—3	10111—4
J G Oltorf	0111000000 3	1011010010—5	11001—3
J R Emery	.....	1000100111—5	00011—1

The above events were all at bluerocks, known traps and angles.

This club will hold a shoot of some importance in the near future; the principal event will be a handicap for a souvenir keg of W-A powder, donated to the club by the Laflin & Rand Powder Co.

E. R. EMERY, Pres.

The Atchison Tournament.

THE Atchison tournament will be managed, as usual, by Jack Parker, Lou Erhardt acting in conjunction with Jack to see that all the shooters get what shooting they want. As already announced, the programme consists each day of eight 20-target events, $2 entrance, $25 added to each purse, five equal moneys, all ties divided—a simple programme, and one easily carried in the head. It will also be an easy one to handle, and under the management of Jack Parker everything is bound to run smoothly. In addition to the above events, an open set of traps will be kept busy with events to suit those present.

Among the "rules and regulations" are the following notes:

Latest revised A. S. A. rules (rapid-fire) to govern. The referee's decision is final under all circumstances. We mean what we say. We are going to have a dead square shoot. Programme events, with added money, will be five equal moneys, divided 20, 20, 20, 20, 20 per cent. No dropping for place will be tolerated. We have added $50 a day for averages- five high guns Amateurs must be protected. Shooting to commence promptly at 8:30 A. M. Contestants requested to make entry for the entire programme for each day. Money refunded for all uncontested events. Electric street cars run to the grounds every fifteen minutes. We have new grounds at ball park, with perfect background.

Byram Hotel will be headquarters. Accommodations secured in advance for those desiring it. Shooters wishing to send shells, guns, etc., in advance can address same to Louis Erhardt & Co.

Three sets of traps will be used W. G. Sergeant system. Except if more satisfactory, will stand in semi-circle. If shot in squads of six men, regular walk around. If in squads of five men and 20 targets, shoot in rotation from one to five, and each one shall shoot at 4 targets and then all move up one position. In this way each contestant shall shoot at an equal number of targets from each of the different positions. Traps are pulled in rotation. Should target break in trap contestant immediately calls "Pull!" again, when next trap in rotation will be sprung. These three traps are so close together contestant can notice no difference, and it is equal and fair to all. This is no experiment. It was used at the Leavenworth tournament, March 17, and one and all of twenty five participants were more than pleased with it, and pronounced it the only system.

1895 record—Highest entry, 94. 1896 record—Highest entry, 108. Lou. Erhardt's celebrated hand loaded shells of all kinds will be for sale on the grounds at reasonable prices.

Traps will be open for practice and sweepstakes, Tuesday, April 13. Address all letters to Lou. Erhardt, Secretary, Atchison, Kan.

A Ladies' Gun Club.

WE clip the following from the *Breeder and Sportsman* of California, of March 27, feeling that it will interest many of our readers:

"The latest fad in southern California is a ladies' gun club. The members of the club are: Mrs. Leslie C. Brand, President; Mrs. M. L. Wicks, Secretary and Treasurer; Mrs. Charles Haskins, Mrs. D. S. Wildemuth, Mrs. Spencer Millard, Mrs. Chas. Luckenbach, Mrs. Mayor Snyder, Mrs. Chas. Sessions, Mrs. Hervy L. Pinney, Miss Pinney, Mrs. Gude, Mrs. Daniel Innes, Miss Innes, Mrs. Arthur Morlan and Mrs. Howard Starker.

"The dues are devoted to the purchase of prizes and ammunition. The clubwomen meet every Saturday at 3 P. M. at Mrs. Brand's, where they practice, many of them being quite skillful markswomen.

"The scene is always animated, for each lady owns a dog, and a dog which loves a gun. Mrs. Brand has four dogs—a pointer and three setters. Mrs. Wicks has a water spaniel, Mrs. Haskins has a spitz, Mrs. Millard a setter, and the others dogs of various breeds. Indeed, it is one of the rules of the club that each member must own at least one dog.

"The recent tramps have shown the ladies the folly of conventional gowns in gun clubs, and a pretty costume is now being evolved, which consists of a skirt of Lincoln green, a tan blouse and leather belt, bloomers, high laced leggins, and a little tan cap with a green visor.

"Of course the score is kept, and each month a prize is awarded. Mrs. M. L. Wicks proved the most efficient markswoman last month, and fell heir to a beautiful fern, an immense maiden hair, in a handsome jardiniere, of which she is justly proud.

"Each lady entertains the club in turn one day in the week, when a few guests are invited. At these social afternoons, which are purely informal, the refreshment is simple, the conversation is confined to sporting subjects, guns are overhauled, the prizes decided upon, and many other important things receive due attention."

Sandusky Gun Club.

SANDUSKY, O, March 17.—Below are the results of the Sandusky Gun Club's tournament, which closed to-day. The regular order of the programme was not followed out, as most of the shooters came straggling out to the grounds about 10 A. M, causing considerable delay; consequently the target events were dropped, and the remainder of the day devoted to live-bird events. The second day's shoot was devoted exclusively to live-bird shooting.

Visitors from other clubs were C. G. Bodifield, G. E. Worthington, and Mr. Elliott, Cleveland, O; and Mr. Wells, of the Norwalk (O.) Gun Club.

All of the boys are amateurs at live-bird shooting, and from the results of their scores, with a little practice, would develop into very good wing shots:

Events:	1	2	3	4	5	6	7	Events:	1	2	3	4	5	6	7

Audubon Gun Club, of Buffalo.

BUFFALO, N. Y., March 27.—The list of shooters at to-day's shoot of the Audubon Gun Club was a long one, as usual. There were twenty-five entries in event No. 3, the weekly badge contest. In this event F. D. Kelsey won the Class A badge with 24; E. Reinecke the Class B badge with 20, and D. C. Sweet the Class C badge with 16. No. 4 was the monthly cup shoot, and in this event E. W. Smith was the winner with 26. No. 7 was at 10 targets, expert rules. Scores:

Tournament at Sistersville.

SISTERSVILLE, W. Va., March 19.—Sistersville, W. Va., is a typical "Oil City;" business is on a boom and the city is the possessor of numerous attractions not easily found elsewhere. The gun club is composed of gentlemen of high standing and influence, having the necessary means to do anything to which they make take a notion.

Trap-shooting in this State is decidedly on the increase, and is augmented by the friendly rivalry which exists between the Parkersburg, Sistersville and Marietta gun clubs for supremacy. On Washington's Birthday the Parkersburg club gave a one day shoot and now Sistersville has just finished a two days' tournament, during which $150 was added to the programme events. Parkersburg is not to be outdone, so they are now working hard to secure at least $500, which they will add to their shoot, which comes off early in June.

During the first day of the Sistersville tournament a friendly match was shot between a picked team of six men from Parkersburg and a like number from Sistersville. This resulted in a victory for Sistersville by a score of 119 to 108.

A writer on one of the local papers was so highly elated over the victory that he took occasion to deride the visiting team and add just a tinge too much to his roasts regarding the shooting qualities of the visitors. There is no question but what it was intended as a good joke, and no harm was meant in any sense of the word; but at the same time the matter should have been handled more skillfully.

The grounds of the Sistersville Rod and Gun Club are situated on a very high eminence halfway up a steep hill which lies west of the city. The plateau is reached by ascending a long flight of steps, which invariably caused a goneness to overcome those who were brave enough to attempt to ascend them. The club house, board walks, screens and other accommodations are faultless and strictly up to date in every respect. The shooters face directly east, the background being composed of the remaining half of the hill (or mountain) referred to. To the right it slopes down and in all directions can be seen the tall oil derricks and power houses. It is a busy scene, and by turning around to the west one witnesses a picture which can never be forgotten. Far below lie hundreds of oil wells, forming a continuous line as far as the eye can see, and even then only a very slight conception of this vast industry can be formed. Among the visitors from out of town were R. S. Waddell and R. L. Trimble, of Cincinnati, representing the Du Pont and Hazard Smokeless powder; J. H. Mackie, also of Cincinnati, representing the Peters Cartridge and King Powder companies; H. E. Norton, of Ironton, O., who so ably looked after the interests of the Winchester Repeating Arms Co.; F. D. Alkire, of Woodlyn, O.; J. E. Wright, Wheeling; J. G. Gall, Martin's Ferry, O.; O. E. Verges, Lowell; P. S. Schlicher and Geo. Aiford, Marietta; F. E. Mallory, L. Stephens, J. E. Mallory, L. J. Epstein, S. T. Mallory and Robt. Clarke, of Parkersburg; D. A. McGillis, St. Mary's; T. S. Bibbee, Elba, O.; and A. H. Donnolly, of Fairmount. Mr. Mackie was doing good work for King's Smokeless, and made many friends. R. L. Trimble won first average, J. F. Mallory second, and F. D. Alkire third. Of the 25 contestants participating, over 20 used Du Pont Smokeless loaded in the Leader case. Following are the scores in full:

First Day, March 17.

LESTER.

Pawtuxet Gun Club.

PAWTUXET, R. I., March 17.—The Pawtuxet Gun Club held a prize shoot to-day, the conditions being 25 targets, handicap allowance of extra targets to shoot at. The prizes were six cans of Du Pont Smokeless, donated by the Du Pont Powder Company, and 100 shells loaded with Du Pont Smokeless, donated by R. C. Root, of the C. F. Pope Company, of Providence. Mr. Cory shot in this race as a guest of the club. First prize was won by Arnold, who broke 17 out of his 25 and then broke all his allowance, making his total 21. Scores were:

Arnold (4).....0011111101101100010111111111111 —21

Trap Around Pittsburg.

HAZELWOOD GUN CLUB'S OPENING.

PITTSBURG, Pa., March 27.—The Hazelwood Gun Club held the first shoot to-day on its new grounds. The question as to who should have the honor of firing at the first bird trapped on these grounds was decided by lot; Crossland won the toss-up and killed his bird with the first barrel. This pigeon will be mounted by Vice-President Messner, and will adorn the main room of the new club house. Scores in the sweepstake events are given below:

	No. 1.	No. 2.	No. 3.

UPSON WON ONE AND LOST ONE.

March 29.—D. A. Upson, of Cleveland, and Theodore Hostetter, of this city, shot a race to-day on the grounds of the Herron Hill Gun Club, the conditions being 100 live birds per man, $250 a side. Upson won easily with 93 to 74, Hostetter being clean out of all form, and at no stage of the race was the Pittsburger at all dangerous. Scores were:

Upson.....1111111111111111111111111—25
1111111110111111110111011—23

1101111111101111111011111—22
0111011100111111001001110—16—74

March 30.—A return match was shot to-day between the above parties and the tables were turned, the Pittsburger winning handily with the big total of 96 to 93. It is stated that the stakes in this match were larger than in yesterday's contest. In this match Hostetter was looked after by Bill McCrickart, Jack Allen looking after Upson's interests. Scores were as below, second barrel kills being ignored in the totals given:

Hostetter.....1111111111111111111111111—25

JACOB MOTZ.

TEAM RACE ON DAVIS ISLAND

April 3.—An interesting team race was shot to-day on the Herron Hill Gun Club's grounds, Davis Island. The teams were of four men each and were captained respectively by C. A. May and W. S. King. Each man shot at 25 birds, May's team winning with 85 to 78. Will King was high with 23 out of 25. The birds were an extra good lot. Scores:

South End Gun Club, of Troy.

TROY, N. Y., March 20.—The regular monthly shoot of the South End Gun Club was held Saturday afternoon, March 13, at its grounds on Carroll's Hill. The conditions were 25 targets per man, unknown angles, handicap by breaks, American Association rules. After an exciting contest, in which some excellent shooting was witnessed, Thomas E. Brown, with 6 breaks allowed him, succeeded in capturing the medal with a total of 23, beating J. E. Costello by 1 bird, who made a straight run of 22, missing 3 on the start. This is the second time that Costello has lost the medal by heavy handicaps. The weather was anything but favorable for good shooting. Complete scores follow:

	Broke.	Missed.	Handicap.	Total.
H B Tucker	12	13	3	15
John L Sheary	6	19	4	10
J E Costello	22	3	Scratch.	22
Wm H Jackson	16	9	2	18
T E Brown	17	8	6	23

W. B. CHRISTOPHER, Sec'y.

Acme Gun Club.

WASHINGTON, Pa., March 19.—Below are the scores made to-day at the weekly shoot of the Acme Gun Club, held on the Prigg range. P. Moser did not shoot up to his mark, as he is a much better man than his scores to-day show. C. Baker, Mackey and Canan shot up to their average, but J. Wylie and D. Baker were a bit off. S Werich shot his best gait. It rained all the afternoon, but we had a good time in spite of the wet weather. Scores:

E. A. WADSWORTH, Sec'y.

Rochester Rod and Gun Club.

ROCHESTER, N. Y., March 3.—Mr. Davis, a member of the Rochester Rod and Gun Club, has put up for competition a fine gold badge, to be known as the Davis Challenge badge. The first contest for this badge took place this afternoon. The attendance was very small, and the scores were correspondingly low. Below are the totals:

Weller.....1111111100?10011111011?011010111011111011101—37
Byer.....1111111110011011111011011001001110111011111110100—35
Borst.....1110100110101100001100111111111011110100010010110 1—30
Meyer.....1100111111001000001001001001011100011011100001111 1—29

March 9.—A live-bird shoot was held to-day on the grounds of the Rochester Rod and Gun Club. Mr. Sim Glover managed the shoot, everything passing off without a hitch of any kind that could be laid to the management. The only drawback was the weather, rain setting in early in the day and continuing to fall almost through the entire shoot. Under the conditions the birds could not be good ones, and the scare ropes had to be used on nearly every bird. Harry Whitney and Glover scored every bird they shot at; Glover shot at 41 and Whitney at 27. Among the shooters were E. C. Burkhardt, of Buffalo; G. A. Mosher and Hiram Bingham, of Syracuse; H. B. Whitney, of Phelps, and several members of the home club. Scores were:

	No. 1.	No. 2.	No. 4.
Weller	0	1022220	2111111
Meyers	1110	2011221	2222110
Glover	1111112	2112211	1111111

All Fools' Day at Peekskill.

A PARTY of seven shooters journeyed from New York city to Peekskill, N. Y., on April 1, for the double purpose of having an afternoon's sport at the traps of the local gun club and shaking hands with the Peekskill boys. The delegation, which left New York via N. Y. C. & H. R. R. R. at 10:30 A. M., was made up as follows: Ed Taylor, W. Crosby, Neaf Apgar, Tom Keller, Jack Fanning, Seth Clover and Ferd Van Dyke. The party was met at the train by some of the Peekskill shooters, taken to the hotel, entertained at lunch and then driven up to the shooting grounds.

Other shooters present were: J. S. Taylor, Capt. Wood, Harry Higginson, Doc Stanbrough and E. C. Likely, of Newburgh; Dr. P. H. Mason, Jack Halsted, Fat, H. P. Dain, Hill, Snowden and Loder, of the home club.

The menu at the hotel dining table was an excellent one, but the club surpassed this in its menu for the afternoon's sport:

MENU.

ALL FOOL'S DAY, 1897.

1. 10 Verplanck Points for $0 50
2. 15 Consomme, per plate .75
3. 20 Hudson River Shad, each 1 00
4. State Camp Croquettes, Miss Anout style (Potatoes extra) .50
5. FOREST AND STREAM Roast. 25 Handicap for Trophy. Complimentary 00.00
6. Conglomerate Pudding (E. C., Sch., W-A, Aust., Wals., etc.) 20 plates 1.00
7. All Fools' (one-at a-time) Café 15 everything unknown .50
8. 10 "Imperials" (cigars) $1.00 per plate. .25

It will readily be conjectured that with the above bill of fare nothing but fun reigned during the afternoon. It was a matter of deep regret to us that a case of "grip" prevented our being present on this occasion. The scores made on the above menu are given below:

Events:	1	2	3	6	7	Events:	1	2	3	6	7
Targets:	*10*	*15*	*20*	*20*	*15*	Targets:	*10*	*15*	*20*	*20*	*15*

March 27.—A full day's sport was had to-day at Elkwood Park. A long list of events was decided, John J. Sumpter, Jr., the Arkansas Traveler, carrying off first honors for the day. The chief feature of the programme was a match between Hank White, of Little Silver, N. J., and Walter Patten, of Long Branch, or rather Pleasure Bay. The conditions were 25 pairs, a style of shooting at which White is said to be particularly strong. To-day, however, he was defeated after a close race by 3 birds; the score was a tie at the end of the 20th pair, but in the last 5 pairs Patten pulled the race out of the fire by scoring 9 out of 10 to White's 6. Scores in all the events shot were as below:

	No. 1.	No. 2.	No. 3.	No. 4	No. 5.	No. 6.	No. 7.	No. 8
Daly (28)	1222	22212	02212	0	212	2122	12220	1221

Heyer (27)	....	.....	0	22110
White (28)	....	.....	1211	12110

No. 18 was also 4 birds, $3, and resulted thus: Daly (28½), White (28½) and Sumpter (30) 4, Hyer (27) and Patten (27), 3, Bart (25) 2.

No. 19 was a similar affair: Bart (25) and White (28) 3, Daly (29), Patten (27) and Sumpter (30½) 2.

A 10-bird race between Snowley and Anderson, both at 30yds., resulted thus:

Snowley.....2000220012—5 Anderson.....0200012000—3

A match at 25 pairs between W. Patten, of Long Branch, and Hank White, of Little Silver, N. J., resulted in a win for Patten, as below:

Patten	10 01 01 10 00 00 10 10 10 10 10 11 10—12	
	11 11 00 10 11 10 10 11 11 11 11 10 —18—30

OAKWOOD INN SHOOTING GROUNDS.

March 17.—The notice sent out by N. H. Astfalk, proprietor of the Oakwood Inn Shooting Grounds, near Elizabeth, that he would have a shoot at live birds to-day, brought together several well-known Jersey shooters to take part in the 25-bird race, $10, birds extra, scheduled as the main event for to-day. A 5-bird sweep shot prior to the main event resulted thus: Astfalk 5, Williams 4, Ross and Toler 3 each. Then came the main event, the scores in this being as below:

No. 2: 25 birds, $10, birds extra, 2 moneys:

Ross	2222220001202012221201211—19
Astfalk	2211222222202222022122223—22
Toler	0120001010022120211222220—16
Williams	0211222222122021111212201—22
Scott	2120122221012010212011222—20

Match: 15 birds, $20; Ross vs. Wm. Terry:

Terry	12211022110002w
Ross	2222222212212 —13

March 20.—As an outcome of the shoot of the 17th, given above, an agreement was made for a team race between the Terry Bros., of Plainfield, and Ross and Toler, to be shot to day, the conditions to be 25 birds per man, $50 per team, losing team to pay for the birds. The race was a close one, Ross's team winning mainly by his good shooting, his score of 23 out of 25 practically winning the match. Below is the score in full:

W. M. PARKER.

E. C. CUP AT HACKENSACK.

March 17.—The regular monthly shoot for the E. C. cup, donated by the E. C. Powder Co. to the Bergen County Gun Club, of Hackensack, took place to day on the grounds of the club. There was a good attendance of shooters, among them being Capt. A. W. Money and N. E. Money, of the E. C. Powder Co.; M. Herrington, of the W. A Powder Co.; J. S. Fanning, of San Francisco, representing Gold Dust powder; W. R. Crosby and W. F. Carraher, representing the Baker Gun Co., of Batavia, N. Y.; Neaf Apgar, shooting load 147; F. S. Sinnock, of Newark, N. J., winner of the contest for the *Recreation* cup last February; J. Hildreth, of the Winchester Repeating Arms Co.; Platt Adams, of the New Utrecht Gun Club; Messrs. Dawson and W. M. Smith, from the South Side Gun Club, of Newark, etc. Elmer E. Shaner, of the Interstate Association, was also present as a spectator.

The weather was not unfavorable for big scores, there being no wind to speak of until toward the close of the afternoon, when the sun came out strongly and counteracted all the ill effects that the wind might otherwise have had on the scores. The cup race was a close affair, Edwards winning from scratch with 49 out of 50; close behind him was Dr. De Wolf with 48 out of 57; Crosby (scratch), W. M. Smith (9) and T. Bell (4) were tied for third place with 47; Jack Fanning (scratch) and Sinnock (1) tied with 45 each. In the sweeps shot prior to the cup shoot Fanning made a run of something like 47 straight:

DAVID C. BREWER.

ON LONG ISLAND.

HELL GATE GUN CLUB.

March 18.—The regular monthly shoot of the Hell Gate Gun Club, of New York city, was held this afternoon at Dexter Park. It was well attended, over thirty members taking part in the club shoot at 10 live birds per man. These club shoots go to decide the ownership of yearly prizes and are shot on double handicap bases of points and yards. Below are the scores:

Thirty yards, 7 points:

Gus Nowak	2122212212—10	Eugene Doeinck	1102222121— 9

Twenty-eight yards, 7 points:

Fred Trostel	2212121211—10	John H Voss	•111•11121— 8

FOUR HANDED MATCH AT BABYLON.

March 27.—The strong northwest wind that swept over the traps at the Westminster Kennel Club to-day had, perhaps, more to do with the low scores made than the extra good quality of birds provided specially for the occasion by L. M. Gilbert & Son, of Philadelphia, and trapped and handled by George S. Mott, the club's superintendent. The conditions of the race were Gilbert and Knapp against Stafford and Butler, 100 birds per man. The former pair won with 151 out of 200 to 135! The highest score that could be made out of any string of 25 by either party to the match was 21. Gilbert scored that number in his last string, and Butler secured the like number out of his third 25. Knapp could do no better than two 20s and two 17s. The weather conditions and the quality of the birds were all against high scores. Below are the scores, showing each man's total. George Mott was referee. As regards dead out of bounds, Gilbert lost 9 of his birds that way and Knapp 7. Stafford lost 12 dead out of bounds and Butler 11. Scores:

H B Gilbert	0222220122022022222222022—19

BROOKLYN GUN CLUB.

March 30.—To-day was the day chosen for the inauguration of the magautrap lately placed in position at the grounds of the Brooklyn Gun Club. The day was a lovely one for target shooting, and the attendance was decidedly above par, considering the amount of trap-shooting that has been going on recently in the vicinity of this city and Brooklyn. Among those present were Ferd Van Dyke, of the Winchester Repeating Arms Co.; W. R. Crosby, of the Baker Gun Co., of Batavia, N. Y.; Jack Fanning, of the Gold Dust Powder Co., of San Francisco, Cal.; Neaf Apgar, representing the Austin Powder Co.; Seth Clover, of Erie, Pa.; J. S. S. Remsen, president of the Brooklyn Gun Club; T. Baron, the club's secretary; Ludwig, a shooter who, though large of bulk, hides his identity for business reasons under a short *nom de fusil;* Dick Phister, Dr. Little and others.

Twelve events in all were shot off, and about 2,000 targets thrown during the afternoon. The club's grounds are somewhat conveniently located for persons who live in Greater New York, and should prove a very popular resort under the present energetic management of the club. To reach the grounds (where shooting takes place every Saturday afternoon) take the King's County Elevated R. R. from the bridge or from Fulton Ferry to the end of the road; the grounds are less than five minutes' walk from the terminus of that road. Scores in to-day's shoot were as below:

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Targets:	10	10	10	15	20	20	20	20	20	20	20	20

FALCON GUN CLUB.

March 26.—The Falcon Gun Club held its monthly live-bird shoot at Dexter Park this afternoon. Nine members took part in the club event, which is at 7 birds, second barrel kills to count half a point. C. M. Meyer led with 7 straight one-barrel kills. Scores:

	Points.		Points.

CRESCENT A. C., OF BROOKLYN.

April 3.—To-day wound up the target shooting at the Bay Ridge grounds of the Crescent Athletic Club for the season. The attendance of shooters was not large and only five events were decided. T. W. Stake won first honors with three firsts out of as many trials. Scores were as below, all events being at 25 targets:

Events:	1	2	3	4	5	Events:	1	2	3	4	5

NEW UTRECHT GUN CLUB.

April 3.—This afternoon was the date for the semi-monthly live-bird shoot of the New Utrecht Gun Club, at Woodlawn, L. I. Ten members competed in the club shoot at 10 live birds per man, J. N. Meyer being high with 9 out of 10. J. A. Bennett this afternoon made an offer to the club in the following terms: To donate a silver cup for competition at targets on the Dyker Meadow grounds under the following conditions: 25 targets per man, class A men at scratch; class B men allowed 2 extra targets, and class C men allowed 5 extra targets; allowances to be shot out. The club accepted Mr. Bennett's offer and the first contest will be held on Saturday next, April 10.

Scores in to-day's shoot were:

Club Shoot.

C M Meyer (A)	22222•022—8
J Gaughen (A)	3•22022222 - 8
J A Bennett (A)	•2222•2200—6

Arapahoe State Bank Gun Club.

ARAPAHOE, Neb., March 27.—*Editor Forest and Stream:* On the evening of above date J. W. Den, J. H. Mooney, W. I. McKenna, E. N. Allen, M. Mitchell, Fred Boehner, Alf Garey, Charles Atkinson, C. S. Kunkel and E. C. Wagner met in the office of Fred Boehner and proceeded to organize the Arapahoe State Bank Gun Club. J. W. Tomblin was elected President; W. I. McKenna, Vice President; J. H. Mooney, Secretary; E. C. Wagner, Treasurer; J. W. Den, Captain. An executive board of six members were elected as follows: Tomblin, Mooney, Den, Baxter, Allen and Atkinson.

JOHN H. MOONEY, Sec'y.

ANSWERS TO CORRESPONDENTS.

MARSH.—What does the gauge of a gun mean? or what is it based on, or how is the gauge determined? Ans. The gauge of a gun denotes the diameter of its bore, and the latter term originally was based on the different sizes of moulds casting spherical balls; thus a 10-bore or 10-gauge was the same diameter as a ball of which 10 made a pound. The gauges are now arbitrary, as follows: Diameter of interior of barrel, 28-gauge, .550in.; 24-gauge, .579in.; 20-gauge, .615in.; 16-gauge, .662in.; 14-gauge, .693in.; 12-gauge, .729in.; 10-gauge, .775in.; 8-gauge, .835in.; 4-gauge, .1,052in.; 2 gauge, .1,325in.

PUBLISHERS' DEPARTMENT.

NOTICE TO SUBSCRIBERS.

ATTENTION is directed to the new form of address labels on the wrappers of subscribers' copies. The label shows the date of the close of the term for which the subscription is paid.

The receipt of the paper with such dated address label constitutes the subscriber's receipt for money sent to us for a new or renewed subscription. Unless specially requested to do so, we do not send separate receipts.

Subscribers are asked to note on the wrapper the date of expiration of subscription; and to remit promptly for renewal, that delays may be avoided.

For prospectus and advertising rates see page iii.

There is an art, little known and practiced, that invariably succeeds in outflanking most wild animals; an art simple in conception and execution, but requiring patience; a species, so to speak, of high art in forestry—the art of sitting on a log.

Nessmuk.

THE SPELL OF THE SPRINGTIME.

AS THE sun in its springtime orbit gathers strength and infuses its magic warmth everywhere, the annual miracle of the revivification of animal and vegetable life begins. The ice-bound waters, snow-clad landscape, leaden sky and frosty winds are forced to give place to waters aglow with the light and warmth of the sun; to fields and slopes and woodlands dressed in vivid green, refreshing and pleasing to eyes and mind; to breezes balmy, gentle and laden with the fragrance of herbs and flowers; and arched over all a deep blue sky, patched with a few fleecy, lazy clouds. The transformation from the cold and sere and dismal season of dearth to the bright and cheerful season of renewing plenty is a period during which all nature rejoices. Hardy flowers burst forth to welcome the first spring warmth of the sun, bravely risking the straggling flurries of departing winter. The unfolding of vegetable life follows in quick succession. The buds gradually open, flowers of rare beauty bloom and gladden the scene; the trees blossom and a new fragrance pervades the air.

There is brightness with beauty everywhere to please the eye. The ear is delighted with the hum of bees and the melodies of long-absent song birds. Sheep frisk in the meadows, the horses race about madly, and the cattle essay a few heavy capers; yet all are merely giving expression to a gladness which comes from the stimulus of the springtime. All nature is warmth and color and melody.

Man feels it to a more exalted degree than any other animal. The enchanting spell of the season infuses a new buoyancy into his being. He is most susceptible to the impress of nature in her kindest mood and her most beautiful adornment. Though he enjoys the charm of the present in itself, he enjoys it the more in contrast with the cold, bleak and dormant season which preceded it.

It has more than this. It has its witcheries. The open waters, with their incessant glintings in the sheen of light, and with ducks resting or feeding in the favored nooks, arouse the instinct of the duck shooter. The impulse of the gunner is upon him. He thinks of the sport over decoys, of sport in a blind, of sport in a pass, of the dusky phantom speeding down the wind which he, with a quick shot, sent plowing and splashing into the water; or of the high-flying mallard he so deftly tumbled out of the sky, to the surprise of his companions; or of the ducks which he decoyed by skillful calling, though they were suspicious of being on dangerous ground. And thinking of all this, he is indeed a better sportsman if he will refrain from spring shooting, because he thereby contributes to the general good. By refraining he denies himself a pleasure that others may have pleasure, and that he may not pawn his own shooting of the future for the momentary gratification of shooting in the present.

But the waters have other treasures. In the cold, swift streams the trout, shy, cunning and fastidious, is a worthy prize of the most delicate skill. A miniature demon of a beautiful fish—aggressive, swift of action, predatory and a fighter by nature—he casts a spell over man which reaches from the brooks to the very centers of the towns and cities. The trout fisher prowls about from store to store, inspecting new colors and forms and materials of flies. He holds long and grave conversations on rods and reels. He overhauls his fishing paraphernalia, and although he may not go fishing, he engages in all that appertains to it as earnestly as if it was foreordained that he should go. The witchery of the brooks is upon him. The fever of the season has infected him. He meets a friend, who, pressed by business cares, has forgotten all about the season. A word or two, and in a moment his friend has the fever too. The little trout in the far-away brook has cast his spell over them. The fever spreads.

It is a healthy malady. Man's mind is diverted from the exactions of business. The fever takes him out among nature's best of the wholesome and the beautiful, where there is fresh air, fragrance and pure sunlight; where there is quiet and peace and health. The impulses of the springtime, to fly to the woods and fields and brooks, are those which bring him needed rest, a recuperated being and a longer life.

CAPTAIN ANDERSON AND THE PARK.

AMONG the War Department orders issued last week was one which will be read with regret by all who have followed the history of the Yellowstone National Park in recent years. Captain George S. Anderson has been relieved from duty in the Yellowstone Park and ordered to Fort Robinson, Nebraska. His place will be taken by Lieutenant-Colonel S. M. B. Young, who has been in charge of the Yosemite Park.

It is now a little more than six years since Captain Anderson took charge of the National Park, and in that time he has done for it more than any other superintendent has ever accomplished. Within this time great changes affecting the reservation have taken place. When he assumed command a very large proportion of the residents of the adjacent territory were bitterly opposed to the protection of the Park. They regarded such protection as an infringement on their rights, and no language was strong enough to express their hatred of the superintendent and their opposition to his work. All this never moved Captain Anderson. Cajolery, abuse, threats, were alike wasted on him and left him steadfast. Like an oft-quoted American hero, when he was sure he was right he went ahead and nothing turned him aside. To-day the great majority of the residents near the Park desire to see it protected, and applaud the superintendent's efforts. When Captain Anderson went there, no law existed for the punishment of offenses, and all his efforts to put down evildoing appeared to be ineffectual; they seemed to be blows wasted on the empty air. But time passed, and in 1894 Congress enacted a law.

While Captain Anderson was not the first superintendent to insist on respect for and obedience to the regulations established by the Secretary of the Interior for the government of the Park, he was the first to devise effective methods of stopping minor offenses. For example, it has been the practice time out of mind for vain and silly people to inscribe their unimportant names in public places. The smooth white stone of the geyser cones offers a tempting surface for the lead pencils of such scribblers, and the snowy geyserite used to be liberally adorned with their names. Expulsion from the Park had usually been the penalty for the commission of such follies when detected; yet this seemed a punishment too severe, and one that conveyed no object lesson to others. Persons guilty of writing their names on the geysers and on geyser pebbles never seemed to realize that by doing this they were leaving a trail that was easily followed, since they were also writing their names each day in the hotel registers of the Park. Captain Anderson obliged any one detected in defacing the geysers in this manner to return to the spot where he had proclaimed himself an offender, and there with scrubbing brush and soap to wash out the name. This method of punishment not only afforded unbounded delight to the other tourists, but had a most wholesome effect on such persons as wished to see their own names on the formations. Captain Anderson, on more than one occasion, sent a man back thirty miles over the road to scrub out his name.

The subject of protecting the pine forests of the National Park against fire early engaged Captain Anderson's attention. His previous experience in the West was of great value to him here, although many dangers threaten the forests of the Park to which those of most of the Rocky Mountains are not exposed. The great number of campers here, and the fact that a large proportion of these are wholly ignorant of the dangers of fire or of the ease with which it may be started, make the problem of forest protection in the Park one of great difficulty. Notwithstanding this difficulty, and notwithstanding several years of exceptional drought, during which the danger of fire is many times multiplied, we believe that during the six years of Captain Anderson's rule in the Park there has been only one very destructive fire.

The numerous arrests of poachers in the Park testify to Captain Anderson's vigilance as a game protector. If the poachers were set free again and the destruction of game continued, and the poachers were rearrested and again set free, this was only because Congress year after year refused to enact a law by which violators of the regulations could be punished.

When Captain Anderson took charge, the way had in some measure been paved for his administration by the previous military superintendents, Major Harris and Captain Boutelle; yet, after all, only a beginning had been made. What was needed there then was a strong man, cool, firm and clear-headed, accustomed to dealing with men, devoted to his duty, and with a keen enthusiasm for his work. These requisites were combined in Captain Anderson, whose six years' management of this beautiful region have ineffaceably impressed themselves on it. Those interested in the National Park owe Captain Anderson a debt that they cannot pay.

It is gratifying to see that the Government at Washington has appreciated Captain Anderson's peculiar fitness for the position he has held, and has recognized the value of his services by prolonging his superintendency much beyond that of any one who has previously held the place. It is a matter of regret that he could not have been continued in this position indefinitely.

DEATH OF PROF. COPE.

PROF. EDW. DRINKER COPE, Ph.D., of Philadelphia, well known as a paleontologist and anatomist, died an Monday last at his home in Philadelphia. Prof. Cope was a Philadelphian of pure Quaker stock, born in that city in 1840. He was educated there and in Europe, and in 1866 became professor of natural science at Haverford College. It was about that time that he began the investigation of vertebrate fossil forms, which he continued until his death, and which resulted in the discovery of a vast number of new forms of the very highest interest. His earlier investigations were in the cretaceous green sand of New Jersey, but subsequently he studied the air-breathing vertebrates of the coal deposits of Ohio; and later, in 1870, made excursions into the West, where he served for some years in connection with the Hayden Geological Survey, the Wheeler Survey, and the United States Geological Survey. He was a man of abounding energy and of great ability. The ground covered by his scientific studies is extremely broad, and his papers and volumes are said to number over 350 separate titles. Two years ago Prof. Cope completed his revision of the *Batrachia* for the Smithsonian Institution, and his latest important work, just completed, was a volume on the *Reptilia*.

THE LOST MAN OF LABRADOR.

DR. ROBT. T. MORRIS sends us the report made to him by a Newfoundland correspondent who undertook to gather the particulars of the appearance and wanderings of the mysterious lost man of Labrador, about whom Dr. Morris had written in these columns. As we have said before, the theory that this individual was the "Lost Man" of the New Brunswick wilderness, of whom Mr. Frederic Irland and others wrote, was disproved by a discrepancy of dates.

The story which we print to-day is one of most extraordinary hardship and endurance, and affords an instructive demonstration of what the human animal is physically capable of undergoing when once he sets out to brave the elements. We know of nothing that can compare with this narrative except the description of Mary Shelley's Frankenstein wandering over the ice fields; but Frankenstein was inhuman, a monster of fiction; this Labrador wanderer was an actual man.

WRITE TO YOUR SENATOR.

WE print in another column a statement of the effort now making in Washington to secure a law under which the National Capital shall no longer serve as a dumping ground for game out of season.

It is a standing disgrace that Washington, the seat of government, should hold open its markets for game killed in other States and shipped to it when State laws forbid its sale elsewhere. We have a right to expect and to demand that this encouragement by the Government to game destruction in the individual States shall cease; and it should cease now.

Read the communication on page 309, and write now to your Senator asking for the enactment of Mr. Proctor's measure, Senate Bill 1488.

The Sportsman Tourist.

A LETTER FROM ANTOINE BISSETTE.

DANVIS, State Vairmont.—*M'sieu Foris Strim:* Every sin' Ah'll was leetly boys Ah'll see so many fashi'n come an' go off, w'en Ah'll look naow it seem lak Ah was been dream, or was dream naow, Ah do' know.

Fus w'en Ah'll come on de State w'en de young feller was dress up for go see de gal or ball or Fours July he'll wore long tail brass coat with blue button, an' he got collar mos' lak hoss blinder, so he a'n't able for see one side or de oder, an' he'll gat traouser strap under hees boot, so he jes' smooze lak stofe pipes.

Naow he mus' wear black coat 'f he goin' see de gal or dance, jus' sem 'f he goin' fun'ral, an' hees collar tip over, prob'ly, 'f he a'n't stan' up leetly way, an' hees traousers gat rimple all way daown, jes 'f he was been squeeze on cheese press jes 'fore he put him on.

An' de gal—oh, bah gosh, he mek me mos' crazy in mah head, he alter so fas' and so mooch. Sometam he'll had hees skirt lak one-leg trauser so he mos' can' step, but short, for show hees hankle was very pooty. Den it big 'nough for Injin wigwam, wid hoop lak barrels, or prob'ly drag on de graoun' lak peacock, so you can' help trod on it, and den he be mad lak sixty. Sometam hees dress be short on one end, sometam on de oder, so he was mek you rembler w'en you was bebbee. Sometam hees sleeve be lak hees skin, sometam lake balloons, an' sometam he'll a'n't gat any.

W'en Ah'll was young mans, hees bunnit big 'nough for put hees head in, an' he had some posy all raoun' de inside, an' Ah'll tol' you hees face look pooty an' modes' way in de back en' of it, jes' lak big posy in the middler of lot of leetly posy. Naow dey head all aoutside what dey call dey bunnit, so small you mos' can' see it, an' he can' tell if he gat it on 'fore he feel of it; an' he gat no posy, only poo' leetly bird dat was be grea' deal more pooty for sing on de bush as roos' all dead on de gal hees head of it. Bah gosh, dat was mos' bad as Injin wearin' leetly chile scalp on hees clo'se; dat mah 'pinion. 'F dey a'n't stop it, de live bird all goin' aout of fashion prob'ly.

Dar was fashi'n for heat everyt'ing wid you fork naow, an' prob'ly you'll gat for heat pea soup wid it, a'n't it? An' you'll gat for wap you mout' wid leetly tableclot' 'stead of you han'; an' it weeked for pour you tea on you sasser some more, an' blow it for cool.

W'en Ah'll was young mans dey a'n't anybody dat was brought up much dat was chaw gum. Naow you see lot of dress up folks chaw lak he heatin' tough ol' beef he can' swaller. You go on de store, an' de clerk wid hair part in de middle an' ring on hees finger showin' de calico an' ribbin to pooty gal, all dress up too, and dey bose of it chawin' "n'gou n'yum, n'yum, n'yum," lak hol' caow chaw hees cud, so you mos' can' on'stan' him. It more fus' it was for chaw tobac, an' a'n't grea' deal more pooty.

De fashi'n was change in de way folks talk sin' Ah'll was l'arn for spik Engleesh, but Ah was stick on to de hol' fashi'n, me.

Wal, seh, Ah'll see de fashi'n, Ah'll hear de fashi'n, Ah'll feel of it, but de curies' was for smell of it. Yas, sah, all de peop' dat was dress up naow was preffume hees clo'se so he'll smell jes' sem he was been trap moosrat, mans, hwomans, all of it. You shook hees han', you touch hees clo'se, it come off on you so you smell jes' de sem. Bah gosh! Ah'll call it queer fashi'n for everybody smell jes' de sem, a'n't he?

W'en Ah trap moosrat in de sprim, w'en Ah'll go on de store, dey mos' can' bore me, dey holler "Whew!" an' squeeze dey nose, Ah'll so preffume, but dey all raght for have it on dey hamperchy, an' dey clo'se so t'ick you'll a'n't able for draw you breeze. Ah'll a'n't lak dat pooty well, 'cause sass for geeses jes' good for ganders, a'n't he? Wal, seh, Ah'll goin' tol' you story 'baout dat.

You see, dey have it Chris'mus ball on Hamner Hotel, an' Ah'll took notion Ah'll go, 'cause Ah'll a'n't be'n somewhere sin' Fours July. Ah know dey won't prob'ly let hol' Frenchmans dance in dat fancy co'pany, but Ah'll can heard de music an' heat some suppers jes' sem as somebody.

So Ah bought ticket day 'fore for be sure, an' dat evelin' Ah'll put on mah bes' pair clo'se an' start cross lot. As Ah go 'long Ah'll come where Ah'll gat trap set for skonk, an' Ah'll see he was pull in de hole, an' Ah'll t'ink Ah keel it so he a'n't be suffer. So Ah'll gat steek all ready for struck it an' begin for pull de chain softle, an' bah gosh! dat feller gat more preffume he want for heese'f, an' he give me more as Ah want too, raght on mah traouser, an' full up dat lot all full, more as twenty nacre.

You s'pose Ah'll goin' home for leetly t'ing lak dat? No, seh, Ah'll a'n't goin' loss mah ticket on dat ball 'cause mah preffume a'n't sem fashi'n lak dey gat. So Ah'll knock de skonk an' go on mah beesnes.

W'en Ah go on Hamner dey all beegin heatin' dey suppy, an' Ah'll walk raght up on de diny room sem 'f he beelong to me. Pooty quick dey use dey nose more as dey jaw, den dey all try for be fust for de door an' it a'n't more as fav minute 'fore Ah'll was all 'lone. 'F you ever see forty chicken w'en hawk come daown on de barnyard, den you see haow de folks scratter.

Ah'll sit daown to de table w'ere de victual was be t'ick, turkey, chicken, r'oysty an' oysty, bose kan of it, tongue beef, ham meat, everyt'ing. Dey a'n't nobody for wait on me, but Ah'll able for help mahse'f very well, t'ank you, an' Ah'll bet you head somebody a'n't never heat so much on Hamner as Ah'll was. It mek him mad for see one mans full up so, Ah tol' you.

He come hol' hees nose on de door an' holler: "Git aout dat, you hol' Frenchman, you," an' Ah'll tol' him: "A'n't Ah'll got ticket, hein?"

He'll ax me, Ah'll a'n't gat some beesness for be so preffume. Den Ah'll tol' it, "A'n't every mans gat raghts for took hees chouse on hees preffume, a'n't it? You folks took hees chouse on moosrat; dat all raght. Ah'll a'n't say not'ing, a'n't Ah? Ah'll a'n't run off, a'n't Ah? Wal, seh, 'f Ah'll took mah chouse on skonk an' dey mine for run off, dat a'n't mah beesness too, bah gosh. Ah'll a'n't tol' it for go, me."

Den Ah'll took some more turkeys an' put t'ree spoonful w'ite sugar on mah coffee. Dey 'fraid for touch hol' of me, for fraid de preffume rub off on it, an' bamby dey come for push me wid pole; but Ah'll tol' it Ah'll paid for mah suppy, an' 'f dey drove me 'fore Ah'll heat it, Ah'll sue it up to de law.

So dey let me 'lone some more, stannin' way off wid dey nose in dey finger, lookin' at me t'rough de door an' winder, jes' sem you see cat watch dog heat hees breakfus'.

Bamby, w'en Ah'll had more as Ah'll want, Ah'll gat t'rough, an' sot back an' pick mah toof, 'fore Ah'll holler to Hamner, de suppy was very nice an' plenty for me, an' sem tam Ah'll willin' for de company heat 'long to me. Ah'll was very 'bliged to it for go aout, 'cause de moosrat preffume was very disagreeably for me w'en Ah'll heatin'.

Den Ah'll go, an' long as Ah can hear Ah'll hear it call me more as forty deeferent kan of Canuck, 'cep' good one. But Ah'll felt so comfort, Ah don' care, me, an' Ah'll go 'long home w'istlin' jes' lak rooster, an' dat all Ah'll said.

Your very respectably,

ANTOINE BISSETTE.

SHOOTING IN THE BOHEMIAN HIGHLANDS.

THE sun is just up, and the dew on the grass sparkles like priceless gems.

Our rendezvous is on the high road, and at the boundary of some particular *Revier* which the chief forester has determined to be the scene of our sport on this occasion. One by one carriages roll up, and warlike looking individuals clad in loose wraps get out, and divesting themselves of their covering display shooting costumes of Tyrolean *Loden*, warm and waterproof. Gun barrels gleam in the red sunlight, game bags full of lunch and cartridges, flasks full of good red wine, refreshing even when warmed by the sun; every gun slung by a strap over the shoulder.

The dogs chase to and fro, eager for the sport to begin.

Finally the last guest has arrived, and with a little speech announcing the game of the day to be the partridge, the chief forester gives the signal to advance.

A dozen hunters deploy to right and left, while between them step in the game beaters. The line now advances, the dogs working beautifully in front.

Our course lies over a rolling country, planted largely with potatoes and sugar beets, in the shade of which the partridge loves to "bathe" in the soft earth. Woe be to him not provided with leggings or high boots, for the vines will soon wet him above his knees as he plunges through them.

The German *Rebhuhn*, or partridge, is as large as a pigeon, and has only three toes. It cannot perch upon a tree or fence, consequently, but is always found upon the ground. The young birds have yellow legs, which become gray with age, and the cock has a red shield on his breast.

As the line advances the dogs point from time to time, and with guns ready we slowly advance, and as the covey "raises" each hunter chooses his bird directly in front of him. The game not bagged at once flies forward and is flushed again later.

About 10 o'clock a halt is made and a sandwich and a glass of beer are indulged in. It is still too wet to sit down—unless a convenient stone can be found.

Away we go again. The sun grows powerful, and perspiration and gunpowder smoke transform us into a company of Moors.

We have gradually ascended, and now we look down over the borders of Bohemia into Saxony, "*Sachsen wo die schöne Mädchen wachsen.*" Behind us loom the *Isergebirge* and old Jeschken's cone, while ahead of us the restaurant on the summit of *Gigelsberg* beckons alluringly and hints of cool beer served by pretty waitresses.

We wonder if our path to-day will extend within reach of its hospitality.

The fields of oats and rye are not yet reaped, and they fairly scorch us as we work our way around them. A few weeks later and we will have an open country. However, Bohemian grain fields are mere garden spots in point of size, and do not interfere much with our march.

About noon we come to a spot, selected beforehand, where in the shade we find a table set with bread and butter, cheese, cold game and plenty of beer and wine. Cartridges are withdrawn, guns secured, and it is with a relish that only follows hard work that we eat our dinner; then we rest on the grass, smoke and swap lies, called by the polite Austrian "hunters' Latin," and discuss the more remarkable features of the day's sport.

The sun grows less powerful, the atmosphere becomes gray; over the tops of the mountains come rolling heavy clouds, which tumble down upon us; the air becomes chilly; it begins to drizzle, and finally pours. Old Rübezahl resents our trespassing upon his domain. Small wonder that the superstitious peasant believes implicitly in the God of the Mountain when the weather can make such sudden changes as this. Quite as suddenly, however, the mist rolls away, and old Sol comes out as hot as before, while we tramp along with soaked feet.

About sundown we arrive at some village inn, to which our carriages have been sent, and partake of the simple meal of roast pork and potatoes with cucumber salad. After the meal the *Oberjaeger*, who sits at the head of the table, takes out his little book and notes the number of birds killed by each hunter, and much fun arises from the fact that the total number of birds actually killed is usually less than the number reported shot by the respective Nimrods. This is sometimes due to two hunters claiming the same bird, but I am afraid that exaggeration sometimes is indulged in. The number of misses is next asked of each hunter, and he must pay two *kreutzers*, or about 1 cent, into a fund for the education of foresters' children for each miss.

The most successful shot is then proclaimed king by the *Oberjaeger*, and glasses are filled and healths are drunk with the fortunate individual, who must try to make a more or less witty speech. After this the party is free to drive home as they please, though some of the older men may sit longer over a friendly game of *Skaat*.

The result of such a day's sport will be, in a good season, 300 to 400 birds.

A more interesting hunt for an American takes place just before Christmas, when the ground is frozen and covered with snow. This is the *Kreisjagt* or circle hunt. The game is hare.

A hundred hunters more or less, with as many beaters, are on hand; and at the direction of the *Oberjaeger* the *Jaegers* step out in opposite directions, followed at intervals by the hunters as designated by the *Oberjaeger*, and between every pair of guns is a beater. Each *Jaeger* leads his line to form a great semicircle, finally meeting his colleague, and thus forms a circle a mile or more in diameter. As soon as the *Jaegers* announce with their horns that the circle is completed, the *Oberjaeger* blows a signal for the whole line to advance slowly to the center. Every now and then a shot is heard, and a hare is seen to roll over or to run across the circle, only to meet the deadly row of guns on the opposite side. The circle grows smaller and the firing more rapid, while the number of perplexed hares scampering from one side to the other increases. The *Oberjaeger* now blows his horn to indicate that the circle must no longer be fired into. We still advance, but allow the hares to break through the line, turning and shooting them after their escape.

The circle has now become quite small and seems alive with hares, so the third signal notifies the shooters to stand fast while the beaters advance alone. Now comes the exciting moment, when it seems to rain hares. Only one instant; but hares to the right and left break through the lines, running for their lives. The guns boom like an engagement of infantry, and when the smoke clears away the ground is strewn with the slain.

Several hundred hares are the result of such a *Kreis*, and these are hung on frames fitted to the backs of some of the beaters, who are dispatched home with the booty.

Enough hares escape always to prevent their extermination, and the game is sold to wholesale dealers at from 30 to 50 cents each. Thus the result of such a day's sport nets the proprietor several hundred dollars.

Another pleasant hunt is that for the roebuck.

Here, after the usual speech from the *Herr Waldbereiter* warning against shooting a doe, and urging strict compliance with the directions given as to the line of fire, in order not to endanger the life of a comrade, the hunters receive their stations, surrounding a piece of forest, and at the signal of the forester's horn the beaters start through the thicket, hitting the trees with their sticks and making a terrible racket. Each hunter is on the *qui vive*, for any moment a buck may dash out, and not to shoot would subject him to as much ridicule as to shoot and miss. A shot cracks now and then, and he wonders who the fortunate hunters are, and comforts himself with the reflection that he knew in advance he would not get a shot, when a rush, a crackling of bushes, and—bang! "By George! he's gone." Crestfallen he stands, not daring to move, until the *Jaeger's* horn announces that the *Treib* is over.

Soon the *Oberjaeger* appears, inquiring who fired, and Nimrod admits that he fired and probably missed. A dachshund with a *Jaeger* follows the trail of the animal, and in a few minutes shouts announce that the game has been found, much to the satisfaction of our crestfallen friend.

A moment later and the *Jaeger* emerges from the brush with the buck on his shoulders. Nimrod then tries to convince everybody that he knew all the time he had bagged his game. The *Oberjaeger* now breaks the tip off a branch of pine, and with due formality presents it upon his hat, and this trophy the fortunate gunner wears proudly in his hat as evidence of his skill, presenting it to his best girl that same evening—if he is not too tired.

JOHN B. HAWES, M.D.

THE VALLEY OF PLEASANT REMEMBRANCES.

DOUBTLESS every lover of the woods and fields has, among his recollections of pleasant places, a remembrance of some particular spot which has for him a peculiar charm, and when his thoughts turn to the woods, and a panorama of beautiful scenes flashes across his memory, there is always one scene that stands out in unusual clearness and recurs with persistent frequency. In time he comes to look upon this scene as a type, and whenever he thinks of the country it is this particular part of it which, in his mind's eye, he sees first; when he longs for a breath from the pines or meadows it is the fragrance of this spot which imagination brings to his nostrils, so that it finally becomes symbolic of his ideal country.

* * * * * * *

Hidden away among the grand old hills of Petersham and Barre is a valley which might, at this day, well be called Peaceful Valley. Many years ago this valley was the home of a large family, at whose head was a strong man. It probably never occurred to any of his fellow townsmen to think of him as a strong man, yet he had so impressed upon this valley his personality that even its original name was lost sight of, and it came to be known by a title which always associated with it this strong man. In those days it was known as Pirate Hollow.

By most people it is now called Swift River Valley, from a branch of that river which follows the valley's course, and a most delightful bit of country it is. There is no other place quite like this valley to me, one reason for which is very likely the fact that my outings there have always been made with friends—not society friends, nor even the friends of business, but the objects of that stronger, deeper friendship, the friends of the stream and cover.

In our eyes this is a wonderful valley, for we have found there that rare attainment—satisfaction. It is a great thing for a modest country valley, this satisfying of a human being. It is a great thing for a valley, this consciousness that men carry away from it only pleasant recollections; that they come again, year after year, to wade the cold waters of its streams or thread the alders of its covers, and go away with little thought of trout or game, but with brightened eye and expanded lungs—cheerful, satisfied.

For many years we have made our pilgrimages to Swift River. The valley always holds out a hope, for there are trout in its streams and birds in neighboring covers. Years ago both were plentiful and the valley had a certain fame; but now little remains of either save the memory of what used to be, and the valley is forgotten. But the river is so bright, so companionable, and looks so "trouty," that it always seems as though we could find a few nice ones if the water was right. And the alders and birches are so clean, so inviting, that they must hold any number of woodcock. If only we could catch a flight. If the signs were only right.

And so we go year after year ostensibly for trout or birds, but really to see the dear old valley again; for we have fished the streams when weather and water were most auspicious, hunted out the hillsides when every cover nearer home was holding flight birds, and always with just enough of success to save the trip from failure.

And now we have come to look upon this valley not as the valley of trout or birds, nor even as the valley of Swift

River, but there has grown up within us a name based on associations rather than on locality. To us it is the Valley of Pleasant Remembrances.

In the Valley of Pleasant Remembrances there are no harsh notes, no discordant colors. Not a house has been built there since I first made its acquaintance. In the long ago there were mills to pollute the water with their refuse, and fill the air with the hum of unseemly sounds; mills wherein men with the sordid commercial instinct ground out the lives of fellow men, with little thought other than of how many cents' profit per day could be realized from each one's labor. Then it was Pirate Hollow.

Now the mills are gone, the house where lived the strong man has been long deserted, and the only tenants of the valley are a few farm owners.

In the Valley of Pleasant Remembrances the hills are always fresh and green. The few cultivated fields are so scattered as not to appear out of harmony, and the advent of that ravisher of nature, the steam sawmill, is as yet only a fear, a dread.

In the Valley of Pleasant Remembrances the waters are always clear. The streams head in cool springs far up on the hillsides and sweep down through the valley, churned into foam by the rocky stream beds, kissed by the sunlight, and with never a pause where contamination might lurk.

There never were greener pines than those which cover, like a mantle, the rugged cliffs of "Gray's Mountain;" there never were cleaner birches than grow on the slopes of "Popple Camp," and there never was such crackly, sparkling ice as "Pat" harvests yearly from Swift River Pond.

Is it any wonder then that the city folk, summering at the fashionable hotel on the hill, are frequently to be seen riding or driving on the valley roads? Is it any wonder that, with the approach of each trouting season, I hear the robins and thrushes of Swift River pouring out their songs of gratefulness at being there; that I smell the pines of old "Rum Rock" or hear the partridge drumming down "Rutland Brook?" Is it any wonder that there comes again a longing to see once more this delectable valley, where all is peace and restfulness, to add one more to an already long list of happy memories "that rust cannot corrupt?"

If a man's wealth were only reckoned from his recollections rather than from his gold, how rich would be the lovers of the woods, and what an El Dorado would spring up in the Valley of Pleasant Remembrances.

THE LOST MAN OF LABRADOR.

HARBOR GRACE, Newfoundland.—*Robert T. Morris, M D.:* Dear Sir—According to promise I have made inquiries concerning Gilmer Carns. I have also engaged the attention of our local papers, particularly the Harbor Grace *Standard*, to make inquiries relating to him. The result I here inclose: During my vacation on the coast of Labrador the past summer I received the following information while taking passage on the Labrador mail steamer Virginia Lake:

Aug. 27, 1896.—Salmon River on the Canadian Coast, Labrador, Gulf St. Lawrence.—Thomas Sweet, of this place, says that in April, 1893, a strange-looking man walked here to our fishing station in a most pitiable condition. All the outfit he had was a small axe, a tin pan and a pair of snowshoes. His clothes were torn, his boots worn out. He was hungry and asked for food, which we gave him; he said that he had traveled from Quebec during the past winter; that his name was Curry and that he was going to Newfoundland.

We were somewhat frightened to think that any man could walk all the way from Quebec, over mountains and forests, through the snow and frost of a severe winter and a distance of over 800 miles, and with no food, no covering from storm or frost. Men experienced and living on this coast think it impossible for man to perform such a feat and in such a short space of time. He stayed with Edward Grant one night. Next day he left and traveled on to the north again.

Going north, the next port of call for our mail boat is Blanc Sablon, which is the westernmost part of Newfoundland dependencies on Labrador. There again this stranger appeared in the month of April; I could not get particular dates.

Traveling on north still, he got on to Red Bay, having about seventy miles to walk from Salmon River to reach that place, with no roads, nothing but piles of soft snow and mountains to get over, and barren plains and rivers to cross on the ice. Thomas Yetman, of that village, interviewed him there. He had a small axe, a tin pan or drinking cup, and a pair of snowshoes. He put up here one night. They gave him food to eat He would not take any food with him when he was leaving.

Henly Harbor is about forty miles to travel from Red Bay further north. Here again we find him; John Stone says: "A man came to my house about the first of May, 1893. Said he had walked from Quebec during the past winter. His clothes were a loose coat, a Scotch cap, a pair of moccasin boots nearly worn out. He had with him a small axe and snowshoes. This being an island, he came here by crossing on the ice. The ice broke up and I put him on the mainland in a boat. He walked from Henly Harbor to Cape Charles over mountains, crossing rivers and arms of the sea by means unknown to us, a distance of over thirty miles, and with not a living being within that distance to assist him with food. You must know that there are no roads on any part of Labrador. So that in my opinion he must possess something more than human endurance to be able to climb over such high mountains, and down again into the valleys, with many feet of soft snow and running water to wade through."

He must have got to Battle Harbor by crossing over from the mainland of Cape Charles on the ice, as Battle Harbor is on an island, with about thirty families living there.

Mr. Isaac Smith, of that place, makes a statement and says: "Some time in May of 1893 a stranger came here, who said that he walked from Quebec. He had with him a small axe and tin dipper. He appeared to be very fatigued. I brought him to my house and gave him food, and lodged him for two days and mended his boots. He slept in a bed with me. He appeared to be a very intelligent man. I did not think that he was insane. His height was about 5ft. 7in.; brown mustache; hair very thin; think part of his head was bald. Told me that his name was Cawley. That he had a sister living in the States, where he belonged, and that on account of the demoralized condition of the place he left it and went to Quebec."

I asked Mr. Smith what religion the stranger was professing. He said he thought that he was a Catholic, "for he spoke in favor of the Pope and he got like a madman abusing me when I said anything to the contrary; so that I had to tell him to be quiet. When I knelt to pray before going to bed he also knelt to pray." I asked: "Did you see him make the sign of the cross before he prayed?" Mr. Smith said that he was not sure, but said he knew that he made ugly offers at it. He also said that the stranger had a large pocketbook with him; he kept it inside his clothes, there were a lot of papers in it; he also had a curious knife that he used to shave with; and there were letters on his shirt; the second letter was C, but he did not know the other one. He also told me that the stranger gave Mr. Green, of Seal Islands, a prescription for medicine written in Latin; there was no person there who could read it, and there was not a drug store at that time within 200 miles of Seal Islands.

After two days he went on north Three days later he was seen at Frances Harbor, and on the 22d of May he crossed St. Michael's Bay on ice that would hardly bear a cat. A trapper who resides there during the winter time saw him and was scared to see the man out in the bay on such ice. Between falling through and getting up on the ice again he reached the shore. The trapper allowed him to dry his clothes in his hut and gave him food; and he went on again.

Five or six days later on he got to the next settler's house in Snug Harbor. This settler's name is James Ward, who says that when this strange man got to his place he was very much fatigued; his boots were worn out so much that his bare feet were on the ground or on the snow; his feet were bleeding; his toes were very sore, caused by being frost-bitten. "We did the best we could for him, myself and my sister; we poulticed his feet, mended his boots with sealskin, washed and mended his clothes. During his stay with us, which was three days, he appeared to be well educated. He used to read our Bible and sing hymns for us. He said that he belonged to the Episcopalian Church. We put him across the bay three miles to Venison Tickle, where there is a winter station. He knew nothing about a boat; he could not row the boat, and his hands appeared soft and fine like those of one not used to work with his hands."

This last remark would show that he did not speak truthfully when he said that he had been serving on board ship. He also called himself different names in the different places that he went through, but strange to say that the names he gave himself always began with the letter C; sometimes he called himself Curry, other times Cawley and Collins.

He left Venison Tickle after a stay of one day. The next place that I heard from him was in Cartwright, Sandwich Bay, which must be over 100 miles northwest for him to get over by land

Dear sir, with my knowledge of the coast line in that part of Labrador, if any man were to tell me that a man walked there from where the Venison Island people landed him, I would say that it was impossible However, it is a fact, for he got there, as is well defined by a letter from Mr. Payne, clerk in the employ of the Hudson Bay Company. In fact he must have swum across inlets and rivers, clambered over precipices, down again through ravines, gullies and gulches, and more places through tangled undergrowth forest; and without food or shelter from rain and storm, I cannot think of any way by which he could have sustained life. if it is not possible to do so by eating heathberries or Marchberries, of which he could very likely have found some when the snow melted off the ground.

Mr. Payne's letter in the Harbor Grace *Standard* shows that the strange man got there on June 26, 1893. Mr Payne's guess at his age differs very much from those of all the other people I questioned on that point. Some say that he appeared to be about thirty-five, others forty or over. Some people say that the portrait sent to me by the FOREST AND STREAM was like him; others that it was not like him. He was but a short time in any one place, so that people may not remember his features. Mr. Smith, of Battle Harbor, said that it was his likeness.

After leaving Cartwright he proceeded on to the north, and after another hundred miles or more of the same sort of country as previously described, without the habitation of a living being, he reached Hamilton's Inlet, at the Narrows, and by some means crossed over to Rigolette, where there is another station belonging to the Hudson Bay Company. There he was nearly being devoured by Indian dogs, and but for the timely assistance of the owner of the dogs he would have been torn to pieces. Crossing this river he lost his axe, so that he was without a weapon to defend himself against dogs or bears or other wild animals.

He next appeared at a place called Holten, fifty miles further on, where the people saw him swim across a harbor a half mile wide, with his clothes tied on his head, and again at Cape Harrison Harbor. From Cape Harrison he took to the forest and mountains again. Although by this time he had summer weather, it being well up in July, his endurance must have been something wonderful, where he had to exist on the few stunted berries that remained on the ground from the year before.

About 100 miles north of Cape Harrison, on a straight line from headland to headland (which must be double that distance for him to walk), we find report of him again, in a very poor condition, as follows:

Capt. J. J. Hennessy, who does trading business at Winsor Harbor (a place about twenty miles southeast from Hopedale) during summer time, went to an inland bay in a schooner. On his return in the night, when passing by a point of land, he heard a human cry coming from the shore. The night was cloudy, with little or no wind, and if you spoke above the ordinary way of speaking you would hear the echo of your voice coming back to you in a most extraordinary manner, so that the human cry or call coming from the shore over the smooth surface of the water and its echo sounded most dismal when one was not expecting to hear or see a human being so far from the habitation of man. The words came like this, "If you don't assist me to-night I shall die." It was with no little fear and hesitation that Capt. Hennessy lowered a boat, armed the crew and went on shore. To their great surprise, the person whom they had to encounter was not, as they expected, a desperate, wild maniac, but a weak, half-starved man, who bore all the traces of having undergone days of starvation and incredible suffering. He confessed that he had seen no food for eight days. Capt. Hennessy took him on board, gave him same food, and was surprised to see him so soon recover from the effects of his long exposure. His clothes were torn into rags, boots worn out, his bare feet on the ground. Capt. H. gave him some clothes and a pair of boots. He told the captain that he had walked from Quebec. He had not the small axe now in his possession which he is reported to have had on former occasions. Capt. Hennessy says that he appeared to him to be a man of about forty years old, in height about 5ft. 6 or 7in.; does not recollect color of hair, thinks he had light-colored whiskers; hair very thin on his head, turning gray; could not identify him by the FOREST AND STREAM portrait, which I showed him.

He told the captain that he intended going to Hudson Bay, where he expected to get a situation. He said he was a printer by trade, and if he did not succeed in getting a situation at Hudson Bay he would return to St. Johns. The manner in which he tried to conceal his identity by giving different names and telling different stories, and his sudden disappearances, seem to indicate that he was trying to flee from civilized man.

After staying two days at Capt. Hennessy's place he suddenly disappeared and was heard from next at Cape Harrigan, thirty miles north of Hopedale, having gone there in a boat with some Indians.

From there he must have got a passage in some fishing schooner to Nakva, north of Cape Hugford, for we find that he crossed the peninsula to George's River, Ungava Bay, where there is a station belonging to the Hudson Bay Co., and kept by a man named John Ford. It is reported that Ford knew from some Indians that this man was on his way northward, and thought him to be an enemy of his, whom he had injured some years before, and who had vowed to return to Ford's place to kill him. It is also reported that Ford became alarmed and asked the Indians to protect him. However that may be, this stranger arrived at Ford's place in the winter of 1893–94. Ford states to his friend that this strange man arrived there and was teaching his children for some time during that winter. One night he rushed to the door of Ford's room, calling out: "Mother! mother! she is in there. I saw her." Ford called his men, who tried to catch him, but he ran up a snowbank on the back of the house and either fell or jumped over the front of the house, falling on a boat and killing himself. Ford says he was buried there.

This is all the information which I have of the strange man. But one thing I wish to say is that the large pocketbook containing papers, and which he kept with such care, should be found and reported of. The harbor in which he is reported to have died is in George's River, Ungava Bay, and is on Canadian territory.

Whether this strange man be Dr. Carns, or whoever he may be, his journey from Quebec and along the Labrador coast to Ungava is remarkable for feats of endurance and adventure which are almost superhuman.

NICHOLAS FITZGERALD.

TALES TOLD BY THE CAMP-FIRE.—IV.

BY AMATEUR.

(Continued from page 282.)

ON the next evening another of our number said:

"Some years ago I had occasion to make extended researches into the early history of western Pennsylvania, and especially of Fayette and Greene counties.

"Fayette county contained numerous forts and block houses, built by the early settlers for protection against the Indians, and was traversed at several points by the old 'Indian warpaths,' which were traveled by the red men long before the white men came into the country. The Great Catawba warpath starting in New York State was one of these, and the celebrated Braddock road, in the eastern part of Fayette county, follows that warpath for many miles. The Braddock road was laid out by George Washington, and started near where Confluence Borough, in Somerset county, is now situated. That point was known to the Indians, and named by them Turkeyfoot, because the North Fork, the Castleman and the Youghiogheny rivers unite here in what, viewed from the surrounding high hills, bears a strong resemblance to the foot or track of the turkey; and it was so known to the whites even in my boyhood; but a town was laid out there and the name Turkeyfoot, which was full of historic association and significance, was thought too homely—too paganish, if you will—and was supplied by the name Confluence, which the place bears to-day. Here was the Big Crossing of early history, while the Little Crossing was some eight miles up the stream, exactly where the old stone bridge, on the National road, is situated, at the town of Smithfield—though from the name of the post-office it is more often written Somerfield. Washington's feet have trod all over that country.

"Somerset county was not the scene of any great Indian outrages or outbreaks, but their murders in Fayette and Greene counties were numerous and most cruel. Our friend's story of night before last and the one of last night have brought to my mind a number of recollections of which he may not know, and which, following his lead, I shall rehearse.

"Our friend's great-grandfather was named Elias Blank, and he was one of the early, if not the earliest, settlers of Greene county, Pa. He derived his patent from the Penns direct, and his particular homestead was called 'Delight.' On it there was a very high hill, and on top of that hill was a tree, and it was the old man's boast that he could sit under that tree and not see off his own land except when he looked beyond the Monongahela River into what is now Fayette county. As our friends have indicated, it was customary to carry down the name of the father to the first born son. Elias Blank's son Elias died young, but the name Elias was given to many of his grandchildren, as was the name Aaron of one of his sons, the 'Een' of whom we have heard.

"Dunkard Creek is in Greene county and was the scene of many terrible Indian outrages. It was so named from a settlement of people belonging to the Dunkard Church, to whom Elias Blank gave a grant of land along that creek, which flows into the Monongahela River. Elias Blank's grant from the Penns is a peculiar one in that it gives to him, his heirs and grantees the right to fish and to draw nets in any running streams on the land granted by Penns to Blank, and specifies the Monongahela and the creek flowing into that river, designating the Dunkard Creek by its Indian name, which I have forgotten. The Dunkards were Baptists, but believed in trine immersion and some other peculiar doctrines. Elias Blank was a Quaker.

"In early days a man named Bowers settled on the Dunkard Creek, and had a grant from Elias Blank of lands lying on both sides of that creek for eighty perches up the creek from the Monongahela River. Bowers was a Baptist, not a Dunkard, and did some great favor for old Elias, which brought him the grant of land. But in that grant Elias Blank gives to Bowers and his descendants forever

the right to fish in the creek whose Indian name was —— and now known as Dunkard Creek, from the big sugar tree which marks the west line of this grant, and stands on the north side of said creek, to that point in the Monongahela River at which the waters of the two streams cannot be distinguished by the eye; and to draw nets in said Dunkard Creek and that part of said river in consideration of certain benfits received, and in further consideration of the payment to the grantor during his lifetime of the first fish taken each year; and further in consideration, that the grantor and his descendants may demand as a right from the grantee and his descendants forever the right to draw one net in the waters covered by this grant in any one year, and should this right ever be refused them when demanded, this fishing right shall revert to the grantor and to his descendants after his death.' This, as nearly as I can give it, is the wording of that old grant, which is of record in Greene county.

"But after the Legislature of Pennsylvania passed the first act relating to fishing with nets in the waters thereof, an attempt was made to break up the Bowers fishing in the Dunkard Creek—along in perhaps 1873 this was—and Bowers was notified time after time (he was perhaps the third in direct line from old Bowers, to whom Elias Blank made his grant); but he paid no attention to the notices, and he was finally indicted in the Court of Quarter Sessions of the Peace of Greene county. He employed no lawyer, but came to court, and when his case was called appeared and said he 'would try his own case and make an end of it very quickly.'

"The judge was familiar with the early history of Greene county, and asked him what he had to say.

"Bowers replied that the Legislature of Pennsylania had no authority over him and his fishery; there was his grant from Elias Blank, whose grant from Penns was on record, and the act of 1779 gave full faith and confirmation to both of them, and before any further steps were taken he asked the Court to decide, as matter of law, whether or not the said grants and the act of 1779 were a protection to him, and the fishing right vested in him as a descendant of the original grantee of Elias Blank, and not in the Commonwealth of Pennsylvania.

"This created a commotion. The judge examined the papers and the act, declared that the signature of old Elias Blank was well known, the paper genuine, and Bowers's right fixed. He directed a verdict of not guilty, at the cost of the county, and advised Bowers to have the grant from Elias Blank recorded, which was done. This fishery is a very valuable one; large fish come up the Monongahela and are caught as they attempt to pass up the Dunkurd Creek.

"Old Elias Blank's house was often the stopping place of the famous Indian fighters, the Whetzells, of whom we all used to read when we were boys. They were Jacob, Martin, John and Lewis Whetzell. All were celebrated Indian fighters; but Lewis Whetzell is the one whose fame became most widely spread, and mainly on account of his having acquired the ability to load his rifle while running at full speed—a very valuable accomplishment.

"Old Elias Blank was a Quaker and used 'thee' and 'thou' in conversation, which his son Aaron or Een also frequently did, especially when he wanted to be impressive, or when talking to one he didn't like. When Een Blank began to thee and thou anyone against whom he had any cause of complaint, the latter always cut the colloquy short.

"Old Elias Blank possessed some means, which he never divulged, of obtaining knowledge of the movements of the hostile Indians, and it was customary to watch for smoke rising from the high hill on his tract called 'Delight,' which I have mentioned, or for a light at night in the top of the big tree on the top of that hill, and when either of these signals was given the settlers hurried to the forts and block houses, and old Elias was never known to make a mistake. He was attacked, however, in his own house by a band of wandering Indians on one occasion, and finding no other way of escape killed eight of them with his own hand. He never after took part in Quaker meetings, believing himself a 'man of blood,' and a saying went abroad among the Indians that 'Broadbrim had taken the tomahawk and was worse than the man whose gun was always loaded' (Lewis Whetzell).

"After the Revolutionary War Albert Gallatin founded a little town in Fayette county, Pa., on the banks of the Monongahela River, which he called New Geneva, and just opposite in Greene county old Elias Blank founded a little town which after Gen. Greene he called Greensboro. Between the two is a ferry, a very valuable piece of property, and the right to which is provided for in the grant of the Penns to Elias Blank, and it was in operation long before either town was laid out. Old Elias established a quit rent on the town of Greensboro, which still is in force, one of the very few remaining in Pennsylvania. This quit rent and the ferry still belong to his descendants, and are considered valuable property.

"I have in my possession a gun made by Ezra Engle, from our friend's description last night, I suppose Ezra IV. This gun is well authenticated, was made before the Revolution, and has been in my family ever since; it descends to the oldest son. It has the peculiar trigger action spoken of, the original flintlock, the copper fore sight set in the barrel and the elevating rear sight. This gun has no ornamentation at all, is full-stocked, the thimbles for holding the ramrod are made of iron, seemingly, as is the trigger guard. A peculiarity is that the gun never becomes rusty from shooting, and no iron part of it will rust; neither can you brighten the iron. The gun shoots a ball of which 100 weigh exactly 1lb. I have the old bullet moulds too. The barrel is 3ft. long inside, rifled with four grooves and one full turn, very deep. The stock is a curly maple with natural bend, but the butt piece is a walnut knot sawed to shape, as is the end of stock at the muzzle; but I have never been able to determine how they are fastened in place. I shoot off the old gun loaded with a bullet once every Christmas Day, unless the day falls on Sunday, when I fire it the day before, and lay it away to the next year. It is a very well-preserved gun, and money could not buy it."

Massachusetts Quail.

DANVERS, Mass., March 30.—Spring birds have arrived. An unusual large flight of woodcock is reported. Snipe have not made their appearance yet. We had a good winter for quail and many are left over, with good prospect for another fall. J. W. B.

SPORT IN THE NORTHWEST.

IN a few weeks New York city will be deserted, and from her miles of streets will have sent forth North, South, East and West thousands of men who will keep a fatherly eye on their rod and gun cases. To those bound for Maine and the Adirondacks I have no advice to offer. These grounds are tolerably well known, and if not quite all that is claimed for them they have at least the great advantage of being easily got at, and inexpensively too. My fancy, however, takes me further afield when I wander, and to those of the same way of thinking I tender the following brief notes on sport in northwestern Canada.

It is a somewhat serious undertaking this arranging matters for a trip into the wilderness—not a wilderness such as the Rangeleys and Adirondacks, where each camp bed has a spring mattress, but a vast stretch of uninhabited country, where you must take in what you require or go without it; so that it is perhaps just as well that the season begins late, and that, so far as the sportsman is concerned, nothing is to be gained by leaving New York before Aug. 1. To those that intend traveling merely for the scenery and change of climate these remarks do not apply; they will be perfectly happy in the Northwest Territories or British Columbia after June 15; and at such delightful spots as Banff in the Canadian National Park, or at Glacier House in the Selkirks, or at North Bend in the Frazer, they will find pleasant weather, lovely scenery and good fishing any time after June 15.

But the man who goes for sport alone should start about Aug. 1, and if he can make up a party he will be wise to hire a special car, the expense of which will not be more than $5 a head per day. This, when money is not an object, is to my mind the most delightful way in the world of enjoying sport. It beats a club house and preserve because at less expense you get equal comfort and greater variety. Supposing that such a party has been made up, the first stop might well be made at Jack Fish station on the Canadian Pacific Railroad, on the north shore of Lake Superior. Here the superb Steel River enters the lake, and the fishing in it is almost too good. Trout, true *fontinalis*, are often caught weighing 6lbs., and they take the fly freely in quick water. In this neighborhood there are many other streams equally good; for instance, the famous Nipigon is but a few miles further west; while the Jack Pine, Black River, Gravel River, Prairie River, and a host of little-known waters may be reached by short journeys east or west along the line. Mark my words: This is the coming fishing ground of the nation. These streams can never be fished out, as the trout have Lake Superior to fall back into, and even were the streams ruined there would still remain the unequaled fishing from the rocks of the lake shore. You can leave the cars at any point for 170 miles, put your rod together, and within a few yards of the track find all the fly-fishing you desire. To my eye the magnificent sweep of Jack Fish Bay, and the lonely beauty of the inlets and islands of the north shore, are as fine in their way as anything in the Rockies, and it is only thirty hours from Montreal.

For years it has been nothing but Nipigon; but unless I am much astray there are a dozen smaller rivers that will give equal sport. Mind, I am not decrying the Nipigon; far from it; but is it not true that a stream a man can wade, casting now right, now left, and catching therein a creel full of trout weighing from 2lbs. to 6lbs., is fully as sporting a proposition as a large river where you must canoe it all the time, with a couple of jabbering half-breeds to grate upon your enjoyment of the scene and sport?

There is more or less trout fishing all the way through to Manitoba, but the more becomes less as the prairie is reached. Pike, pickerel, doré and whitefish are the more common inhabitants of the charming lakes that stud that part of western Ontario. It is a better shooting than fishing country. The sportsman may shoot mallard by the hundred any time after Sept. 1, and after Oct. 1, 1900, he will be able to shoot all the moose and caribou any man should wish to shoot. I do not understand why the Ontario Government prohibited the shooting of those animals in that part of the province, as I believe moose are as plentiful to-day within fifty miles of Kalmar station as anywhere in America short of Alaska. There are some deer south and west of the C. P. R.R. line, but I do not believe they are particularly abundant, and I should recommend the visitor's confining his attention to the mallard, chicken and ruffed grouse. Until the railroad was built, sharptail grouse were never seen as far east as the present site of Rat Portage; now they have worked their way to Peninsular, nearly 500 miles to the eastward. The pinnated grouse, on the other hand, have pushed up from Uncle Sam's domains and invaded all southern Manitoba, edging out the shyer sharptail. The avifauna of a land often changes, thanks to man's advent.

Supposing the adventurous sportsman to have penetrated as far into the northwest as Rat Portage, 1,300 miles from Montreal, he will have to decide whether he will stay where he is, move on, or return homeward. Should he elect to go further, he will certainly not fare worse; though, until the antelope country bordering the south branch of the Saskatchewan is reached, there will be no change in the game found. Every slough and pond hole will contain young, unsophisticated mallard and teal, and the prairies swarm with sharptail.

The car may be sidetracked anywhere, and yet it will afford a base from which good shooting may be had. One piece of advice: be moderate; don't kill more than you can use. Some have done it, and their names are a stench in the nostrils of all good sportsmen. The northwest is big, and feathered game yet abundant; but should the game hog make it his playground, in time even that fine sporting region must fail.

From the Atlantic to the Rockies there is a familiar appearance about the vegetation and game; but once in the range and a new world is opened up. Trees, animals, birds, fish, all differ from those to which the Easterner has been accustomed. Nay, more, even the climate, with its soft, sensual airs, and mellow afternoon sun, is more like Asia than America. Although British Columbia is but 500 miles wide at the boundary line, there is a great diversity of scenery and climate, where, as in the 900 miles between Winnipeg and Banff, monotony is the keynote of it all; but a monotony of mallard and sharptail is not unendurable, after all, for some of us.

Let's "make believe" (as the little girls say when they're telling fairy stories) that our car has been dumped at Qu'Appelle or some such prairie station, and that we have had our fill of chicken and duck shooting, just as a month earlier we were surfeited with Lake Superior trout fishing. The date is Sept. 25, and a council of war is held in the smoking room of the car, or more likely out on the sun-dried prairie, with the grasshoppers 'oppin' around, and the little gophers watching us from the mouths of their burrows. To go on or to go back? The question is discussed pro and con until, being put to the vote, the "go ons" have it; and after seeing two malcontents off by the Eastern express at 20:20 that evening (*i. e.*, 8:20 P. M. civilized time) the car is hitched to the westward bound train at 6 o'clock next morning, and exactly twenty-four hours later is sidetracked at Banff. Everybody traveling over the C. P. R.R. stops at this famed spot, and many people become so enamored of the beauties of the place that they return year after year. Last summer I met several Indian officers and their families that had gone there in preference to spending their furloughs (leave) in England. It is a capital headquarters for information, as so many hunters of big game are coming and going that lots of points may be picked up as to where game is or is not at that particular time. Once in the mountains, big game may be got almost anywhere by hard work. No one lives there; it is still a lone land; and once over the ridge that separates the gorge down which the railroad runs from the next valley, you are as likely to find grizzlies, goats, sheep and deer as if you went 100 miles further into the unexplored. There are few elk and still fewer moose in the country between Banff and the boundary line; but goats, sheep and deer abound. Winter comes on early in the Rockies, and on account of the longer open season in the coast range I should advise the party whose fortunes we are supposed to be following to push on to Lytton on the Fraser, and hire an outfit for the Bridge River country. After three weeks in that region they ought to have some heads to show, and be ready to start for home and get to work again; but, of course, a visit to the coast and Puget Sound should be made before returning, or it will be a source of everlasting regret.

Those who make such a trip as I have outlined are almost certain to repeat it every year. I met last autumn several carloads of healthy, happy gunners and fishermen, who had been there before and intended returning in 1897, if all went well with them in the meantime. CHARLES A. BRAMBLE

Natural History.

FLORIDA PLUME BIRDS.

ST. AUGUSTINE, Fla., April 2.—*Editor Forest and Stream:* It is a hackneyed subject, but the only way to accomplish anything is to hammer away. A man who has just returned from a surveying trip across the Everglades informs me that a shameful state of things exists throughout that region, and that there is nothing to base a hope upon that the barbarous practices will be stopped until the race of plumaged birds is so nearly exterminated as to make the business unprofitable. He says that brutes with the semblance of white men make it their regular business to collect bird skins, and that laws are of no more consequence to them than to alligators. Before they took up the exterminating business the Indians were sensible enough to make and respect certain laws to prevent a decrease of birds, among which was an inviolable rule never to disturb them at their rookeries or roosts, and never to shoot them out of season. But the white men who have taken up the business lie in wait for them at the roosts, and when they are all in for the night they fire into the crowd, killing dozens at a shot. Then they look over the lot and probably select one out of five or ten and leave the rest of the dead to rot, and the wounded to flutter off and starve. This is in evidence that the difference between the poor Indian and the low-bred white is as great as between the edible qualities of a turkey and a buzzard. The Indians know that one of their sources of income is being destroyed, but what can they do to prevent it? In years gone by Florida was swarming with flamingoes, spoonbills, egrets and other beautiful plumaged birds, but they are nearly all numbered with the things that were.

Now the great question is in regard to the way by which this brutal bird butchery can be stopped. My own opinion is that the only way by which it can be done is through the enactment of a general law, with heavy penalties, to prevent all traffic in skins. These fellows work in a wild, unsettled region, where they can violate the laws without the slightest danger of detection; but with proper laws against the sale of skins their business would be ended, and these laws should also cover Brazilian and other foreign importations of birds for millinery purposes.

If women (who ought to be humane and tender-hearted) would give a thought to the fact that millions of the beautiful creatures are slaughtered every year, while other millions are left to starve in the nests, they certainly would be willing to sacrifice a little decoration for humanity's sake! The Brazilian Government derives a very large amount from export duty on bird skins, and the slaughter gives employment to hundreds of men who ought to be in better business.

If our legislators could only be waked up to face the fact that there is something in the world besides politics that is worth considering, we might hope that something would be done, but I confess that the case looks hopeless.

DIDYMUS.

ADIRONDACK WOLVES.

BIG MOOSE LAKE, N. Y., April 5.—*Editor Forest and Stream:* I see under date of April 3 you publish a clipping from a Watertown paper relating a thrilling adventure of one Charles Adams with a dozen wolves. That story may sound all right to people who know little or nothing about the Adirondacks, but those who have spent their lives in the Adirondacks know that it is not true. I live within a few miles of Woodhull Lake, where the encounter is said to have taken place, and we are connected with Woodhull Lake by telephone, and I have not heard of the encounter.

Such a thing might have happened thirty or thirty-five years ago, when I first began hunting and trapping in this section. In those days it was nothing unusual to hear wolves howl every day, for they were plenty, and occasionally see a band of them in winter on the ice on some lake, for the deer when pursued by wolves would run out on the ice to get away from the wolves. That part of the Adams story looks quite reasonable I have known as high as a dozen wolves to be out in one band on a lake, although I have never seen but three together, even in the early days, when wolves were plenty.

I have often talked with old guides, who had remarked the same thing that I have, *i. e.*, the wolves almost invariably catch the deer within a few rods from the shore after he starts out on the ice, even when it was more favorable running for the deer than for the wolves. It puzzled me for a

long time to know how they did that. I finally settled the question to my entire satisfaction. The wolves instinctively seem to know the runways, and a part of the band would cut across a nearer way to the runway on the lake and intercept the deer. I have seen wolves station themselves out on the ice and wait for the deer to come. Such things were common at one time, but for the last twenty years wolves have been too scarce for any one who lives in this section to believe the Adams story, although I think there may be a dozen wolves left in the Adirondacks.

I have been in the Adirondacks every winter more or less for thirty years, and have tramped through some portion of it in Herkimer and Hamilton counties on snowshoes, but I have not seen a wolf track in eight years. H. S. J., from Clayton, wants to know when the last wolf was killed. In 1888 or '89 the writer and Fred Hess, a well-known guide, killed a large wolf on the head of Fourth Lake, Fulton Chain. He had come out on the ice about forty rods and lain down in the snow to await the arrival of another wolf that was after a deer. We saw him and went out and killed him That was one of the last. The very last was killed at Brandith Lake in 1894, about ten miles from here, by Reuben Carey, the Brandith's game keeper. I think the bounty certificates will show the same. I have not heard of a wolf's track being seen since.

We had moose at one time, and panthers not many years ago. I remember one moose my father killed. When I was a boy panthers were plenty; they are all gone and the wolves are nearly gone—too nearly gone to attack any one in a band of a dozen.

J. H. Higby.

BIRD PROTECTION.

The recently organized State Audubon Society has issued the following circular, which explains itself:

Attention is called to the fact that the fashion of wearing feathers for ornament causes the destruction of millions of birds each year, and is rapidly lessening their numbers.

Birds are the natural protectors of vegetation against the attacks of insects; in this way their utility is beyond estimate. They are endowed with beauty, the gift of song, wonderful instincts, and a high order of intelligence, and display a vivacity that places them among the most fascinating of nature's creatures. They thus appeal to our esthetic sense as well as to our economic interests.

Already our song birds have greatly decreased in numbers; while the beautiful egrets and snowy herons, and the graceful terns, once so abundant, have become almost exterminated. What is the cause? At least nine-tenths of this destruction is due to the habit of wearing dead birds, or parts of them, for ornament.

The remedy is in the hands of women; if they will refuse to wear the feathers of wild birds the destruction will cease—but never until then.

The wearing of aigrettes is especially to be condemned, since they can be procured only through the destruction of the parent birds in the nesting season, which entails death by starvation of the helpless young in the nests. In our own country we have few egrets left to protect, but the war is still carried on in other countries, and will be waged until these beautiful birds are practically exterminated the world over, unless the use of aigrettes is abandoned.

This Society appeals to women to refrain entirely from the use of aigrettes, and the wings and feathers of all wild birds; and to intelligent and humane men to secure in every way possible the protection and preservation of our native birds. We appeal also to teachers to use their influence to interest and instruct their pupils as to the usefulness of birds, and to stimulate their love and admiration for these fellow creatures.

Believing that it is only necessary to call your attention to this important matter to secure your coöperation in so good a cause, we trust that you will not only become a member of this Society, but will use your influence to enlist others as helpers in the work.

Declaration of Principles.

First—The purpose of the Society is to discourage the purchase or use of the feathers of any birds for ornamentation, except those of the ostrich and domesticated fowl.

Second—Members shall discourage the destruction of birds and their eggs, and do all in their power to protect them.

Third—Members shall use their influence to establish "Bird Day" in the schools of the State of New York.

Fees.

A fee of $1 shall constitute a life membership in this Society, except for teachers and scholars in any of the schools of the State of New York, who shall pay 25 cents for a life membership.

There is no annual assessment. A certificate of membership will be sent upon receipt of the inclosed card, signed with your name and address, and the membership fee. The fees are devoted to the work of the Society, which includes free distribution of circulars and reports relating to bird protection. Address: Miss Emma H. Lockwood, Secretary-Treasurer, 243 West Seventy-fifth street, New York.

The Plumage of Hesperornis.

As long ago as 1870 Prof. Marsh, of New Haven, discovered in the cretaceous chalk of Kansas the remains of a large swimming bird which had teeth. Subsequently other specimens of this bird, some of them extremely perfect, were discovered, and Prof. Marsh described them under the name *Hesperornis*. These, together with a number of other forms of birds having teeth, were fully described and figured by Prof. Marsh in a monograph on Birds with Teeth, which was published in 1880.

This large bird, *Hesperornis*, resembled in many respects the loons of to-day; that is to say, it was a swimming bird with a long neck and pointed bill, and with greatly developed legs. But it was wingless, and the sternum, or breast bone, was absolutely smooth and without the keel which is characteristic of all flying birds, and to which the pectoral muscles are attached. The only bone remaining in the wing of *Hesperornis* was the humerus or bone of the upper arm

In his discussion of the relationships of *Hesperornis*, published in the volume referred to, Prof. Marsh considered these diverse characters, and concluded by expressing the opinion that the hind limbs, which so strongly resemble those of the loons, were adaptive merely, and that the bird's nearest relationships were to the ostriches, which it so closely resembles in its breast bone, in the bones of the shoulder to which the wing bones are attached and in some of the characters of the skull. Thus, in his opinion, *Hesperornis* was a carnivorous swimming ostrich.

This view of the relationships of the great bird did not meet with general acceptance. The characters of the hind limbs seemed to be much more impressive than the ostrich-like characters of the sternum, shoulder girdle and skull, and many authors spoke of *Hesperornis* as related to the loons.

It is interesting to learn, as stated by Prof. Marsh in an article in the last number of the *American Journal of Science*, that in the same region where the early specimens were discovered another remarkably perfect *Hesperornis* has been found with feathers in place, and that these feathers show the typical plumage of an ostrich. Thus Prof. Marsh's earlier conclusions have received strong confirmation.

Carnivorous Squirrels.

We have here a character who among other singularities has large imaginative powers, but whose reputation for strict veracity might be hazarded without an affidavit. He lays his claim to being something of a sportsman, as having some years ago done the part of a peripatetic vender of cheap guns among the mountaineers of western Pennsylvania.

In a recent talk with our brother clubman and all-round sportsman, Dr. P. W. Levering, the question of squirrel shooting came up, when our friend (the peripatetic) told of an extraordinary time he had had with the bushy tails. The scene is laid in Pennsylvania, about seven miles from Williamsport, some twenty-five years ago. He told Levering that in two hours he killed seventy-eight gray and black squirrels with a muzzleloader. That it was in a corner of a pasture close to woods where the squirrels came in on two lines of rail fence to feed on the carcass of a dead horse.

This was too much for Jacobstaff, so he interviewed the peripatetic with the following result. In all seriousness he informed us that it was 105 gray, black and a large kind of red squirrel that he killed in that time; that the nut crop and the corn crop in that region had utterly failed, and that the squirrels were almost famished and would eat anything. I remarked that I did not see how they could very well, as squirrels' teeth are designed for an exclusive granivorous diet, and didn't believe them well adapted as flesh masticators. He sticks to his story and says he can bring proof of the facts, time and occasion.

The foregoing is about on a par with a story Doc Cummins, also one of the reliable shots of the J. C. H. G. Club, tells of a friend of his that bagged (so his friend says, not the Doctor) twenty-seven woodcock down in the swamp back of the house one afternoon with a Flobert rifle; no dog.

Jacobstaff.

[But squirrels are known to be carnivorous on occasion.]

Dakota Rabbit Traps.

Many of the Russian farmers west of town are complaining about jack rabbits falling down their chimneys and frequently lodging therein, stopping the passage of the smoke. Their peasantlike houses—which are all provided with large fireplaces and proportionately large chimneys—are mostly low and covered with the "beautiful." The chimneys, of course, have to be kept clear of snow. After it has been shoveled away several times, a large funnel-shaped cone remains, the walls of which are rendered icy by the alternate influence of the fire below and the cold above. Any wild animal prowling around on a bitter cold night, upon nearing one of these smoke cones and feeling the warmth, would naturally seek closer proximity thereto, whereupon its ventures would invariably result in a slide, Mr. Animal landing in the fire-box below.—*Kulm (N. D.) Wind.*

Doom of Two Pugnacious Robins.

Windsor, N. C., April 5.—It is not a very unusual occurrence for quail to kill themselves by flying against a house or other obstruction when frightened, as I have known of at least a dozen killed in this manner in the last ten or fifteen years. Not very long since one killed itself against my office window. However, I started out to tell not about quail, but robins. Early last Wednesday morning two male robins flew against a house and were picked up by my hired man, one perfectly dead and the other very near it. They were fighting, and were so busily engaged no doubt that they did not have time to look out for houses and such small things.

A. S. R.

Game Bag and Gun.

THE SCHOOLHOUSE COVER.—I.

Among the many favorite haunts of the woodcock that it has been my good fortune to explore none take higher rank than a sequestered nook nestled among the Berkshire Hills, known to a select few as the "schoolhouse cover."

I first visited the romantic spot early in the sixties in company with a veteran sportsman who for several years had made numerous visits each season to the place, always returning with a good supply of the feathered dainties and an increased love for the favored spot. The cover, or rather succession of covers, is delightfully situated just under the brow of one of the numberless Berkshire Hills, and consisted of patches of alders, birch-covered knolls and an old orchard, partly grown up with witch-hazel and briers. Just below the orchard, in the angle where two roads joined, was the little brown schoolhouse that suggested the name by which the locality was known to the elect.

It was a bright morning in early October when, at the invitation of my friend the veteran, I accompanied him to the place. When we arrived at the schoolhouse it was almost 9 o'clock, and nearly two score of bright-eyed, rosy-cheeked lads and lasses at once surrounded us, and with merry voices gave us a most cordial greeting. The evident delight of the children was a mystery to me until the veteran brought out from under the wagon seat a box that contained nearly a half peck of candy and placed it for distribution in the hands of one of the older ones. This, he said, was to pay them for taking care of the team, a charge which they attended to in the best manner, and we always felt perfectly safe in leaving the horse in their care.

Starting up the road toward the old orchard, we soon came to a steep bank some 20ft. in height, covered with alders and maples, and just at the foot of the bank was a level piece of ground that was also grown up to alders, making a strip of beautiful cover some twenty rods in length. In order to save time, as we wished to go over all the cover, my companion directed me to go to the right while he beat out the opposite end. Sending on my dog, he took a few strides and came to a point just at the edge of a green grass plot that was bordered with graceful ferns, and as I walked in ahead of him I was greeted with the querulous whistle of a noble woodcock that I cut down as he topped the alders. This was the first of a long list of these royal birds that, first and last, I have bagged in this ideal spot, known to all who visited here as the "woodcock's parlor," and a surer place to find one or two birds I never saw. Indeed it was many years before I failed to find the parlor without at least one occupant, although I visited the place several times each season. In fact, the whole of these extensive grounds was noted for the celerity with which other birds came in to take the place of those that were killed, and it was frequently the case that a party would shoot over the grounds, bringing to bag all, or nearly all, the birds they found, and another party the next day would find the same abundance. Upon one occasion I knew of three different parties shooting over this ground upon three consecutive days, and all of them reported capital sport and lots of birds.

After working out the alder strip I have mentioned, we climb the bank and beat through the orchard, which lies just at its upper edge. Here, among the patches of witch-hazel, was also a sure place to find three or four birds, and occasionally a full dozen would be found. East and north of the orchard were scattered trees and some dense patches of birches that often held a few birds, while still further north was quite an extent of scattered clumps of birches that looked very inviting, but, with the exception of three or four favored spots, no birds, to my knowledge, were ever found here, although it was worked out thoroughly a great many times both by myself and others. After beating out the orchard the usual course was to cross the road to the left, then go down the slope to a swampy piece of ground that was sparsely grown up to maples, with an occasional clump of alders. Although no woodcock shooter would ever think of looking here for his favorite bird, it was one of the best and surest places to find them in the whole region. I well remember that upon my first visit here I chaffed the veteran for proposing to beat out so unlikely looking cover, but he only smiled and sent on his dog, and I was soon convinced that there was at least a brace of the beauties here, and when we had gone through it I was thoroughly convinced that appearances are sometimes very deceptive when you are looking for woodcock.

We had brought to bag some eleven birds, and three years later with the same companion we found no less than seventeen in this small patch of not more than three acres It was here that the late Hon. George Ashmun covered himself and the Roper four-shot repeater with glory by handsomely bringing down in four seconds four birds that he flushed from one point.

Beyond this spot, and covering more than 100 acres, is a succession of birch-covered knolls interspersed with small alder runs that was always, in the good old days, a famous place for both woodcock and grouse; and there is scarcely a square yard of the whole ground that has not furnished its quota of sport. At the end of this cover we come to open pasture, which we cross to the birches on the opposite side. These we pass through, down a steep slope to the little brook, when we turn to the left and follow up the brook to the road, some half mile above, coming out only a few rods below the schoolhouse. This last run was a capital place for grouse and occasionally a few woodcock would be found. When we had the time to spare, we would cross the road and beat up the thicket beyond for grouse, which were nearly always plentiful there, although the dense growth of brush and briers made it a hard place to work both for man and dog.

This was the schoolhouse cover in the good old days. What thronging memories of rarest sport come to me as in fancy I revisit the dear old spot. Familiar forms of dearly loved companions, many of them long ago translated to the happy hunting grounds, in fancy again tread with me the springy turf. Once more I see the soaring woodcock deftly brought back to earth again by their unerring aim Again I see the arrowy flight of the "hurtling grouse" suddenly cease as eye of faith and finger of instinct have proven more than a match for crafty cunning and wondrous speed. Once more old Mack and Trump, and a score of other well-remembered forms, are gayly bounding before me over the beautiful knolls and through the lovely valleys of the dear old place. What hosts of wonderful living statues gladden my eyes as they glance over the many favored spots that woodcock and grouse loved so well. In the silent watches of the night, when worldly cares have banished sleep, blessed visions of bygone days of rarest sport often come to cheer my saddened heart and bear me upon their widespread wings to happiness and peace. Visions of many, very many, widely separated resorts, and memories of many, very many, glorious days afield thus come to me; but none take higher rank, and but few can equal the beautiful surroundings and happy days of the dearly loved schoolhouse cover.

One of the best days that I ever enjoyed here was in early October, just after two or three heavy frosts. In company with the veteran and our mutual friend Sabin, we took an early start and arrived at the schoolhouse about 8 o'clock. Hitching our horse, we took our guns from the wagon and proceeded to load them—this was in muzzleloader days—the veteran walked a few steps away, and just as he was about to ground arms a grouse with a tremendous roar and racket started nearly under his feet and flew toward the run across the road. Now the veteran was one of the coolest men under fire that I ever met, but he was a bit rattled this time, for he whirled completely around, and as he caught sight of the bird he deliberately drew a bead on him and pulled trigger. It was very seldom that we had the laugh on the veteran and I assure you we fully enjoyed the opportunity, and when Sabin in a severe tone asked him if he didn't know it was loaded he heartily joined in our mirth.

After we had steadied down we loaded up and returning ramrod started for the old orchard, but after taking a few steps the veteran, bidding us go on, turned on his heel and started for that bird. "I'll show him what's what," said he, and he soon disappeared over the wall Sabin and I had just entered the alder strip under the bank when we heard from the veteran, both barrels in quick succession. Sabin shook his head and remarked that in such cases the result was usually most unsatisfactory, but I had unlimited faith in the veteran and offered to back the gun, and as soon as I caught a glimpse of him coming up the road I knew by the way he carried himself that all was well with him. When he joined us and pulled from his pockets a brace of the royal birds, even Sabin was convinced that there were exceptions to this rule when our friend was behind the gun.

Beating out the strip, we found in the parlor a brace of woodcock, which gave the veteran a very pretty double, and at the far end Sabin stopped a twisting bird in capital style. As we neared the top of the bank an evil-disposed bird flushed not 3ft. in front of me and started down the bank, almost brushing my legs as he passed me. I whirled around, and

catching my foot began to tumble; but as I was going I caught a glimpse of the bird as he was disappearing behind a thick bunch of alders, and threw the gun where I thought he ought to be and cut loose, and woodcock and I struck the ground at about the same time, both in rather a demoralized condition. I was feeling rather badly, as I had made quite an exhibition of myself, to say nothing of bruised shins; but as I gathered myself together pain and chagrin disappeared under the hearty clap on the shoulder by the veteran as he exclaimed, "I thought both my doubles very neat, and I felt proud of them; but I would give them and half a dozen more for a shot like that."

There was only one woodcock in the orchard which fell to Sabin. Listen to his story of the affair, as he has told it many times: "I flushed the bird in front of Trump and killed it, and in falling it lodged in the top of an apple tree that was more than 2ft. through at the butt. The old dog looked at it a moment, then with a wag of his tail he deliberately climbed the tree, shook off the bird, then came down, picked it up and brought it in." True every word of it, as we all witnessed the performance. Although Sabin never adds another word, it may be as well perhaps for me to say that the tree had been blown nearly down, and laid at an angle of about forty-five degrees, which made the feat comparatively easy for a dog with the sense possessed by old Trump. When Sabin went to put the bird in his pocket, somehow he made a misfire, and it dropped on the ground unnoticed by him, and as he started along I picked up the bird, and, showing it to the veteran, put it in my pocket and said nothing.

We then beat out the birches just beyond the orchard, where we found two birds, both of them coming my way. In the ground still further on we visited the good places, but there was only one bird here, which the veteran accounted for; at least he thought he did; but as I had fired both barrels at it there was room for doubt I said nothing, however, as I very much dislike to mar the enjoyment of a companion when he appears to think he has "wiped my eyes;" in fact, this performance never disturbs me in the least. I have no reputation to maintain as a sure shot. I dearly love to shoot, and am pretty nearly sure to cut loose if there appears to be the remotest chance of getting the bird, and I often pull the trigger by guess when the game is entirely hidden from sight. The pleasure of shooting far outweighs the loss of the ammunition, and I always consider myself ahead in the game even if I do sometimes pile up the misses; and then when one does make a long or difficult shot there is lots of compensation for previous failures, to say nothing of laying up treasure in memory's storehouse that will increase and multiply as the years go on, no matter how much or how often you may draw upon it. Why? I would not barter the memory of one such shot of the many that have fallen to my lot for tenfold the satisfaction enjoyed by him who never misses his bird.

Crossing the road to the maple swamp that I have previously mentioned, as we walked down the slope, I kept a straight course, while Sabin diverged a little to the right and the veteran to the left, which brought us to the swamp about 30yds. apart. Sending on the dogs, all three of them pointed at nearly the same instant, and after admiring the beautiful picture for a short time the veteran gave the signal to advance. When we went to the dogs almost simultaneously each of us put up a bird and there was not three seconds difference in the report of the three guns, all of the birds being accounted for. "There," exclaimed the veteran, "I never saw nor heard of anything like this before, and do not believe that I shall ever see it again." It was indeed a wonderful performance for our rough New England shooting. Although I have several times seen three and four birds killed almost simultaneously, I have never since seen it done from three independent points. We found four more birds here, two of them falling to the veteran's gun and two to mine, although Sabin should have had one of these; but he was a sure shot and thought too much of his reputation to take chances, and as I saw him lower his gun, refusing the shot, I cut loose at the corkscrew and had the satisfaction of bringing it down.

After leaving the maple swamp we beat out a birch knoll and the little alder run beyond it without a find. Just as we reached the top of the bank at the head of the run a woodcock flushed wild some 50yds. in front of us, and taking a circle of about 200yds. in diameter it settled squarely behind us in the run that we had just passed through. Sabin was delegated to bring it in, and he at once started for the bird, sending his dog around to the right in order to give him the wind. When he arrived within about 20yds. of the bird it arose and Sabin killed it very prettily just as it was disappearing behind a clump of birches. At the instant he fired a cuckoo about halfway between him and the woodcock started into the air just in time to catch a portion of the charge, and it also fell dead; but Sabin knew nothing of this, and as his dog came in at the report of the gun he ordered him to fetch dead. Old Trump went in the right direction, and when he came to the cuckoo he picked it up and brought it in. You should have seen the look on that man's face as he took the bird from the dog. The veteran and I were almost in convulsions—in fact the veteran did go down all in a heap when Sabin came up and solemnly averred that that bird had whistled just like a woodcock. The fun of this was that Sabin had an impediment in his hearing, and often said that he had not heard a woodcock whistle for years; but we decided that as an excuse for shooting the whistle was first class.

While recovering from the turn this performance had given us, I saw by the actions of my dog that he had marked the dead bird, so I silently motioned him on, and he was soon galloping back with it in his mouth. When Sabin caught sight of him he at once grasped the situation, and it was worth almost as much as the rest of it to see the changes come over his countenance as he turned to us and remarked: "Pretty good joke on old Trump, wasn't it?"

When we resumed our course the veteran's dog was missing. "Never mind," said the old man, "he knows the route and we shall soon find him if there are any birds" Sure enough, we soon saw him at the edge of a patch of birches fast on point. As we came to him the veteran walked in front to put up the bird. He had advanced three or four steps beyond the dog when, with a yell, he jumped 3ft in the air, then scrambling back he tumbled over poor Joe and both went down together. Wondering what was the matter, Sabin and I hastened to him, and as he gathered himself together he very energetically ejaculated, "Holy Moses! what a snake." It appeared that he had stepped squarely on the biggest snake he ever saw, hence the yell and quickly following evolutions. Joe meantime had picked himself up and resumed his point, which the veteran bade us attend to, he did not think that he could hit a barn. As I stepped to the front I saw the grass and bushes moving a short distance ahead and cut loose at the disturbance. At the crack of the gun a woodcock flushed just beyond and flew nearly over the veteran's head. This brought him round all right, at least he grassed his bird in good style. We then investigated and found that my aim had been true, as the snake was writhing near by with a broken back. When we saw him we not only exonerated the veteran for his part of the performance, but soundly rated him for not yelling louder and jumping higher; the tumble over the dog we decided was faultless.

It was now past noon and high time for lunch, so we obliqued to the right and made for a cool spring under a maple some fifty rods distant, where we spent a most agreeable half hour discussing our lunch and reviewing incidents of the morning.

Ah! that cool, inviting spring; how many happy half hours have I passed under the noble tree that shades the sparkling waters; how many loved companions have shared with me the delights of this sylvan spot; how many well-told tales of sport galore have I listened to here; how many noble birds with their plumage all smoothed out have I seen lying side by side on the evergreen turf; what delightful "smoke talks" come to me as my thoughts go back to the good old times! SHADOW.

THE "RICH" AND THE "POOR."

Editor Forest and Stream:

The communication of Mr. W. W. McCain entitled "The Pennsylvania Game Law," and published in FOREST AND STREAM of April 10, is similar to a few others which appear now and then at infrequent periods, and which represent nothing more than the peculiar idiosyncrasies of individual grumblers, whose ideas of economics are awry, or who mistake their extremely acute personal cupidity for the true measure of justice. Their keynote is the injustice done to the poor man by the rich. They proclaim their personal vaporings to be general just principles. They arrogate to themselves the authority to speak as the true representative of the poor man. I do not believe that they are such. I do not believe that they proclaim the sentiments of the poor man. I do not believe that the poor men of this country (that is, the meritorious poor men, those who are industrious, intelligent and progressive) believe that there is an antagonism and opposition of interests between the rich and poor. Out of the army of contributors to FOREST AND STREAM, I am pleased to note that such opinions do not come from the best writers or thinkers, be they rich or poor. Men of influence, of high position, of good standing in the community, men who know what belongs to themselves as men, and what is due their fellow men as citizens, men who are earnest in promoting the public good, never hold such views. There are, however, a few men whose contribution to the sum total of social and financial progress consists of inveighing against existing conditions, and they even flourish so far as to organize into bodies, whereupon their scattered ideas crystallize into a fantastic whole; thus we have Coxey armies, anarchistic gatherings, etc., with a few blatant demagogues as leaders, who declaim against the monster, wealth—a monster which they soon get on very good terms with if they can but capture it.

It is a vicious doctrine indeed which teaches that there exists an antagonism between the rich and the poor. On the contrary, their interests are common interests. Their life in society and its affairs is so interwoven that there can be no antagonism without each suffering a common injury. Wealth and labor are inseparable. Where there is wealth there necessarily must be labor, for wealth owes its existence to labor. To capital and labor we owe the wonderful development of this country. They built our vast railroad systems, canals, bridges, shipping, cities, roads, telegraphs, etc., and the millions of dollars expended went into the hands of the poor, as millions still continue to go into their hands for services rendered as employees Under the laws all are equal.

Rich and poor are but relative terms. Few men are so poor that they will not find others who are poorer, and few are so rich that they will not find others who are richer. Of the rich, many acquired their wealth by years of industry, self-denial, special training, and an aptitude for business. The same road is open to all. Many men are poor from indolence, or extravagance, or inefficiency in business. Yet envy only comes when a comparison is made with the better fortune of others. No doubt Mr McCain, whatever his fortune may be, knows of many people poorer than he is himself; but knowing such men, does he deny himself the comforts or pleasures within his means because of that? I dare say that he is not interested in bringing himself down to the level of those poorer than himself. He enjoys his own, as is his right. Human nature is the same through all the different gradations of wealth, and each one enjoys for himself according to his fancy and his means.

I have nothing whatever to do with the argument between Mr. McCain and Mr. Mazurie and Bon Ami. I take the points presented by him as being bad in themselves, entirely regardless of any application which he makes of them.

He asks with much earnestness the following question:

"Which is the better sportsman and the more considerate, consistent game protector—the poor pot-hunter (?) who legally kills 100 ducks, grouse or woodcock in a whole season's shooting, and from sheer necessity sells them to supply his family with the necessaries of life, or the wealthy club member or yacht owner who kills five times as many in a morning's shoot and gives them to his friends and companions?"

Truly the answer is easy—the club member and the yacht owner are the better sportsmen. And why? Because the man who goes forth with no other motive than to kill for market is no sportsman at all, nor does he care a rap for the features of sport. He snares, pot-shoots, shoots out of season, and secures the birds any way he can. He is out for money. To call him a sportsman is to force the term upon him. Mr. McCain's statement of the question is as unfair as his weak case demands; first, because no wealthy club member or yacht owner ever killed 500 ducks in a morning, and it is a rare occurrence when he kills so many as that in a whole season. Second, for every successful hunt enjoyed by a club member he has had a dozen or more which were unsuccessful. Of "club members" or "yacht owners," not more than 10 per cent. have successful outings so far as the mere killing of game is concerned. Wherever they go they give a liberal return in money paid for services or material.

And alas! the poor pot-hunter who kills only 100 birds in a season. Poor, poor man! Let us pause to pity him Let us unite our voices and call him gentleman; yes, sportsman! Let us make a wreath of laurels for him. He has been maligned and despised these many years, the abhorred of all true sportsmen. How solicitous he is that he kills his birds legally! And his moderation! Gentlemen, we have done the pot-hunter a great injustice. Let us henceforth denounce the sportsman and exalt the pot-hunter. Let us do this that our game may be preserved. Let us do this that we may learn true sportsmanship. Let us do this that we may scorn riches and the pleasures that they bring. But before we do all this let us confer over it.

Where does the enormous market supply of American game come from?

Who has swept almost from existence the prairie chicken, which once was found from the Gulf of Mexico to the regions of British America? The "club member" and "yacht owner"?

Who exterminated the wild pigeon, whose numbers in flight darkened the sky? The "club member" and "yacht owner"?

We now have a fragmentary flight of ducks. A few years ago every slough, stream, lake and marsh was full of them as they made their way southward in the fall, and later the bays and coasts of the salt water were filled with them. We have a few ducks left. What has become of the rest? The "club member" and "yacht owner" again?

Market-shooting as a vocation was one of the most profitable. It is profitable yet to those who have a knowledge of the best manner of conducting it No greater ignorance was ever displayed of what was fitting than that shown by Mr. McCain in asking us to feel sympathy for the poor market shooter who is struggling to earn a meager living for a poor and needy family. It is a picture drawn from vaporing sentiment or personal interest, and not from fact. There may be market-shooters in certain poorly favored sections who do not make any great sums of money, but the shooter who has the physical ability to travel through field and cover all day, and has the practice to handle a gun skillfully, has sufficient intelligence and physical strength to earn a living in some other manner. Once a man is a market-hunter, he remains one so long as the game lasts or until the law prevents. The occupation is followed for the profit that is in it and for the freedom which goes with it. In the Western chicken country a few years ago—with a cheap horse, a cheap wagon and a cheap gun, with a dog or two to assist, the whole outfit costing from $100 to $150 - it was not an unusual occurrence for a market-shooter to kill from six to ten dozen chickens in a day, and they averaged about $3 per dozen, or from $18 to $30 for a day's work. Alas! poor fellow trying to support a family. The season opened in early August and lasted into winter. A man afoot could make from $6 to $12 per day. Market-shooters swarmed there from all the different States, and some of the resident farmers abandoned farming during the chicken season to shoot for the market, finding this more profitable than their regular vocation. When cold weather set in and ended the chicken shooting the duck season began, and the true market-hunter followed the ducks all the way south, killing all that he could, and then shot all winter on the coast, following them back in the spring. As he in the good years gone by could kill anywhere from 50 to 150 ducks or more in a day, it is easily seen how the poor fellow was deserving of heartfelt sympathy for struggling so hard to "supply his family with the necessaries of life" on $20 or $30 a day. The market-shooters have decreased because they have destroyed the birds. Some of them found that there were not birds enough for them to continue their model "sportsmanship," though there are market-shooters yet who follow the birds north to south, shoot all winter on the southern coast and follow them back again in the spring. There are also market-shooters who are engaged on a regular monthly salary. There are hundreds of such engaged every season. They are paid good wages, not, however, for merely killing 100 birds in a season. This discussion is not a question of a few impecunious men making a living. It is a question of an army of expert market-shooters destroying the game of the nation.

To further present something more tangible than mere assertion, I consulted my scrap book, in which I preserve all matters I deem of value and interest. In it I find the following, from FOREST AND STREAM of Jan 5, 1895. It was written by a staff correspondent of this journal. He wrote from New Orleans:

"No section of country can preserve its game supply if it is systematically worked by market-hunters. Few sportsmen realize the enormous destruction of game which is constantly in progress to supply the demands of the market. Forty or fifty birds each day to one gun do not seem to be a destructive quantity, but it amounts to an enormous total in four or five months. When there are several guns in one neighborhood used in market-shooting, such shooting must result in the destruction of the game in that section. The western part of the State (Louisiana), I have been informed, is losing its game birds rapidly from this cause. Market-shooting is in progress there on an extensive scale, and not the old-time style of shooting, wherein the shooter relied on his individual effort, and carried his modest bag to the nearest dealer to sell for such sum as he could get, but organized shooting with modern equipments. The shooters scour the surrounding country, killing all the birds that they possibly can. A wagon is engaged to visit certain prearranged points at stated times to collect the birds killed and take them to the town in which is the shooters' headquarters. The birds are put in a refrigerator box made for the purpose, and when 1,000lbs. are collected they are shipped in the refrigerator to New York. I was told that the shooters netted from $1,000 to $5,000 per year from their work in market-shooting."

In a letter dated New Orleans, Dec. 22, 1894, he wrote:

"No one in the North who has not given the subject special study realizes the enormous quantities of game killed in the South during the winter months. Hundreds of men are employed on a salary to shoot for the market by business firms of New Orleans. One dealer told me that he had bought, at one order, $850 worth of ammunition to distribute among his 150 market-shooters, etc. * * * One gentleman, whose knowledge and veracity are above question, assured me that in past years he has known of upward of 100 baskets of ducks to be shipped from one point in that section, and as each basket averages about 100 ducks, the total is almost incredible. Another gentleman told me of a big day, wherein one man shipped as the result of three or four guns' work a total of 5,700 ducks."

These are statistics from but one or two localities. There are many such now from New Orleans west to old Mexico. The refrigerator and fast transportation make market shooting an occupation of certain profit. The poor market-shooter who "from sheer necessity sells them to supply his family with the necessaries of life" seems to be really an army of able bodied, skillful men following shooting as a regular profession, each one killing thousands of birds each season, and either receiving good salaries (not, however, to him "who legally kills 100 ducks, grouse or woodcock," as set forth by Mr. McCain, whose experience as a merchant dealer in game should qualify him as an authority on sport) or making sums which in amount rival the incomes of professional men.

The markets in all the large cities are filled with an abundance of game every season and for some days after the season is closed. All the hotels, cafés, restaurants, steamships, etc., numbering thousands, are able to supply their guests with any variety of game in season and some out of season There is enough to supply private needs also. The enormou[s]

cold storage warehouses carry in the aggregate millions of birds for use in the close season and for the private use of their customers at all times. Note the Chicago cold storage case, which is not so long ago as to be out of memory. The game warden found 27 000 birds stored away in Kewanee in summer, and that warehouse was but one of several in Chicago, and those in Chicago are but a few as compared to the total number in the United States. And who furnishes the vast supply for the consumption of 70,000,000 of people, or such percentage of it as can afford to eat it? And out of the total number the percentage must be very great. Of course, it is the "club member" and the "yacht owner."

As the FOREST AND STREAM has often pointed out, our American game laws are for the benefit of rich and poor alike. Law is more for the benefit of the poor man than it is for the rich, for the latter can have his shooting whether there is any law or not; that is to say, he can travel into the wilderness and find sport in the unsettled sections, or he can establish a preserve of his own. When a poor man decries the passage of game laws he is fighting his own interests; for he is the greatest beneficiary of them. The rich man is but a demagogue's bugaboo at the most, for by far the greatest number of shooters are men of moderate means.

Mr. McCain writes as follows: "The fortunate class, who can enjoy shooting privileges at their pleasure, who invest small fortunes in club membership and shooting preserves, are continually deriding the poor and less fortunate class of gunners, who from grim necessity must occupy a lower sphere." I deny this in toto. The whole is based on false assertions, a narrow and ungenerous imagination, commercial interests, and a selfishness which is paramount to all considerations of what is just to others.

WILLIAM HENRY ATHERTON.

THE PENNSYLVANIA GAME LAW.

HARRISBURG, Pa., April 10.—*Editor Forest and Stream:* The article appearing in your last issue, opposing the enactment of the Baldwin bill, is as misleading and evasive as all previous articles have been on this subject. I fail to find a direct answer to any section of the reasons given for its enactment. Drawing upon the imagination to paint a pen picture of prejudice and fiction is not argument, but is contrary to the provisions of every section of the act, creating as well as defining the duties of the proposed officers.

It can have but one object, that to excite public animosity against the proposed officer acting as chief by misrepresentation. The answer to all such imputations, as well as all the pretexts advanced, can be found in the facts and figures taken from the report of the State Game and Fish Warden of the State of Michigan, and contained in section 8 of the article of explanation.

Fortunately the provisions of the Baldwin Act are such as to define the duties of the chief and his subordinates, and gives them the power and authority to act with promptness in all cases of violation, and thus balk the opportunity for the violator to remove the evidences of guilt

Impossible as it may appear to some, it will not require more than $6,000 per annum, as a State appropriation, to properly patrol this Commonwealth for fish and game violations. The facts contained in the reports of the operations of this act in another State have convinced me that the sum named is adequate, and if certain sections of the codified game and fish laws are enacted, and the Baldwin Act passed, it will be abundant, and no part of the State will suffer the extent of ills to which it has been subjected in the past by violations.

The objector is evidently ignorant of the fact that the system which he proposes is the same old inoperative one which has been carried on in this State for the past ten years by the Board of Fish Commissioners. It has never been a success or abated violations, and they are to-day as common as though there was no appropriation for this purpose.

I would recommend that the opponent first read the article and the Baldwin bill. Inform himself as to the provisions of the general fish and game bills now before the Legislature, what has been appropriated in the past, its purpose and results; also secure and examine the protective systems now in operation in other States, and feel sure that he will find less time for the occupancy of downy chairs for the chief warden, and to criticise the supporters of this practical act.

In this conection I desire so make a statement, based on facts, that the sole purpose of this act is to protect the game and fish reserve of the Commonwealth of Pennsylvania, controlled by its individuals and citizens, an organization composed of all its people, Delaware, Dauphin, and Erie counties alike, as well as all others within its wide domain.

The imputation that Mr. Worden had conspired to assist a measure for the special benefit of some certain reserve is a gross injustice to him. I have known him personally for twenty years, positively know that he does not belong to any such organization in this or any other State.

I further know that he has done as much to awaken as well as maintain an interest among the people of this State in game and fish protection as any one citizen within its borders. He needs no defense in this community, and no introduction to the editors of FOREST AND STREAM. He has manifested a spirit of fairness in indorsing the Baldwin Act by setting forth his reasons for doing so, with an able presentation of the facts as they exist.

I desire personally to add my indorsement to the act, and believe it one of the most practical ever introduced in our State for the enforcement of our game and fish laws. I trust that it may speedily be enacted into law.

ANSON S. DE VOUT.

DILLINGERSVILLE, Pa., April 9.—*Editor Forest and Stream:* Just a few words, please, in reply to Mr. McCain's article of March 28. I uphold neither the rich nor the poorer class of sportsmen. I believe in equal rights of all men. But is it honest, is it sportsmanlike, is it American in principle, to see our game exterminated? Does Mr. McCain wish his army of market-shooting friends to have full sway of our fields and forests, and continue, as they have in the past, to destroy our game in and out of season? These men sell their game to their friends, the game dealers, who always take the deepest interest in our furred and feathered friends; and the vast multitude of law-abiding sportsmen must, according to Mr. McCain's views, be denied all rights to use their voices in their grand fight against the extermination of game, because there are some more fortunate sportsmen who own a few silken-haired setters, wear a good suit of corduroy, are not dressed in "yaller overalls," and shoot a 12-gauge gun instead of an 8-gauge brush-mowing cannon. Such a man is dubbed a "city dude" by Mr. McCain. This is certainly very considerate for one who loves legitimate field sports.

I say again that field sports were made for a gentleman's recreation. A man need not have a large bank account to be a gentleman sportsman. I have gunned many and many a day with men who could not well afford to lose the time and money to enjoy a good day's sport, yet they were gentlemen sportsmen in my estimation in the fullest sense of the word. To these men no greater insult could be offered than to ask them to part with their game for cash. Such men I have found kind and generous to a fault; they would share the last crust of bread in camp with their fellow companion; but as poor as they were, money could not tempt them to part with their game.

Let the market-hunter find other employment to support himself and family than by the extermination of game; and if his love for the dog and gun be of the right stripe he will, I am sure, be able to save enough from his hard but manly earnings by fall to spend a few days afield.

I believe in protection in all matters pertaining to the pleasures of mankind, and a limitation even in the killing of game. If we cannot stop the sale of game, let us at least limit its taking by an individual to so many head of game in a season; in fact, have passed most any bill that will protect our game in some way from extermination. I know several station agents on the line of the D., L. & W. R.R. in Pike county, Pa., who informed me last fall that they had each shipped between 1,400 and 1,500 ruffed grouse to New York and Philadelphia markets. In conversation with Mr. George C. Swab, of Harrisburg, regarding the decreasing of our game birds, he told me that a stage driver in Sullivan county, Pa., had informed him that he had, during the season of 1896, carried 1,900 ruffed grouse for shipment to different points. How Mr. McCain or any sound-minded person can imagine this sort of butchery of our game will continue forever is beyond my comprehension.

L. W. MAZURIE.

Editor Forest and Stream:

Your correspondent W. W. McCain speaks of your editorial remarks as "captious, but considerate." How could they be captious, which his dictionary defines as "peevish, fretful and perverse," and at the same time be considerate, a synonym for "careful, discreet, prudent and deliberate"?

He refers to the remarks of Mr. Mazurie and myself as rancor, defined as "malignant enmity, inveterate hatred." Whether there was anything to justify the use of such terms I am perfectly willing to leave to your many readers to decide. They will also form their own conclusions as to their efficiency in supporting his position.

He also speaks of "gross misstatements." If they had been as flagrant as represented he should have able in a full column to have pointed out at least one. I do not intend to handle that kind of goods. If Mr. McCain will show me wherein I have erred in any statement I will retract, and do it most heartily. The case needs no false props.

BON AMI.

CHICAGO AND THE WEST.

Spring at Chicago.

CHICAGO, Ill., April 10.—We are threatened with spring at Chicago. A few of the larger lakes of Illinois, Indiana and Wisconsin are beginning to break open and offer the wildfowl a chance to wet their feet. Chicago sportsmen have already visited Lake Koshkonong and the Bingham canvasback hatchery in the hope of an early canvasback or two, and a few small bags of ducks are reported from various quarters, one of thirty-two by Prof Woodruff, at Liverpool, Ind. Some inquiries are coming in for jacksnipe ground. The Kankakee bottoms at Koutts, Ind., have been as fine snipe ground as existed in the United States. The high meadows near Water Valley, Ind., are the first grounds to show jacksnipe in the spring in this section. I should say that my friends would be apt to do well at these localities, and on the marshes that run to the north and northeast of these in Indiana, as those near Warsaw, the big marsh near Swift's Siding, etc., etc. Of course all this is said with reserve, as no man knoweth the habits of his majesty the jacksnipe.

In the Northwest.

The heavy floods which have caused such devastation in the Northwest within the past two weeks will to some extent affect the game supply of the season, probably in a beneficial way, more especially as regards the wildfowl. Many lakes which have recently been dry will be filled up again, this more especially in Minnesota and Dakota. Wisconsin waters are higher than for many years. The sportsmen of Horicon Marsh report more water than for ten years. Wildfowl have made their appearance in Minnesota, Dakota and Montana. Last week I saw numbers of geese in Montana. In the larger waters of Minnesota, such as Big Stone, Mille Lacs and Lac Qui Parle, ducks appeared this week in considerable numbers. Lake Minnetonka is beginning to break loose about the edges. The fish are beginning to run in the Northwestern waters, and I saw an occasional fish spear in evidence from the railway car windows as I passed through. The whole Red River Valley was a vast sheet of water, and for miles the wheat lands were submerged. It was not unusual to see farmers punting about in rude little boats over what had once been their grain fields.

The date of the appearance of wild geese in Montana, near the British line, is March 15 to March 18, there being but little variation from that time.

The Floods in the South.

For many days the press dispatches have been filled with accounts of the devastating floods which have been raging along the Delta country of the South, from Tennessee to the mouth of the Mississippi River. The loss of property and life through these floods is of so serious a nature as almost to preclude a lesser concern, yet these high waters will have a pronounced effect on the game of that country. The bears, deer and turkeys will be driven to the high ridges, where they will be helpless and without food and easily slaughtered. The deer will be obliged to wade in the water so long that the skin of their legs will rot and slough off. All species of game will suffer from the swallowing up of their food supply.

The Delta floods have been serious along the Yazoo and Sunflower districts, and I think that much or most of our Bobo bear country must at this writing be deep under water, though Capt. Bobo's plantation is situated upon the highest ground of that region, and is no doubt far from the edge of the flood.

Chicago Mayor a Sportsman.

Carter H. Harrison, Jr., this week elected mayor of Chicago, is the sixth son to bear that name, and the second to carry the name into the Mayor's office of Chicago. Readers of FOREST AND STREAM will be interested to know that Mr. Harrison is an ardent admirer of that paper, and a strict believer in its doctrines. There are few more ardent and enthusiastic sportsmen than he. His tendencies run perhaps rather to the rod than to the gun He has for a series of years been thoroughly acquainted with the best of the grayling streams of the Michigan South Peninsula, and has also fished the best of muscallonge waters of Wisconsin. Connected by marriage with one of the best families of New Orleans, Mr. Harrison is thoroughly acquainted in the State of Louisiana, and indeed in all the South. The family is originally a Southern one, and perhaps naturally turns to the sports of the open air. Mr. Harrison is a skillful amateur photographer, an enthusiastic bicyclist, a traveler of the world, a good shot with gun or rifle, and an expert with the fly rod. In angling he is fond of tying his own flies. All these things show that he is a fit man to be mayor of Chicago. And I will bet $1,000 that the first thing he does when he gets rid of that job will be to go a-fishing.

North Dakota Game Licenses.

Reference to the report of the State Game Warden of North Dakota shows that during the year 3,502 resident licenses and sixty non-resident licenses were issued. There is a disparity here which seems to be more than obvious. I fear the non-residents did not all register as such.

Wild Possum in Chicago.

A live wild opossum was caught last Sunday morning in the dooryard of George Pullman, the sleeping-car magnate. The beast showed great shrewdness in thus picking out a place to go to sleep, but I'll bet it had to pay $2 and a tip. The origin of this, the last of the wild animals to be discovered in the environs of Chicago, cannot be traced, but it is believed that the creature was endeavoring to escape from the clutches of Possum Bill Werner.

Illinois Warden Candidates.

Friends of Harry Loveday, of Chicago, have for some days been earnestly urging his appointment as State Game Warden, some of these friends having joined Representative H. D. Nicholls at Springfield for the purpose of laying Mr. Loveday's name before Gov. Tanner. Mr. Loveday is a member of the Cumberland Gun Club, of Chicago, and a shooter well known around this city. His nomination, however, is not made by action of the Illinois State Sportsmen's Association, and indeed members of the executive committee of that body this week telegraphed a protest to Gov. Tanner, asking that action be delayed until the Association shall have made its recommendation. This protest was seconded by F. S. Baird and M. R. Bortree, of the National Association, who also wish a different man, it seems. Mr. Loveday's nomination is said to be satisfactory to Mr. Geo Sloan, who in a way takes the place as king of South Water street, if any one man can be said to occupy the throne since the time of Col. E. S Bond. The Illinois State Association has as yet come out for no man for State warden, and has made no secret recommendation to the Governor; but the claims of two or three men are being quietly investigated, and before many days have passed there will be a choice made to place before the Governor, with what result is of course problematical.

Nothing has occurred as yet at Springfield in the way of legislation which deserves extended comment at this writing. Mention was made earlier in these columns of the somewhat remarkable game warden bill drafted by F. S. Baird. Not long ago Mr Baird, with Messrs. W. P. Mussey and R. B. Organ, of the Illinois State Association committee, went down to Springfield in the interest of this bill. Billy Mussey said to-day when interviewed in regard to this: "Well, after a prolonged effort on behalf of the bill, we at length succeeded in getting it killed in the committee room. It is not every sportsmen's committee that does so well as that. Sometimes one of our bills gets clear up to the House." It is thought that the efforts of a gentleman of the name of Blow had something to do with the demise of this bill, but of this no definite word is known. Warden Blow would, if pressed, take the office of warden again just as it is, and would, I doubt not, continue to wage relentless warfare upon the farmer boy who shoots a bird. What we need is a warden who will find some way of getting into the big game freezers of Chicago. That is a question which affects the sportsmen of the entire West. The killing of Illinois game does not affect any one outside this State and very few inside of it, certainly almost no Chicago shooter, for no Chicago shooter hunts in Illinois nowadays. It really makes no difference what sort of law we have about open seasons and not very much difference about the question of spring shooting, although the latter is the main point to be considered in any new law. The game dealers know this fact if the sportsmen do not, and they are willing to give us almost any kind of a law we want for the Illinois game. But when it comes to a question of an act that will really do some good, an act which will force the marketmen of South Water street to be law-abiding citizens, such as the rest of us are supposed to be in our business pursuits—then it is a horse of a different color. One year of legality on South Water street in Chicago will mean ten years more of shooting for the law-abiding men of the West, Northwest and Southwest who love a day out of doors now and then.

Col. C. E. Felton, president of the Illinois State Sportsmen's Association, has to-day written and telegraphed to Governor Tanner asking delay on the appointment of a State warden until his association has made report. Col. Felton's illness has been earlier mentioned, but to-day it is expected that his recovery will be steady from this date.

Guns Out.

A great many guns came out of the cases to-day, and a considerable number of our shooters are out of town for a couple of days after snipe and ducks. Most of these shooters have gone to Indiana. Within a week, if all goes well, we shall hear of snipe near at hand. To-day we had snow and a cold rain, the glorious climate of Chicago being very jealous of its reputation, and always paying for a bright day with a dozen bad ones. This climate is simply sinful in the winter, and it is winter until the Fourth of July. E. HOUGH.

1206 BOYCE BUILDING, Chicago.

AS TO SOME OTHER DUCK EGGS.

I.

From the New York Sun.

MR. JOHN HENRY KEENE, of Baltimore, is writing his name among the benefactors of the country. For some time it has been the cause of just regret that the canvasback duck, beloved of all good men and gods of good digestion, is vanishing gradually from its feeding grounds. The wild celery grows; the mouth waters; but the duck, oh, where is he? The time seems not distant when not even the banquets of kings and pontiffs will know him any longer. Mr. Keene believes that the depopulation of the Chesapeake is caused by the destruction of the eggs in the Canadian lakes, where the canvasbacks breed. According to Mr. Keene thousands of barrels of eggs are sent from the breeding grounds to this country and to various parts of the United States. He proposes that a prohibitive duty be laid upon imported wild duck eggs. It seems that Mr. Keene has talked with the Governor-General of Canada on the subject.

II.

From the Richmond Dispatch, copied by the Washington Star.

The Earl of Aberdeen, Governor-General of Canada, and Mr. John Henry Keene, of Baltimore, have started a protective movement that will doubtless meet with the approval of sportsmen and epicures generally, and ex-Pres. Cleveland in particular, the latter's pronounced free trade notions to the contrary notwithstanding. The movement is for the protection of the canvasback duck, or, rather, for the protection of the eggs of the canvasback duck.

For some years this most delicious of all the duck family has been growing scarcer and scarcer in its usual feeding grounds, and not a few especially favored places that once knew it to plenitude know it now no more.

Mr. Keene, referring to the rapid disappearance of canvasbacks from the waters of the Chesapeake and its tributaries, attributes it more to the destruction of the eggs along the shores of the Canadian lakes, which constitute one of their chief breeding grounds, than to any great slaughter of the ducks. In a conversation with the Earl of Aberdeen, Mr. Keene said he had been informed by persons who were posted on the subject that thousands of barrels of the eggs were shipped during the laying season to different parts of Canada and across the border into the United States, and that the business was a profitable industry, as no expense and but little capital were necessary to carry it on. The Earl, we are told, expressed great surprise at this information, and promised to do everything in his power to remedy the evil. Mr. Keene's idea is that a heavy duty—a duty amounting to an embargo—should be laid upon wild duck eggs imported into this country, and he is to furnish to the Earl certain data regarding the habits of wild ducks, the time of their arrival in Maryland and Virginia waters, their food, etc., which will enable the Earl to coöperate intelligently with him.

This is a matter of decided interest to the people of Virginia and Maryland living along the waters of the Chesapeake and its tributaries; and that aside from the standpoint of the sportsman. In these waters canvasbacks were wont to winter in large numbers, owing to the abundance of their favorite food, wild celery, and were a source of decided revenue to many of the poorer class. It is conceded that the canvasback duck is a greater delicacy than any other waterfowl that frequents this section, and consequently it commands a higher price. If therefore the movement under consideration shall conduce to restocking our waters, so to speak, the results may prove quite an item from a monetary point of view.

III.

Letter from the FOREST AND STREAM *to Mr. Keene.*

We see in the New York *Sun* a brief note of your proposition that a prohibitory duty be laid upon importing wild duck's eggs, because thousands of barrels of such eggs are sent to this country from the breeding grounds in this territory north of the United States. We have been seeking for some positive and reliable data and statistics relative to this industry. If you can supply us with such material for publication, we would be glad to use it for the benefit of the cause.

IV.

Mr. Keene to the FOREST AND STREAM.

I have yours of the 21st inst. "Positive and reliable data" relative to the shipping of wild duck eggs can be only obtained by employing an agent to visit the country where the eggs are laid, who could thus, and only thus, obtain the information.

The Earl of Aberdeen, Governor-General of Canada, had no authentic information on the subject.

You will see how difficult it must be to obtain proof in any other way than by a commissioner visiting the localities in question.

I met the Earl at Sir Julian Paunceforte's reception and ball, and we there discussed the question.

I should think the dealers in eggs in New York ought to be well fitted to acquire full information upon the subject. New York is a general headquarters for information, and your reporter could work the subject up to advantage by starting an inquiry among your dealers.

The information I have is not legal competent evidence. But there is not a candy nor confectioner's shop that has not eggs colored, known not to be domestic, and the trade is enormous. I found the same kind of eggs in London, Paris and other shops of Europe. When I asked, "Where did you get them?" they replied: "They are wild duck eggs from North America."

The subject is one that is worthy of careful investigation and nothing can be done either by your own Government or by the Canadian until steps are taken in a businesslike way to thoroughly investigate the question by a commission. If your sportsmen will take the initiative our Secretary of State would doubtlessly lend all the aid of the Government to the discovery of the facts, and make a special report to Congress and get some legislation on the subject. Nothing more than is now known will be known unless gentlemen of leisure and means, who take an interest in the question of the cause of the disappearance from the Chesapeake, Southern and Eastern waters of all wild ducks, will ever enable us to discover positive, "reliable data and statistics" upon this highly important public inquiry respecting a great food and commerce question which is involved in the obscure question of the foreign egg traffic and industry.

I have scarce a moment for outside duties, but I shall cheerfully do the little I may to throw any light upon this important subject.

V.

FOREST AND STREAM *to Mr. Keene.*

We thank you for your favor of the 22d with regard to the destruction of wild duck eggs in the North. Some months ago it was reported that great quantities of duck eggs were taken in Alaska and the northwestern Canadian territory to be shipped to this country for the manufacture of albumin. We investigated the question somewhat thoroughly at the time and were unable to discover the existence of any such traffic. We are therefore particularly interested in this subject, and would be glad to cooperate with you in any way looking toward a determination of the facts with reference to the importation of those eggs into this country for confectionery and other purposes.

VI.

Mr. Keene to FOREST AND STREAM.

Yours received. The way to elicit information is to agitate the question and keep on. There are plenty who know, and if you would publish such letters as I wrote you public inquiry would be awakened, stimulated, and nucleus be formed which would take deep hold upon public attention, and then the revolution would commence.

VII.

Is there anything in it?

We have made extended inquiry among egg dealers and confectioners in New York, and can find not the slightest trace of wild duck eggs brought into this market for candy store purposes or any other. The colored eggs in confectioners' shops here are hen's eggs, paper eggs, silk eggs and sugar eggs; and some of them at Easter are large enough to contain within the shell a full-grown, full-fledged canvasback duck.

Are there any known facts to warrant an opinion that the depopulation of the Chesapeake is caused by the destruction of the eggs in the Canadian lakes, where the canvasbacks breed?

THEY ADOPT THE PLANK.

FOREST AND STREAM PLATFORM PLANK—The sale of game should be forbidden at all seasons.

NORTH DUNBARTON, N. H., April 8.—*Editor Forest and Stream:* At the recent third annual meeting of the Hillsborough County Game and Protective Association, I as a guest spoke of the benefits of prohibiting the sale of game.

Hon. William C. Clarke, Mayor of Manchester, and a thorough sportsman, said that I had, through the columns of *Sport*, shown clearly that we needed such a law, and that in his opinion it was bound to come. The motion was made and passed that the Association adopt the platform of FOREST AND STREAM.

The Hillsborough Association is young, but so far has been active, and it is evident fully intends to be of practical benefit to the fish and game of New Hampshire. I inclose under separate cover a copy of the Manchester *Mirror and Farmer*, containing an account of the meeting.

The *Mirror and Farmer* report runs: The third annual meeting of the Hillsborough County Game and Protective Association was held at the City Hall Tuesday morning, and was followed by a banquet and smoke talk at the New City Hotel in the afternoon. The meeting was one of the largest and most interesting yet held and brought together sportsmen from many parts of the country. Matters pertaining to the preservation of fish and game were earnestly discussed, and especially the subject of closed brooks and the proposition to pass laws aimed at pot and game hunters. The morning session was called to order by President Beasom at 11 o'clock, and the report of the secretary and treasurer was read by that efficient official, George P. Kimball, of Nashua. The report of the treasurer showed the Association to be in a good financial condition. The secretary reported: "During the year three successful prosecutions have been accomplished upon evidence furnished officers of the Association. Several complaints during the year have been investigated, but the evidence in each case being insufficient to convict no arrests were made. The accurate evidence is very important in order to secure a conviction, and rumor does not constitute evidence, nor can it be depended upon to secure conviction. A large amount of printed matter was sent to every member of the Association at the commencement of the year, consisting of large cloth posters and small paper folders with a synopsis of the fish and game laws. We also forwarded some to every postmaster in the country, with the request to post them in a conspicuous place, and in most cases we think the request has been complied with. The work must be kept up in good earnest, and we shall certainly see excellent results in due time."

The nominating committee reported that the officers for the last year had performed their duties so ably that the committee could not better the list. They therefore presented the same list as before, with the exception that the name of E. W. Clark, of Nashua, was substituted in the executive committee in the place of Hon. Nathaniel Wentworth, of Hudson Center, who did not wish to serve on account of being connected with the Fish and Game Commission. The following officers were therefore unanimously elected:

President, W. H. Beasom, of Nashua; Vice-Presidents, Edward P. Morrill, of Manchester; Dr. H. S. Hutchinson, of Milford; Secretary and Treasurer, George P. Kimball, of Nashua. Executive Committee—the president, vice-presidents and secretary, also Daniel Cragin, H. W. Hopkins and A. Beard, of Wilton; E. W. Clark, of Nashua; C. J. Darrah, F. H. Thurston, Col. Arthur E. Clarke, of Manchester.

The meeting was then opened for discussion, and Mayor Clarke was called upon by the president. Mr. Clarke said that Mr. C. M. Stark had recently called attention to the necessity for a law against market-hunters and pot-hunters. Mayor Clarke said that this law must come sooner or later in New Hampshire, or else our fish and game would be exterminated. A man who went out for a day's sport generally found that the market-hunter and pot-hunter, who made it a business, had been ahead of him. Mr. Stark told the Mayor recently that he knew of one man alone who had killed 300 partridges in the last year. The Mayor spoke of Bear Brook, one of the best natural trout brooks in the State, which had been closed for three years and would be opened this June. He said that there were two pot-hunters named Foote, who, in his opinion, would get nine-tenths of the trout that came out of that brook. He said closing a brook for two or three years simply advertised it when it was opened.

President Beasom said he thought Mayor Clarke's suggestion was along the line that the sportsmen of the country were fast coming to see would be necessary before long. He also spoke about the amount of fry put out in this country, and said that Hillsborough called for less fry than any other county in the State. He said that sportsmen ought to exert themselves to see that more fry were distributed each season, and that this would be much more effective than closing of brooks.

C. M. Stark, of Dunbarton, formerly the champion wing shot, said he thought that the birds were shot off too close each season and that not enough were left to breed. He thought that if there was any way of identifying game, a lot of Maine and New Hampshire game would be found in the Boston markets, although the dealers generally claim that it comes from the West. He spoke of the reported fact that four men in Texas in one day shoot 1,200 ducks, which would have gone a good way, he said, in furnishing sport for the whole of New Hampshire. He thought it was in the true interests of all to protect our game from the pot-hunters, and said that the principal opposition to such a law would come from the dealers themselves.

Judge E. E. Parker, of Nashua, said that regarding closed brooks, his ideas were about the same as Mayor Clarke's. The year after they were opened everyone would fish there and get big strings, and the next year no one could get a bite, as the brooks had been entirely fished out. Judge Parker said that he had found many people outside of the large cities who did not understand the real object of this Association, and thought that it was simply to meet once a year and have a big feed. He thought that the members ought to take particular interest in disseminating the true objects of the society, and the actual work that it has done.

President Beasom said that perhaps some of the members themselves did not really understand what the Associ tion was doing. The membership was about 100, and was well kept up. The society circulates copies of the fish and game laws and also posters to go on trees and barns. This year the town of Brookline has appointed wardens to stock the brooks and to put out twenty-five posters. One experience has been that the majority of people, if they know the law, do not go to work to deliberately violate it. A deer was killed recently on Sunday, and within two days Mr. Wentworth and myself received notification from a half dozen people. They were as interested in the killing of the deer as if the man had come into their yard and killed a cow. The people of Hillsborough county don't want the deer killed, but ordinarily nothing would have been done about this. In this case, however, by reason of the posters, the people knew just who to send to, and within a week we had that hunter under arrest.

E. W. Clark, of Nashua, made some remarks along the same line. Edward R. Robinson spoke in favor of restricting the sale of game. Fred Whitemore, of Nashua, Charles Hodge, of this city, and others also made interesting remarks.

Colonel Noyes, of Nashua, made a motion that the Association adopt the platform of the FOREST AND STREAM, and place itself on record as favoring a law preventing the sale of game. The motion was passed.

VERMONT GAME.

SHELDON, Vt., April 3.—Spring, spring—chilly, raw, cold, slushy, sloppy, neuralgia-producing spring—has come again, and we now between aches and chills look about to see if the past severe winter has left us game enough for seed.

Ruffed grouse are fairly abundant except in the immediate vicinity of the French settlements, where the pot-hunters are many and hunt seven days in the week without any respect for the close season.

Squirrels there are none. In our rambles through the sugar bush and over the oak ridges we have not seen even a sign of a squirrel, gray, red or chipmunk.

We hear favorable reports about quail during the winter. They were often seen "seed hunting" in the farmers' barnyards.

Foxes are here in their usual numbers, and are here to stay, as they are becoming more and more wary and wise each year. Our fox hunters report poor luck, for reynard avoids the old-time runways, and is full of new tricks to bother the hounds. In the early winter I bagged with Whirlwind and Drive five foxes, when the grippe came along and stopped our sport for the rest of the season.

A few weeks ago a young man in a neighboring town was out partridge hunting (close season) and saw in the white birches a pheasant, which he promptly potted, and then exhibited it publicly on the streets in the village. Among those who saw it were one or two prominent members of our fish and game protective society, but no action was taken to punish the fellow for this flagrant violation of the game law. An outsider, however, reported the fact to the writer, who was then too ill to give it personal attention, referred the case to Fish Commissioner Titcomb, and we are daily expecting to hear of an arrest and conviction. The penalty is $25 and costs.

There are unfortunately some so-called fish and game protectionists who shine at the league's banquets and social gatherings, but when it comes to doing actual work in enforcing the fish and game laws, or giving information against violators of the laws—oh, they couldn't entertain for a moment the idea of stooping to do such a low thing, and then, "you know," they might want to use these fellows' votes, etc. They are the ornamental tinsel of fish and game protection leagues—all glitter, but of little or no service.

We are satisfied that the large majority of persons who visit our aviary to see the Mongolian pheasants would, if those birds were released, pot them at sight if they thought that they could do so undetected. We often hear remarks, "When are you going to let those birds out? I would like to have a crack at them." Their whole desire so far as game is concerned is to kill. It matters not how rare or beautiful the animal or bird may be, their only interest in it is to shoot or club it to death.

The older we get the more firm we are in the belief that the trait of true game protection is an inborn one. Where this is acquired through education it is not always to be relied on in the moment of temptation.

A friend who is an enthusiastic game protectionist is constantly striving to instil this virtue into the minds of those in his employ. One of his young men whom he believed to be a sound convert, and to be relied on to observe the game laws under any and all circumstances, was one day seen to leave his work in the field and run at full speed toward the house, when within hailing distance he shouted: "Get your gun, get your gun, some of Mr. ——'s birds are down by the stump fence and we can shoot the whole batch of them at one shot." Investigation showed a covey of quail huddled together under the fence. The young man didn't get the gun.

Robins first arrived here this season March 21; bluebirds one week later, March 28; song sparrows and meadow larks, April 3. STANSTEAD.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

SOME ODD FIELD INCIDENTS.

I.

Speaking of quail reminds me of a hunt I had one day last November with Mr M., from Norfolk, Va., who was out here on business. Having heard him say he enjoyed quail shooting, I proposed a drive in the country with guns and dog, which he very willingly accepted. We had driven a few miles out when old Jack turned in to the left, went about 50yds from the road and pointed in some broom grass and scattering pines. We got out, tied the horses and walked in. I told M. to shoot to the left and I would shoot to the right. When the covey flushed Mr. M. banged away with one barrel, but did not have time to shoot again, as he had seen his bird fall and could not wait for the dog to retrieve; so away he went and picked up his bird—not a quail, but a woodpecker, one of the small, dark kind, almost black. Now, how did this happen? Was the woodpecker flying past just at the time he fired, or did he flush with the quail? When M. held up that woodpecker I felt very much like laughing, but as he had one charge left in his gun I thought under the circumstances and from the expression on his face it might be best to defer the laugh until he had time to recover.

We have had no cold to hurt the birds this winter, and the prospect is fine for next fall. A. S. R.

North Carolina.

II.

While hunting woodcock last September in what is called "the double ditches," a large swamp about two miles below Alexandria, Va., a rather strange thing occurred.

It was rather early in the morning when my cousin and myself entered the swamp and separated, he going on one side with his English setter Major, and I the other with my two Gordon setters Shot and Quick. Before I had gone very far my dogs came to a stand by a little branch. On my coming up to them a woodcock flushed and went down the branch a little way, then turned into the swamp. Just as he made the turn I shot, and saw him pitch forward as if hit; but on bringing the dogs to the spot and hunting for it a good while I was about to give it up, when Quick threw his head into the air and came to a stand right at the bottom of a dead tree. In the tree sapsuckers had bored a great many holes, and on looking up I was very much surprised to see the cock apparently clinging to the side of the dead tree just out of my reach; but on examination I found that his bill had run into one of the holes made by the sapsuckers and held him there. I called my cousin to look at it, but he would not believe that I did not put it there myself. I hope that one of your many readers may have had a similar experience and will tell about it, so as to set me straight with my cousin. C. H.

Washington, D. C.

WRITE TO YOUR SENATOR.

Washington, D. C., April 7.—*Editor Forest and Stream:* Early in February last a few enthusiastic sportsmen called an informal meeting to discuss the question of game and fish protection within the District of Columbia. They realized that something must be done to stop the handling and sale of game and fish within the District of Columbia during the close season

It was decided to call a mass meeting, that those citizens interested in the subject might attend and organize an association for the protection of game and fish. The meeting was called and resulted in the organization of the District of Columbia Game and Fish Protective Association, which at present is over 300 strong and growing in membership daily. The association, finding that the laws were unsatisfactory, appointed a special committee to draft two bills, one for the protection of fish and one for the protection of game.

Senate Bill 1487, introduced by Mr. Proctor, relative to the Potomac River and tributaries, protects black bass, crappie, striped bass, April 15 to June 1, and forbids sale of striped bass or rockfish of less than 1lb. weight.

Senate Bill 1488, introduced by Mr. Proctor, makes close seasons as follows: Partridge, quail, Feb. 1 to Nov. 1; woodcock, Jan. 15 to July 15; prairie chicken, pinnated grouse, Feb. 1 to Sept. 1; rabbit, Feb. 1 to Nov. 1; snipe, plover, May 1 to Sept. 1; wild duck, goose, brant, April 1 to Sept. 1; rail, ortolan, reed bird, rice bird, Feb. 1 to Sept 1; deer meat, venison, Jan 1 to Sept. 1. The possession and sale are forbidden in the close season; and "the fact that the said birds, fowls or meats were killed or captured outside of the District of Columbia shall constitute no defense for such possession"

The foregoing bills have been introduced in both branches of Congress, and the Association hopes to have them enacted into laws in a very short time. When they are the District of Columbia will cease to be a place where the pot-hunter can dispose of his game at any and all seasons. Most of the game that is sold here is killed in the West, so that the Western sportsmen should be particularly interested in the passage of these bills. It is hoped that each and every sportsman that may chance to read these lines will use his influence with his Senators and Congressmen to aid in passing the foregoing bills. Don't delay, but lend us your helping hand at once. J. D. Arnold

Michigan Deer and Lumber Camp.

Concerning the report made to Mr. W. B Mershon of deer killed for lumber camps in the Upper Peninsula of Michigan, State Game and Fish Warden Chase S Osborn writes to Mr. Mershon: "It concerns a matter that has been common talk up in this country and was a common practice for years until the past two winters. We have convicted hunters and lumbermen in almost every county in the Upper Peninsula for this work and have practically broken it up. At least one of the towns mentioned in your memorandum is in Wisconsin, and, of course, we have no jurisdiction there. However, I am glad to have any information you may be able to transmit to me at any time, and if your representative knows or can learn of any specific violation I would be glad to have information of it."

One great trouble in the present time though is, as Mr. Mershon has pointed out, that local or county game wardens are dependent upon the liberality of the Board of Supervisors for a salary, and the result is that they get nothing and do nothing.

Yellowstone Snow and Game.

The deep snows of the Yellowstone Park this winter have been disastrous to the game. A Cinnabar correspondent writes that a man recently out from Yancey's reports a number of calf elk found dead, and that the bulls are in poor condition.

Belknap County League.

Laconia, N. H., April 10.—*Editor Forest and Stream:* The subject of legitimate game and fish protection is receiving a good deal of attention among sportsmen in New Hampshire at this time, which is very gratifying to all true sportsmen. In this section of New Hampshire, which is essentially the lake section of the State, constant care and attention is required to see that the fish and game laws are observed, and the subject of an association composed of men who are interested in the protection and propagation of fish and game has long been advocated by reputable sportsmen in this vicinity. Accordingly, on the 6th inst., the Belknap County Fish and Game League was organized in this city. The objects and purposes for which the Association is organized as stated in its constitution are as follows:

1. The protection, propagation and increase of game and fish in the woods and waters of Belknap county, to the reasonable, legitimate and equal use and benefit of the community for food and support.

2 The securing of the enactment of such laws as shall seem best adapted to securing the results for which the Association was organized.

3. The use of all consistent means to prevent violations of the laws of the State relating to fish and game within the limits of Belknap county, and the detection and punishment of the same.

4. To furnish recreation for the members in trap-shooting, and further for the accomplishment of the object and purposes for which the Association is organized the members are pledged to observe the fish and game laws, to exert their best efforts to secure a like observation on the part of all others, and report to the officers of the Association any case of infringement which may come to their knowledge and coöperate with them in securing the detection and bringing to justice of the same.

The Association starts off with a large and enthusiastic membership. S. S. Jewett, Sec'y.

Western Hunting Grounds.

Philadelphia, April 7.—*Editor Forest and Stream:* About the 25th of this month I expect to start for Red Lodge, Mont., on the way to the Sunlight Mining district, where I shall remain until the last of November or December mining I extend a hearty invitation to any and all brother sportsmen coming West on a tour through the Yellowstone Park, or on a fishing and hunting trip. I shall be glad to have them visit my camp, and spend as much time as they may desire gratis. Big game, elk, deer, bears and sheep are plentiful within a very short distance of camp, and I can guarantee them all the sport that an honest hunter may desire. I will cheerfully arrange with good guides, who have safe pack and saddle horses, at very moderate terms. Stopping with me will cost them nothing. They can make the Park in one day's ride from camp.

Last year in my letters to Sammy, which were published in Forest and Stream in May, I believe, I recommended the guide we had the previous October, Ed. E. Van Dyke. I wish to apologize to brother sportsmen, and Forest and Stream in particular, for having done so. Lately I have received letters asking if I recommend him. To all such my answer is: I will not. Having spent six months last year in and near by Red Lodge, I have had an insight into much that three weeks' hunting the previous year did not develop

If any one of Forest and Stream's readers contemplate taking such a trip and will write me, I shall take pleasure in arranging a hunt for them with excellent men, who will guarantee them shots at game or no pay, and who will take the best of care of them. Any of the readers of Forest and Stream, with good credentials from same, I shall be glad to entertain and give them all the sport one could wish with rod and gun gratis. Wabash.

Some Truth in This.

Much of the violation of the game and fish laws may be traced to organizations which are ostensibly strict observers of the laws, but in reality are not. There is a phase of the business which is not unlike the attitude of many parents in relation to coasting. They will cuss policemen if they do not compel boys to refrain from making toboggan slides of the walks to the peril of life and limb of pedestrians, and think an example should be made of every offender—unless it should happen to be one of their own boys. In that case it is different. It was only our Willie, you know, who is a much nicer boy than any other Willie and in whose case it is a proper thing to make an exception. He can be depended upon to violate the ordinance with discretion, so let him slide and look after the other Willies. There is an element of inconsistent logic like that in many organizations for the protection of game and fish which makes them inefficient and often causes them to do more harm than good. They either are not careful enough in the admission of members or are too lenient with the Willies of their own club family who drop into violations of the laws. The Willies, or plain Bills of the interior, are not slow to take note of these inconsistencies. If they have been made honorary members of a town club and semi-official deputies to watch the streams it has stocked, and see that no grouse or other game is unseasonably killed or shot at in the adjacent underbrush, it does not increase their ardor in the work to find club members violating the laws, either on Sundays or other days, or to have the club smooth the matter over when they report such violations. On the contrary, the disgusted rural deputy is likely to secure some ammunition or bait and proceed to do some business himself.—*Pittsburg (Pa.) Commercial Gazette.*

Wildfowl Shooting in City of London, 1740.

Editor Forest and Stream:

I find the following curious bit in *The York Courant*, Jan. 8, 1740; "Yesterday great numbers of London Gunners assembled at the several Stairs leading to the Thames to shoot Gulls, Ducks and Road Geese, which appeared in great Plenty; and many of them were killed, though none could be brought off, the Frost not yet having prevented the Currency of the Tide. Dogs were of no use to the bringing them off, the Edges of the Ice on which the Birds settled being too weak for the Dogs to get up by."

Query.—What were the "Road Geese" and what is the significance of the term? F. C. Browne.

The Forest and Stream is put to press each week on Tuesda Correspondence intended for publication should reach us at th latest by Monday, and as much earlier as practicable.

Wildfowl in Boston Harbor.

The Massachusetts wildfowl law respecting use of boats reads:

Whoever pursues any wildfowl with or by aid of a boat propelled by steam or by naphtha, or by aid of a boat or vessel propelled by any mechanical means other than sails, oars or paddles, shall be punished.

A special law, approved March 19, 1897, reads:

Whoever, within the limits of that portion of Boston Harbor lying westerly and southwesterly of a line running from Deer Island to Point Allerton, including the waters of Dorchester Bay, Quincy Bay, Weymouth Bay and Hingham Bay, shoots at, kills or pursues any wildfowl from or by the aid or use of any boat or floating device propelled by any mechanical means, shall be punishable by a fine of $20 for each offense.

Our interpretation of the new local law, read in the light of the general law quoted above, is that on the waters named the use of sailboats is prohibited.

Michigan's Proposed Five-Years Close Time.

East Saginaw, Mich., April 8.—Bills are before the Michigan Legislature, I understand, to prohibit the use of pointers and setters, or any kind of dogs, in hunting and to make a closed season for quail and partridges for five years. Both are nonsensical measures. Quail and partridges were never so plentiful around Saginaw, in my knowledge, as they were last fall. Stopping all market hunting, enforcing the law locally and a short shooting season have preserved the partridges, and add to this the favorable winter, and we have the cause for quail being so numerous. I believe these birds have wintered well, and if our game laws are generally enforced and observed, the game supply of this State will increase. W. B. Mershon.

Forestry Commission Recommendations.

As already stated, the detailed and formal report of the Forestry Commission will not be ready for submission to the Secretary of the Interior for some weeks yet, but it is likely to be made early next month. Meantime five members of the Commission have united in a letter to the Secretary of the Interior, which we print below, which gives in general terms the substance of the report to be made. This letter will be read with great interest by all persons in the arid West, and especially by all miners:

"The legislation relating to reserved forest lands of the public domain which the Commission of the National Academy will recommend in its final report, now in course of preparation, provides for the following:

"First, that authority be given to the Secretary of War to make details of troops at the request of the Secretary of the Interior to protect temporarily and until a forest service is organized the property of the Government in the forest reservations from fire and trespass, and to enforce such rules and regulations as he may make for their care.

"Second, the establishment of a permanent forest bureau in the Department of the Interior, composed of trained officers, to administer, maintain and improve the reserved forest lands.

"Third, the appointment of a commission to institute as rapidly as possible, under the supervision of the director of the geological survey topograpical surveys of the reservations, and determine what proportions of them should be permanently reserved on account of their forest covering, and what portions should be reopened to entry and sale

"Fourth, to authorize the Secretary of the Interior to issue the necessary rules and regulations for the protection, growth and improvement of the forests on the reservations, for the sale of timber, firewood and fencing from them to actual settlers in and adjacent to the reservations, and to owners of mines legally located therein for use in such mines; for granting permits to sawmill owners to enter the reservations for the purpose of manufacturing such lumber as may be sold to actual settlers in and adjacent to the reservations, and to the owners of mines located therein; for allowing actual settlers who have no timber on their own claims to take from the reservations firewood, posts, poles and fencing material necessary for their immediate personal use; for allowing the public to enter and cross the reservations; for granting the county commissioners right of way for irrigating ditches, flumes and pipes, and for reservoir sites; and for permitting the prospectors, under such rules and regulations as he may from time to time establish to enter the reservation in search of valuable minerals.

"The Commission will recommend that the reservations be opened to the location of mining claims under the general mineral laws, and that the owners of valid mining locations in the reservations made and held in good faith shall be permitted to fell and remove from their claims the timber growing on them for actual mining purposes in connection with the particular claim from which the timber is cut. It will also recommend that the owners of unperfected *bona fide* claims or patents of land included in the forest reservations be permitted to relinquish their claims to the Government, selecting in lieu tracts of vacant land open to settlement, but not exceeding in area the tracts covered by their claims or patents, and that the owners of such unperfected claims shall not be subjected to additional charges for entries or record, and that credit shall be allowed them for the time spent on the relinquished claims. The Commission will also recommend that the Secretary of the Interior be authorized to enter into negotiations with the land grant railroad companies for the purpose of concluding agreements by which these companies may relinquish to the United States the title acquired by them to lands within their granted and indemnity limits when these lands lie within the boundaries of forest reservations, and may accept other unappropriated lands in exchange for the even-numbered sections within their granted and indemnity limits not included in forest reservations.

"Signed: C. S. Sargent, Henry L. Abbot, William H. Brewer, Arnold Hague, Gifford Pinchot."

New York Legislature.

(Correspondence of Forest and Stream.)

Albany, April 12.—A. Printed 2,096, Assemblyman Ives, general amendments to the game law prohibiting hounding for five years, and making the close season for deer Aug. 15 to Nov. 15, both inclusive.

S. 1,149, Senator Malby, relating to the possession of venison.

A. Printed 1,553, Assemblyman Eldridge, relating to fishing in certain waters in Warren county.

S. 775, Senator Mullin, making an appropriation to acquire lands in the St. Lawrence State Reservation.

S. Printed 1,222, Assemblyman Hobbie, amending the game code relative to the right of protectors to make search or examination.

The Assembly has ordered this bill to a third reading:

S. 261, Senator Krum, providing for the publication of the game laws.

The Assembly has passed the following bills:

S. Printed 1,354, Senator Ellsworth's Adirondack lands bill. Signed by the Governor on the same day it was passed. Chapter 220.

A. 485, Assemblyman Meyer, relating to salt-water striped bass.

A. 1,180, Assemblyman Miles, for the prevention of forest fires.

Mather.

"Angling Talks."

We have a very few copies of George Dawson's "Angling Talks," a series of chapters of entertaining chat about men, fishermen, fish, fishing and fishing places. Cloth, 50 cents. Forest and Stream Publishing Co.

A Stray Shinplaster

Comes to us once in a while for a copy of "Game Laws in Brief;" but shinplasters nowadays are scarcer than Moose in New York; and 25 cents in postage stamps will do just as well.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

MEN I HAVE FISHED WITH.

XXXIX.—John A. Fish.

JOHN is a farmer, now living at Honeoye Falls, N. Y., where he was born when the century was fairly young. Fishing and shooting with him was one of the pleasures of life, and I enjoyed his companionship while I lived near him. He was coeval and contemporary with Mort Locke, who was written up a couple of weeks ago. When the nuts began to drop we three would meet without appointment in the store of William Downey, and after a general talk some one would say: "It's getting to be most time for ducks"; the rest would assent in a manner that seemed as though they hadn't thought of that before, and we would wait for the first hard frosts and a word from some friend of John's on Cayuga Lake.

Then came the happy days of anticipation; discussing the amount and kind of provisions to be taken, the furnishing of the camp with cooking utensils and with blankets, all to be recorded in order that nothing should be omitted and no duplicates carried. The evenings spent in considering these important questions seem to-day to have been the most enjoyable part of the outing, because they covered about four weeks of anticipation wherein the promise of sport was only a week in camp. In some cases the pleasure to come was in excess of the experience, but when we really made a start, and the train actually moved eastward with our trunk of wooden decoys and our camp equipage, four adult boys looked out of the windows to keep their delight from being projected from their eyes. The pleasures of anticipation do not seem to have received their proper share of recognition among the pleasures of the sportsman, as I read their accounts of fishing and shooting trips, in which the size of the bag seems to be the measure of their sport. Yet most human pleasure is in his prospect, with a considerable amount in the retrospect. Pope, who closely analyzed humanity, wrote:

> "Hope springs eternal in the human breast:
> Man never *is*, but always *to be* blest"

John's crops were secure, and the event of the year was to come. Mort Locke had his leave from the railway by paying for a substitute; Downey might get off for a few days if not crippled by rheumatism, and I looked for a rest from quarrying rock for the trout ponds which I had dug with pick and shovel. To hard-working men who could seldom get away for a full week it was truly the event of the year, and had been made to cover many weeks before, as has been told. There is no rule by which we may measure enjoyment as one might measure time or the distance to the moon. We were like four boys let loose from school, only the boys experience that pleasure every day, and we had it only once a year. A man who can take a week off whenever he pleases knows little of the ecstatic feeling which we four had on that annual outing; he doesn't look forward to it and enjoy it in anticipation. Prince Hal says:

> "If all the year were playing holidays,
> To sport would be as tedious as to work."

Canoga Marsh, on the west side of Cayuga Lake, was always our camping ground; and we hired boats at the head of the lake, and did our own rowing, camping and cooking. That is an ideal way to camp for young men who can do it. Later in life we prefer to have hired help, but there is a feeling of independence in camping that is pleasurable if—and here that little "if" looms up like a word of ten syllables—you have a party composed of the proper ingredients. Our party was so composed. Two could make fun and two could enjoy it; one could kill more ducks with his big 7-gauge gun than all the rest, but he never bragged of it; one was a good cook, and another was willing to cut and drag firewood. Each fell into his place, and it was as perfect a party of four as it seems possible to organize.

Rowing down the lake, there was a distress call from the rear boat, and Downey signaled to me to halt, for John Fish and I were the oarsmen of the two boats, and I turned back. Mort had essayed a cast when his spoon with a triple hook lay behind him in the boat, and the result was disastrous. Fortunately I had a pair of wire-cutters in my creel, and they snipped off the protruding barbs, and then the two imbedded hooks were withdrawn; but during that trip Mort preferred to stand or lie upon one side. John explained to Mort the nature and uses of fish hooks, and wrote a few verses commemorating the event.

Did you ever see a loon sink without making a ripple? We did; and no doubt others have seen it, but I have no recollection of seeing it recorded. Our blind of brush and grass was as far out on Canoga Marsh as we could get it, and keep dry. The fleet of decoys bobbed at their anchors, some 30ft. outside the rushes. Downey and Mort had gone to the rear to thaw out and drink coffee, for legs would get stiff and fingers so numb that an hour in the blinds—enlivened by a jump in the boat to pick up the dead, or chase cripples—was about all the sport we wanted on one relief. John had just said: "There goes a flock of bluebills up the lake, too far out to see our decoys; mebbe they'll swing around and come down our way—" He touched my arm, and through the sedge I saw something rise from out the bosom of the lake, not clothed in white samite, nor mystic, nor wonderful, but just the head and neck of a loon, and then the back appeared among the stools. The bird did not get its body above water before its quick eye discovered that the fleet of decoys were not real ducks, and by the time John and I reached for our guns the sinking of the loon began. It takes longer to tell this than it did to act it, but that loon compressed itself and sank out of sight without making a ripple—not by a plunge and a dive, but by settling in the water before the two gunners could give him a welcome.

Pop! Out in the lake, a quarter of a mile away, he came up and swam off with a backward look, as if he said: "Wooden ducks! Yes, there's a man with a gun always near them; it's safer out here in midwater."

John said: "That's an old fellow; he's been among wooden ducks before, and may have been tickled by a few shot. He's chucklin' to himself now how he fooled us. Did you ever see anything so slick as the way he squeezed himself together and sunk? Never turned until he got below the surface, for fear he'd make a ripple. There's no duck that can do that."

"I saw a red-breasted sheldrake do nearly the same thing on the Mississippi River once; it didn't come up, like that loon, but it sank just the same."

"A sheldrake may do it," said John. "I don't say it can't, but I spoke of ducks; now a sheldrake is no more of a duck than a goose is; nor a loon, for that matter; their bills—." Downey and Mort came into the blind, and our going to the rear to thaw out deprived the scientific world of the ornithological observations of John Fish on the difference between ducks, loons and sheldrakes.

On one of these trips Mort Locke was disappointed in not receiving a new breechloading gun, and left the shooting to go to Rochester for it, and so lost two days. He had never used a gun of that kind, for they were not common in the early 70s, but he had the craze on, and really felt that he must get a change of gun to shoot against John's 7-gauge, which then was the most wonderful duck gun I had ever seen, and so off he went. John and I were alone, for Downey was to come back with Mort. We had some ducks hung in the shade, and John had killed about a dozen muskrats at intervals when the ducks were not flying. "Ever eat a muskrat?" asked John.

"Yes, among the Indians, where the unwashed son of the forest thrust his unmanicured hand into the camp-kettle and his guest could do the same or go hungry; but I was hungry, and it tasted good if there was an absence of napkins and finger-bowls."

"Let's cook some for Downey and Mort. Put in only the hindlegs, which look enough like duck's legs to pass. What d'ye say?"

When the hired boatman landed our friends at camp near sundown, he said he would "take a bite" and go back to Cayuga. Downey sniffed around and asked: "Got anything for supper? Haven't had a thing since breakfast." Mort was hungry enough, but confined his questions to the game killed, and so we sat down to the feast.

"Have some of this stew of sawbills'* legs? The breasts are fishy?" asked John, "but the legs when stewed with a root of wild celery are a delicacy."

Downey enjoyed them, and of course I did; for I was the cook. All went well until we were about to smoke, when Mort Locke thought it would be a pity to waste that last duck leg, and he fished it up. Alas! John had left the foot upon the leg, and it had evident claws! "Hello," said he, "what's this?"

"There!" exclaimed John, "if we didn't cook that duck leg that had a claw on it. The other leg was all right, web-footed just like any duck's foot; but I meant to have had that bird stuffed."

"It's a durned ole muskrat, that's what it is," said Mort; "but they were good, though. I wouldn't eat it now that I know what it is."

Downey made no comment until long after our return, and then one day he asked: "What kind of a joke was John trying to play on Mort; trying to get him to eat a muskrat?"

Central and western New York has so many fine lakes that the smaller ones are unnamed upon most maps, if they appear at all. Ontario county has three—Conesus, Honeoye and Hemlock—all tributary to Honeoye Creek and the Genesee River, and a drive of some fifteen miles would bring us to any of them. It was the time when the bees were working in the apple blossoms, and we drove up south to fish in Honeoye Lake among the hills which lend a charm to this beautiful water. The only fish in the lake which might possibly rise to a fly was the yellow perch, and so our outfit of lures comprised small frogs, metal spoons, a can of minnows, and those first principles which are dug in the garden. John was a firm believer in first principles, Mort in metal spoons, and I in minnows and frogs. The result was that John caught most fish, but only perch and bullheads; Mort took the greatest weight, all pickerel; while the frogs took some pickerel, and the minnows both pickerel and perch. Said John: "These perch keep biting as fast as I can take 'em off, bait again and throw out, and I don't see but I'm getting the most fun out of it, if you are getting bigger fish." And when the pickerel preferred rest to frogs, spoons or minnows Mort and I reverted to first principles for a while and toyed with the perch.

On Cayuga Lake John knew a grand spot for lake trout. In the days that we fished the lake I knew the ranges up and down and across the lake, but have forgotten them now. Inasmuch as John still drops his line there occasionally, since Canoga Marsh has been bought by a club, and his great 7-bore no more can awake the echoes as it drops a duck at a distance that used to discourage Mort Locke and the writer, the ranges of this favorite spot would not be recorded here if remembered. We had been followed by several boats one day for hours, and John had kept off his favorite spot, but after they had rowed around us and got the ranges they left, and we then pulled out to the trout grounds. Next morning three boats were anchored near where we had first fished and caught nothing, while we kept away from them and from the good spot. The day after this we were not watched, and when we came ashore at Union Springs we had twenty fine lakers that might have weighed 100lbs. in the aggregate, if a scale had been handy.

The fish were carefully inspected by the crowd and pronounced a grand catch for two men. One fellow said: "I dunno how 'tis. I've watched John Fish many a time, an' he seems to have luck wherever he goes, but when I get the ranges and anchor on the same spot the fish don't seem to be there. I dunno how 'tis."

A young man suggested that John had some new kind of bait.

"No, he hain't," said an old man, "I've looked over his minners (minnows), and they're jess a same as we allers use; he gets 'em down at the foot of the lake, fer I seed him buy 'em once."

"John Fish," said an athletic student from Cornell University, at the head of the lake, who was training for a rowing contest, "I'll give you this $10 bill if you'll give me the ranges of the place where you always get a lot of trout."

Said John: "Gentlemen, we will gladly give you any information we possess about the fishing spots in this lake. But what little we know is not worth buying. My friend and I did not come down here to make money, so please put up your purse. We came to get a little bite of fresh air from this beautiful lake and a few bites from the fish in it. We have neither information nor fish to sell. My friend is a scientific man who has come into western New York to study the geological conditions that produced the Cardiff giant which was recently found in Onondaga county, and in following the trend of the hills around this lake he pointed out the place which should naturally be the feeding ground of the lake trout; and he was correct."

"That's all right," said the student, "and the Cardiff giant is a solid man, but what we want to get at is where this great fishing place is. You won't sell the secret and offer to give it to us and then give us a story about the Cardiff giant and the trend of the hills. I've put up my money and you refuse it. I'll double it, if that's what you want."

"My friend," said John, "please don't get angry, and please believe me that we are not after money. Like my scientific friend, I believe that knowledge should be spread broadcast, and I had begun to tell you how we found the best fishing place in the lake, and where it is, when you interrupted me. With your permission I will proceed."

"My dear sir," said the student, "I had no intention of offending, and I beg your pardon. We are sportsmen who do not count dollars when we shoot and fish, and I think I speak for the whole party when I say that we will appreciate your kindness in giving us the ranges of the spot where you anchor and always have such great success in fishing. Pardon me if I have offended you in any way in my anxiety to acquire knowledge of the fishing spots."

"There has been no offense," said John, "because none was intended. You offered to buy what I did not care to sell. But I don't mind giving these ranges to all of you, if they are of use, as they seem to be. Row out into the lake until the white spire of the church in Cayuga is in direct line with that dead hemlock that you see on the hill away to the north of it, up above the sky-line. That's your range north and south."

"Yes, that's good."

"Then you see the flagstaff on the hotel here?"

"Sure!"

"And that great hillside across the lake where that gray horse is feeding?"

"Yes!"

"Well, after you row out and get the church steeple in line with the dead hemlock, just move your boat up and down until you're exactly in line with the flagstaff and the gray mare's tail." And so they learned the ranges of the fishing hole.

FRED MATHER.

* In the local parlance of central New York the hooded merganser is called the little sawbill to distinguish it from the larger sawbills or sheldrakes.

THE BOSTON FISHERMEN.

SALMON fishermen will be pained to learn of the death of William Andrew Browne. He has fished the Romayne for several seasons with Mr. E. C. Fitch, president of the American Watch Co., at Waltham. Mr. Browne was a Boston angler beloved by all who knew him. He died at Baltimore, March 26.

The salmon anglers are now much interested in the salmon pool at Bangor, Me. Several salmon have been taken, the season opening on Saturday, April 3, when Charles Bissell, of Brewer, took a salmon weighing 14½lbs. Since then two or three more have been taken; the fourth fish being taken on Monday, and weighing 15lbs. Since that time the heavy rain has filled the river with roil, and but little fishing has been done. The ice left the Penobscot on the 6th, four days earlier than last year, and the trout fishermen are figuring that the Maine trout lakes are going to be open earlier than last year for that reason. The interest in that subject begins to be very lively.

The Massachusetts trout fishermen have not continued to have the good luck that the season opened with. The Wakefield party, consisting of E. H. Wakefield, Jr., Edward Brooks and R. O. Harding, who fished Mr. Wakefield's preserve on the 2d, 3d and 4th, found the weather very cold. They caught an even dozen trout, however. Mr. Wakefield was to go down again to-day. He is determined to take more trout. No good catches of trout have been reported this week from the Cape, or anywhere in the State, for that matter.

Good brant shooting is being reported at Monomoy. Mr. Warren Hapgood and Walter B. Hill, with Messrs. Craig, of West Medford; Hall; S. Fairbanks, of Winchester; G. R. Seward, of Boston, and Webber, of Lynn, have returned from that preserve. A great many brant were flying, and when Mr. Hill left early in the week they had secured eight or ten, Mr. Hill getting his share, with Mr. Hapgood also among the fortunate ones. His shooting was very pleasing to all, by reason of his age. Later in the week the party secured brant enough to bring the score up to about forty—a very remarkable number for late years. What is termed the Boys' Party will leave for Monomoy on Wednesday of this week, and the five or six gunners go with great expectations.

The landlocked salmon fishermen are getting their tackle ready. The Dry Goods Party will be in camp on Sebago Lake, Me., on the 19th, which is a holiday in this State. The fishermen expect to find the ice out by that time, though up this writing the lake is ice-bound. A year ago the ice left that lake April 24, having started somewhat the Sunday previous. This clearing was eight days later than the year before, when the ice was all out April 16. In 1891 the ice left Sebago April 6. Mr. E. H. Wakefield, Jr., R. O. Harding and friends, will visit Dan Hole Pond, in New Hampshire, for landlocked salmon fishing as soon as the ice is out. Last year the ice went out of that pond April 24. This pond has a record of a salmon—taken with rod and reel in 1895—weighing 19½lbs. Last year the sportsmen had poor fishing here, but they will try again this year. The fishermen are also getting ready to fish Lake Auburn, Me., as soon as the ice is out. This lake is well stocked with landlocked salmon and brook trout, and some excellent fish are taken. But the lake is within three miles, by electric cars, of the two cities, Lewiston and Auburn, and fishermen of every grade throng its shores and waters. Hence many are disappointed, though the lake yields a goodly number of fish.

SPECIAL.

REMINISCENCES OF EXCITING SPORT.

In the great reception room of one of the handsomest and largest of the club houses with which Long Island abounds a party of fifteen or twenty gentlemen were assembled. It was the evening of the first day of the open season for trout fishing, an event to which the devotees of the beauty *Salvelinus* always look forward with the keenest anticipations. The weather of the early spring day, though pleasant, had been somewhat cold, and patches of ice were still left in the quiet nooks and corners of the ponds and streams.

The catch, however, had been very satisfactory, for the preserves that the club controlled were generously stocked with fish of goodly size and plumpness, and the after-dinner smoke with which the anglers were now regaling themselves seemed the crowning point of the day's enjoyment.

Seated in a semicircle before the rousing fire of oak and hickory logs which blazed cheerily in the great fireplace, the conversation of the men naturally teemed with reminiscences of adventure "by flood and field," and many were the good "fish stories" and hunting anecdotes that were exchanged before the hour arrived for retiring.

"Yes," said one of the group, at the conclusion of a thrilling narrative that had been given by one of the veterans of the club, "we, who have handled rod and gun for years, have all passed through many interesting episodes, and some of them were, of course, intensely exciting. I certainly have had my share of them, and they sometimes come back to memory with a strange vividness.

"Of these experiences an incident that occurred in my younger days while on a shark fishing trip at Nantucket is perhaps worth recalling this evening.

"I had hooked a large 'man eater," and with two of my companions was drawing him to the surface; the line used was, of course, a stout one, for the strength and weight of the shark are very great.

"Slowly we hauled up the fish; slowly he yielded, foot by foot, until his huge, horrible form appeared near the side of the yacht. I think I never saw anything more hideous and wicked than that shark, and his cruel eyes, his enormous mouth, armed with rows of the sharpest teeth, and the rage with which he snapped at the boat and lashed the water into foam, I shall never forget.

"Our skipper was just at the point of dispatching the brute when, turning downward with a sudden dart, the shark dived, and the line slipping through our hands permitted him to descend to the bottom again.

"As it was running out with almost lightning speed I was caught by the leg in a bight, into which I had incautiously stepped, and in an instant I was over the side and following the shark.

"It is utterly impossible for me to describe the sensations that I experienced, as I was drawn down deeper and deeper in the water. I could feel the pain from the rope about my leg, a pain that was increased by my companions holding the line and drawing upon it; but the pain was as nothing when compared with the terrible pressure upon my lungs and brain.

"Singularly enough, I did not entirely lose my presence of mind; I knew that nothing but a turn in the rope held me, and I thought that if I could in any way twist my leg around I should be released.

"But in vain; my struggles were useless, and everything began to grow dark.

"I must say that my sensations at this juncture were not unpleasant; the ringing in my ears, the pressure on my lungs, were forgotten and I seemed to be floating in a sort of dream.

"Of course the length of time that I remained in this condition was probably less than a minute, but it seemed almost eternity.

"Fortunately for me, before it was too late, the hook became detached from the shark and I was drawn to the surface by my friends and lifed into the yacht. I was not entirely unconscious, for I felt the shock of being laid upon the deck of the boat, but it was a pretty close call. My friends soon resuscitated me, and I was able to hobble ashore when we reached the dock, but I was obliged to use crutches for a week afterward.

"This, gentlemen, was my most exciting experience and I never want another like it. I will close my story by advising all who go shark fishing to be careful when they get a bite not to step into a bight of the line; it is not a knot, but it holds with all the tenacity of one."

"What an inordinate amount of salt water you must have swallowed," said another of the group who had been quietly throwing smoke rings across the room, "and how nauseating the recollection of it must be to you. Now I once had a somewhat exciting adventure, but it happened in fresh water, which is more agreeable to swallow; the story is hardly worth the telling, however—"

"Go on, go on," came from all parts of the room.

"Very well, then, since you insist upon it. I was at the time of this incident the guest of one of the lessees of a famous salmon river in Canada, and had the privileges of some of the choicest pools.

"Two of the best guides on the stream had been assigned to me, and I kept them and myself at work every day from morning until night. On the occasion to which I refer I had hooked a fine fish in a small pool, below which was a stretch of very wild rapids nearly a half mile in length. The salmon was strong and gamy, and I had quite a fight with him in the pool; but before he could be gaffed he started down the rapids, still securely hooked, and we followed him in the canoe. What a wild run that was, and how exhilarating it seemed as we rushed down the steep white incline of roaring water!

"At the foot of the rapids were numerous boulders, and the passage soon became more and more dangerous. I still held to my fish, however, trusting to the dexterity of my guides; but in one of the worst places the setting pole in the hands of the bow canoeman broke, the canoe crashed against a sharp ledge, and in an instant I was in the furious waters.

"I do not know how it happened, perhaps it was because I am a good swimmer; but I was carried down the current unhurt, save by a few bruises from the rocks, until I almost reached the verge of the great falls.

"At this juncture the outlook was grave indeed, for I knew that if I was carried over the crest nothing could save me; for the descent of upward of 40ft. down upon a ledge of jagged rocks would mean utter destruction.

"In some way, however, I was drawn near the shore, and I made the most strenuous efforts to effect a landing; but the force of the stream was too much for me, and I had about concluded that I was to be 'gathered in,' when I saw abreast of me and within my reach the gunwale of the nearly submerged canoe, which had drifted down the stream.

"Instinctively I seized it, and before the verge was reached the frail craft became firmly wedged between a boulder in the stream and the rocky shore, and, working my way to the inner side, I crawled out upon the ledge, where I sank completely exhausted.

"It was not long, however, before I was aroused by the voices of my guides. They had been more fortunate than I, and when the canoe struck they jumped upon one of the rocks, and leaping to others with the agility of accomplished river men, they reached the shore in safety.

"When they joined me they fished out the luncheon basket, which still remained in the canoe, and finding a bottle of brandy they gave me a cup, which soon revived me, and it was not long before we climbed up the bank and prepared for a long tramp through the woods to our camp. Before we started, however, we clambered down the cliff to the pool below the falls for the purpose of searching for such articles as might have floated down from the canoe.

"We had been there but a few moments when we saw a salmon jump. He was the fish that I had hooked, and we discovered that my line was still attached to him.

"Now comes the most incredible part of my story: The guides cut a long sapling, and attached to the end of it a hook, which they made from a forked stick, and wading out into the water they began dragging for my rod, which they assured me was there and being dragged about by the salmon; and soon, greatly to my surprise, they actually hooked it up uninjured, placed it in my hands, and I had the satisfaction after all of fighting my fish until he was conquered and landed."

"Oh, oh!" came from all over the room.

"It's a fact, gentlemen; I know it sounds 'fishy,' but it actually occurred; and you will believe me when I state that it is a common practice among the natives in some localities of Canada—those who have no rod and reel—to hook a salmon and throw their pole, which is a stout, dry sapling, into the water and let the fish exhaust itself; the sapling floats upon the water and offers just enough resistance to keep the salmon in motion, and he soon wears himself out in endeavoring to free himself."

"The story that we have just heard," said a short, florid, sandy-haired man, after the comments which it awakened had ended, "is very interesting to me. I have often wished that I might have the opportunity of giving battle to a big and vigorous salmon, but such has not been my good fortune, and I regret exceedingly that I cannot give a thrilling account of some hunting or fishing experience through which I have passed, but unfortunately I have had none.

"My angling has been limited to brook fishing for trout, and my hunting has been confined to snipe and partridge shooting; but I once had an adventure which was certainly exciting enough while it lasted.

"I have always been an enthusiastic canoeist, and the excursions I have taken, sometimes many days in length, are almost innumerable. I have always carried a camping outfit in my canoe, consisting of a compact little cooking kit and a small shelter tent; and when necessity compelled me—and sometimes even when it did not—I would stop at the close of a day's paddling, land at a promising spot and camp for the night.

"On one of these outings I found myself at sundown in a locality destitute of houses, and as I had worked steadily all day I concluded that I would land and prepare for a night's rest.

"I soon found a nice spot, where, running my canoe ashore, I stepped out upon the beach and proceeded to reconnoiter.

"Climbing up the bank of the river, I passed through a little growth of birches and maples, and came out upon a stretch of open land, which evidently served as a pasture.

"There were a few trees scattered about, and beneath one of them was a number of cattle. I did not pay much attention to them, but continued my investigations. At length, satisfied that the spot I had selected would prove desirable for a camping place, I began to retrace my steps; as I did so I noticed that one of the cattle had left the others and was following me.

"At intervals he would utter a low, hoarse bellow and paw the earth, throwing it into the air in clouds. I saw at once that I had an ugly bull to contend with, and began to hurry toward my boat.

"But the brute managed to get between me and the river, and I soon discovered that there was nothing left for me but to cut and run for one of the trees in the pasture.

"Gentlemen, I am sorry to say that I am not much of a sprinter. I am not built that way, but in the language of the novelists, 'fear lent wings to my feet,' and I give you my word I made a very quick dash for my objective point. Not a second, however, was there to spare, for as I dodged behind the tree the bull brought up on the other side of the trunk.

"He gave me no time to recover my wind, but sprang around the tree endeavoring to impale me with his horns, which I noticed were sharp to a degree. I see you are laughing, gentlemen—it was a ridiculous scrape to get into.

"Around the tree he darted, bellowing and growling savagely, and around to the other side I dodged, trying as well as I could to keep the trunk between us, and to a looker-on it would have been a comical sight indeed to see us waltzing in that old pasture.

"At last a favorable opportunity presented itself, and I sprang for a limb that was just within my reach. I succeeded in grasping it and was swinging myself up when the bull made a lunge, and one of his horns fastening in a portion of my clothing ripped it off as quick as a flash, the horn at the same time giving my leg a vicious rasping.

"It hurt abominably, but the pain turned my fear to anger. I was mad clear through, and longing for revenge; but I was powerless.

"Astride that limb I sat for a short time rubbing my leg and using, I am sorry to say, very profane language, the bull in the meantime hooking at the tree and now and then rearing on his hindlegs in his efforts to dislodge me, and so near me did he come in these attacks that I could almost have kicked him.

"As I sat there watching my enemy and rubbing my leg, my hand struck against a hard object in my hip-pocket; it was my whisky flask!

"I have read of the intense joy and gratitude with which shipwrecked mariners have found a spring of water, but I doubt if they felt a keener satisfaction than I did at my discovery. The flask was nearly full, and never did good old Bourbon taste as it did then; it was simply nectar. As I took a modicum an idea struck me, and a good one it proved to be.

"Pouring the liquor into the flask-cup until it was nearly full, I watched my opportunity, and when the bull reared for another stab at me I dashed the contents of the cup into his eyes

"The effect was simply magical. The beast gave a snort and bellow, and sidling away from the tree he pawed the earth, laid down upon the grass and rolled over, and performed all sorts of contortions, as if in the greatest agony.

"Seeing that my enemy was for a short time disabled, you may be sure that I quickly descended from my perch and hurried to my canoe; but I selected another camping place for the night, where no animals were being pastured."

Roars of laughter and applause followed this story. He was a pudgy little man, and the quaint manner in which he described his adventure was very mirth-provoking.

"A vicious bull or horse is a dangerous animal," said one of the gentlemen when quiet had been restored, "but neither of them is as bad as an ugly moose, for he is sometimes the incarnation of wickedness. I once had an adventure with one which came near costing me my life.
